THE
LONDON ENCYCLOPÆDIA.

VOL. XXI.

SPHEROID TO TEWKESBURY.

LONDON: J. HADDON, PRINTED AT THE
CASTLE STREET, LONDON.

J. Haddon, Printer, Castle Street, London.

THE

LONDON ENCYCLOPÆDIA,

OR

UNIVERSAL DICTIONARY

OF

SCIENCE, ART, LITERATURE, AND PRACTICAL MECHANICS,

COMPRISING A

POPULAR VIEW OF THE PRESENT STATE OF KNOWLEDGE.

ILLUSTRATED BY

NUMEROUS ENGRAVINGS, A GENERAL ATLAS,
AND APPROPRIATE DIAGRAMS.

Sic oportet ad librum, presertim miscellanei generis, legendum accedere lectorem, ut solet ad convivium conviva civilis. Convivator annittitur omnibus satisfacere; et tamen si quid apponitur, quod hujus aut illius palato non respondeat, et hic et ille urbane dissimulant, et alia fercula probant, ne quid contristent convivatorem. Erasmus.

A reader should sit down to a book, especially of the miscellaneous kind, as a well-behaved visitor does to a banquet. The master of the feast exerts himself to satisfy his guests; but if, after all his care and pains, something should appear on the table that does not suit this or that person's taste, they politely pass it over without notice, and commend other dishes, that they may not distress a kind host. Translation.

BY THE ORIGINAL EDITOR OF THE ENCYCLOPÆDIA METROPOLITANA,

ASSISTED BY EMINENT PROFESSIONAL AND OTHER GENTLEMEN.

IN TWENTY-TWO VOLUMES.

VOL XXI.

LONDON :

PRINTED FOR T. TEGG & SON, 73, CHEAPSIDE ;

R. GRIFFIN & Co., GLASGOW ; T. T. & H. TEGG, DUBLIN ; ALSO J. & S. A. TEGG,
SYDNEY AND HOBART TOWN.

1837.

THE LONDON ENCYCLOPÆDIA.

The SPHEROID, in geometry, is generated by the entire revolution of a semi-ellipsis about its axis. When the revolution is made round the largest axis, the spheroid is called prolate; and when round the shortest, oblate. This last is the figure of the earth, and probably of all the planets.

To obtain the solid dimensions of a spheroid, multiply continually together the fixed axis, the square of the revolving axis, and the number 52359877, or $\frac{1}{2}$ of 3.14159, and the last product will be the solidity; i. e. $\frac{1}{2} p t t c$ = the oblate, and $\frac{1}{2} p t c c$ = the oblong spheroid, where $p = 3.14159$, t = the transverse, and c = the conjugate axis of the generating ellipsis. Or, multiply the area of the generating ellipse by $\frac{2}{3}$ of the revolving axis, and the product will be the content of the spheroid; i. e. $\frac{2}{3} t A$ = the oblate, and $\frac{2}{3} c A$ = the oblong spheroid; where A is the area of the ellipse. *E. g.* Required the content of an oblate, and of an oblong spheroid, the axes being 50 and 30. Thus, $50 \times 30 \times 78539816 = 1178.09724$ = the area of the ellipse. And $1178.09724 \times \frac{2}{3} \times 30 = 23561.9448$ = the oblong spheroid; and $1178.09724 \times \frac{2}{3} \times 50 = 39269.908$ = the oblate one.

Dr. Hutton has demonstrated the rule above given in the following manner. Put $f = BI$ the fixed semi-axis, $r = IM$ the revolving

semi-axis of the spheroid, $a = SI$ any semi-diameter of the section NBM, $b = IK$ its semi-conjugate, $y = AE$ an ordinate to the diameter SI, or a semi-axis of the elliptic section AFC parallel to KL, and $z = EF$ its other semi-axis, also $x = EI$, s = the sine of the angle A E S, or of the angle K I S, to the radius 1, and $p = 3.14159$.

Then, by the property of the ellipse KSL, $aa : bb :: a - xx : bb \times \frac{a - xx}{a} = yy$;

and $b : r :: y : \frac{ry}{b} = z$. But the fluxion of the solid KACL is $psyz \dot{z} = \frac{psryy \dot{z}}{b}$, by writing

for z its value $\frac{ry}{b}$, = $pbsr \dot{x} \times \frac{aa - xx}{aa}$, by

substituting for yy its value $bb \times \frac{aa - xx}{aa}$, =

$pfrr \dot{x} \times \frac{aa - xx}{aaa}$, by putting for abs its

value rf ; and hence the fluent $pfrrr \dot{x} \times \frac{aa - \frac{1}{2}xx}{aaa}$, or $\frac{1}{2} pfrrr \times \frac{3aa - xx}{aaa}$, will be

the value of the frustum KACL; which, when EI or x becomes SI or a , gives $\frac{2}{3} pfrr$ for the value of the semi-spheroid KSL; or the whole spheroid = $\frac{1}{2} pFRR$, putting F and R for the whole fixed and revolving axes. Q. E. D.

Cor. 1.—From the foregoing demonstration it appears that the value of the general frustum KAEC L is expressed by $\frac{1}{2} pfrrr \dot{x} \times \frac{3aa - xx}{aaa}$.

And if for fr be substituted its value abs , the same frustum will also be expressed by $\frac{1}{2} pbrs \dot{x} \times \frac{3aa - xx}{aa}$.

Also, if for aa be put its value $\frac{5bxx}{bb - yy}$, the

last expression will become $\frac{1}{2} prs \dot{x} \times \frac{2bb + yy}{b}$,

or $\frac{1}{2} ps \dot{x} \times \left(2br + \frac{ryy}{b} \right)$; which, by writing

z instead of its value $\frac{ry}{b}$, gives $\frac{1}{2} ps \dot{x} \times (2br + yz)$ for the value of the frustum, viz. the sum of the area of the less end, and twice that of the greater, drawn into one-third of the altitude or distance of the ends.

And out of this last expression may be expunged any one of the four quantities b, r, y, z , by means of the proportion $b : r :: y : z$.

When the ends of the frustum are perpendicular to the fixed axis, then a is = f ; and the value of the frustum becomes $\frac{1}{2} p r r r \dot{x} \times \frac{3 f f - x x}{f f}$ for the value of the frustum whose ends are perpendicular to the fixed axis, its altitude being x .

And, when the ends of the frustum are parallel to the fixed axis, a is = r , and the expression for such a frustum becomes $\frac{1}{2} p f x \times \frac{3 r r - x x}{r}$.

Cor. 2.—If to or from $\frac{2}{3} pfrr$, the value of the semi-spheroid be added or subtracted, $\frac{1}{2} pfrrr \dot{x} \times \frac{3aa - xx}{aaa}$, the value of the general frustum KACL, there will result $\frac{1}{2} p f r r h h$

$\times \frac{3a-h}{aaa}$ for the value of a general segment, either greater or less than the semi-spheroid, whose height, taken upon the diameter passing through its vertex and centre of its base, is $h = a + x$.

When a coincides with f , the above expression becomes $\frac{1}{2} p r r h h \times \frac{3f-h}{ff}$ for the value of a segment whose base is perpendicular to the fixed axis. And here if we put R for the radius of the segment's base, and for rr its value $\frac{R R f f}{2 f h - h h}$, the said segment will become

$\frac{1}{2} p R R h \times \frac{3f-h}{2f-h}$. And when a coincides with r , the general expression will become $\frac{1}{2} p f h h \times \frac{3r-h}{r}$ for

the value of the segment whose base is parallel to the fixed axis. And if we put F, R , for the two semi-axes of the elliptic base of this segment, respectively corresponding or parallel to f, r , the semi-axes of the generating ellipse, when parallel to the base of the segment, and for $\frac{f}{r}$ and r substitute their values $\frac{F}{R}$ and $\frac{R R + h h}{2 h}$, the said frustum will be expressed by $\frac{1}{2} p F h \times \frac{3 R R + h h}{2 R}$, in which the dimensions of itself only are concerned.

Cor. 3.—A semi-spheroid is equal to $\frac{2}{3}$ of a cylinder, or to double a cone of the same base and height; or they are in proportion as the numbers 3, 2, 1. For the cylinder is $= 4 n f r r$ and the cone is $= \frac{2}{3} n f r r$, the semi-spheroid $= \frac{2}{3} n f r r$, and the cone $= \frac{1}{3} n f r r$.

Cor. 4.—When $f = r$, the spheroid becomes a sphere, and the expression $\frac{2}{3} n f r r$ for the semi-spheroid becomes $\frac{2}{3} n r^3$ for the semi-sphere. And, in like manner, f and r being supposed equal to each other in the values of the frustums and segments of a spheroid, in the preceding corollaries, will give the values of the like parts of a sphere.

Cor. 5.—All spheres and spheroids are to each other as the fixed axes drawn into the squares of the revolving axes.

Cor. 6.—Any spheroids and spheres, of the same revolving axis, as also their like or corresponding parts cut off by planes perpendicular to the said common axis, are to one another as their other or fixed axes. This follows from the foregoing corollaries.

Cor. 7.—But if their fixed axes be equal, and their revolving axes unequal, the spheroids and spheres, with their like parts terminated by planes perpendicular to the common fixed axis, will be to each other as the squares of their revolving axes.

Cor. 8.—An oblate spheroid is, to an oblong spheroid generated from the same ellipse, as the longer axis of the ellipse is to the shorter. For if T be the transverse axis, and C the conjugate; the oblate spheroid will be $= \frac{2}{3} n T^2 C$, and the oblong $= \frac{2}{3} n C^2 T$; and these quantities are in the ratio of T to C .

Cor. 9.—And if about the two axes of an ellipse be generated two spheres and two spheroids, the four solids will be continual proportionals, and the common ratio will be that of the two axes of the ellipse; that is, as the greater sphere, or the sphere upon the greater axis, is to the oblate spheroid, so is the oblate spheroid to the oblong spheroid, so is the oblong spheroid to the less sphere, and so is the transverse axis to the conjugate. For these four bodies will be as $T^3, T^2 C, T C^2, C^3$, where each term is to the consequent one as T to C .

To find the content of a universal spheroid, or a solid conceived to be generated by the revolution of a semi-ellipse about its diameter, whether that diameter be one of the axes of the ellipse or not. 1. Divide the square of the product of the axes of the ellipse by the axis of the solid, or the diameter about which the semi-ellipse is conceived to revolve; multiply the quotient by $\cdot 5236$, and the product will be the content required. That is, $\frac{T^2 C^2}{d} \times \cdot 5236 =$

the content; T and C being the transverse and conjugate axes of the ellipse, and d the axis of the solid.

Or, 2. The continual product of $\cdot 5236$, the diameter about which the revolution is made, the square of its conjugate diameter, and the square of the sine of the angle made by those diameters, the radius being 1, will be the content. That is, $d c c s s \times \cdot 5236 =$ the content; c being the conjugate diameter to d , and s the sine of the angle made by the diameters. For the demonstration of this rule see Hutton, ubi infra. Hence, if $d = T$, the rule becomes $\frac{1}{2} p T C^2$ for the oblong spheroid; and, if $d = C$, it will be $\frac{1}{2} p C T^2$ for the oblate spheroid: and if T, C , and d , be all equal, the rule will be $\frac{1}{2} p d^3$ for the sphere. See Hutton's Mensuration.

Dr. Halley has shown, that in a sphere, Mercator's nautical meridian line is a scale of logarithmic tangents of the half complements of the latitudes. But, as the earth has been found to be a spheroid, this figure will make some alteration in the numbers resulting from Dr. Halley's theorem. Mr. Maclaurin has therefore given us a rule, by which the meridional parts to any spheroid may be found with the same exactness as in a sphere.

SPHERUS, a Greek philosopher, a disciple of Zeno of Cyprus, who flourished about A. A. C. 243. He came to Sparta in the reign of Agis III. and Cleomenes III., and opened a school for philosophy.—Plut. Diod.

SPHEX, ichneumon wasp, or savage, a genus of insects belonging to the order of hymenoptera. See ENTOMOLOGY. The mouth is armed with entire jaws, but contains no tongue; the mandibles are horny, crooked, dentated; the lip horny, the apex membranaceous. The palpi or feelers are four. The antennæ have from ten to sixteen joints. The wings of both sexes are extended without folds, and laid horizontally on the back. The sting is sharp, and concealed within the abdomen. There are ninety-seven species. The manner of living is different in the various species, and so is the general form of the body and their haunts; but though the

method of life be utterly different, yet the same manners appear innate and inherent in all. They agree in being the fiercest of all flies: they will attack insects much larger than themselves, and this whether they be defenceless or armed, as they are provided with a sting. The strength in all this savage kind is great; their jaws are hard and sharp, and in their sting lies a poison suddenly fatal to the creatures with whom they engage. The savage seizes hardily on the animal he attacks, and gives a stroke of amazing force; after which he falls down as if himself were killed, but it is to rest from his fatigue, and enjoy his victory. He keeps a steady eye on the creature he has struck till it dies, which happens in a few minutes, and then drags it to the nest to feed the young. The number of other insects they destroy is scarcely to be conceived; the mouth of their cave is like that of a giant in the days of yore, strewed with the remains of prey. The eyes, the filament that serves as a brain, and a small part of the contents of the body, are all the savage eats, and he will kill fifty for a meal. Of this numerous genus only two are natives of Britain and Ireland, viz.

1. *S. cribraria* is black, with yellow ringlets on the abdomen; the antennæ are short, and turned backwards; the fore legs are broad, with an appendix like a shield. 2. *S. viatica* is black; the antennæ are short and thick; the first three segments of the abdomen red brown; the pedicel is short; the length half an inch.

SPHINCTER, in anatomy, a term applied to a kind of circular muscles, or muscles in form of rings, which serve to close and draw up several orifices of the body, and prevent the excretion of the contents. See **ANATOMY**.

SPHINX, *n. s.* Gr. σφίγξ. Defined below.

The *sphinx* was a famous monster in Egypt, that remained by conjoined Nilus, having the face of a virgin, and the body of a lion.

Peacham on Drawing.

SPHINX, or **SPHYNX**, in the mythology, a monster which had the head and breasts of a woman, the body of a dog, the tail of a serpent, the wings of a bird, the paws of a lion, and a human voice. It sprang from the union of Orthos with the Chimæra, or of Typhon with Echidna. The sphinx had been sent into the neighbourhood of Thebes by Juno, who wished to punish the family of Cadmus, which she persecuted with immortal hatred; and it laid this part of Bœotia under continual alarms, by proposing enigmas, and devouring the inhabitants if unable to explain them. In the midst of their consternation, the Thebans were told by the oracle that the sphinx would destroy herself as soon as one of the enigmas she proposed was explained. In this enigma she wished to know what animal walked on four legs in the morning, two at noon, and three in the evening. Upon this Creon king of Thebes promised his crown and his sister Jocasta, the widow of king Laius, in marriage to him who could deliver his country from the monster by a successful explanation of the enigma. It was at last explained by Œdipus, who observed that man walked on his hands and feet in the morning of life, at the noon of life he walked erect, and in the evening of his days he supported his infir-

mities upon a stick. See **JOCASTA** and **OEDIPUS**. The sphinx, upon this explanation, dashed her head against a rock, and expired. Among the Egyptians the sphinx was the symbol of religion, by reason of the obscurity of its mysteries; and on the same account the Romans placed a sphinx in the pronaos or porch of their temples. Sphinxes were used by the Egyptians to show the beginning of the water's rising in the Nile; with this view, as it had the head of a woman and body of a lion, it signified that the Nile began to swell in July and August, when the sun passes through the signs of Leo and Virgo. There are several of these still to be seen; one in particular, near the pyramids, much spoken of by the ancients, being of a prodigious size, and cut out of the rock; the head and neck appear only at present, the rest of the body being hid in the sand. This, according to Thevenot, is twenty-six feet high, and fifteen feet from the ear to the chin; but Pliny assures us, the head was no less than 102 feet in circumference, and sixty-two feet high from the belly, and that the body was 143 feet long, and was thought to be the sepulchre of king Amasis. See **PYRAMIDS**. The learned Mr. Bryant (in his *Ancient Mythol.* vol. iii. p. 532), observes that the sphinx seems to have been originally a vast rock of different strata; which, from a shapeless mass, the Egyptians fashioned into an object of beauty and veneration. The Egyptians used this figure in their buildings; from them the Greeks derived it, and afterwards improved it into an elegant ornament. It is also frequently used in modern architecture. The sphinx of the Egyptians is said in the *Asiatic Researches*, vol. ii. p. 334, to have been found in India. Colone Pearce was told by Murari Pandit, a man of learning among the Hindoos, that the sphinx, there called singh, is to appear at the end of the world, and as soon as he is born will prey on an elephant: he is therefore figured seizing an elephant in his claws; and the elephant is made small, to show that the singh, even a moment after his birth, will be very large in proportion to it. But in opposition to this account, given by Murari Pandit, the late Sir William Jones, the learned and illustrious president of the Asiatic Society, was assured by several Brahmins that the figure taken for a sphinx was a representation of a lion seizing a young elephant.

SPHINX, in entomology, hawk-moth; a genus of insects belonging to the order of lepidoptera. The antennæ are shaped somewhat like a prism, and are more slender at each end than at the middle. The tongue is generally thrust out: the two palpi are bent back, and the wings deflexed. The name sphinx is given to this genus on account of the singular attitudes of their caterpillars, who apply the hinder part of their body to a branch of a tree, holding the rest of it erect, like the fabulous sphinx. Most of them spin their cod under ground, making them up with small parcels of earth and grains of corn interwoven with threads. The sphinxes fly either early in the morning or after sunset in the evening. They fly heavily and sluggishly, often emitting a kind of sound. There are about 165 species already discovered, of which ten are found in Great Britain and Ireland: viz.—

1. *S. atropos*, jessamine hawk-moth. The wings are entire; the trunk long, spiral. Above, first wings brown, clouded with gray and yellow, and a yellowish spot in the centre; second, yellow, with two waved transverse stripes. The abdomen is yellow, with seven black brown belts. The thorax marked like a Death's head, whence the name, from *Atropos*, the third and last of the Fatal Sisters, who cuts the thread of life. The length is two inches. Caterpillar very large, yellow, with six green and orange oblique belts, and a posterior horn.

2. *S. convolvuli*, unicorn, or bindweed hawk-moth. The antennæ are long and thick; the trunk very long and spiral. Above, body marked with black and red belts; wings entire, brown-gray, with black zig zag transverse lines. The breadth three inches. Caterpillar smooth, green, with a posterior horn.

3. *S. elpenor*, elephant moth. The wings are angular, entire. Above, first wings striped transversely with red and green: second, black at the base, and red outwards. The body red and green. Caterpillar smooth, brown and yellow, with a posterior horn, and a snout like a hog. It lives on vines, *convolvulus*, &c.

4. *S. filipendulæ*, burnet moth. The antennæ, legs, and body, are black. Second wings red, with a greenish border. First wings bluish-green, with six red spots, in pairs. Length eight lines. Caterpillar yellow, with black spots. It lives on grass.

5. *S. ligustri*, privet hawk-moth. The antennæ are long, thick, and brown. Trunk long, spiral. First wings two inches long, narrow, entire, brown; second, short, red, with black bars. The abdomen is red, with black rings. Caterpillar smooth, yellow-green, with a posterior horn.

6. *S. ocellata*, eyed willow hawk-moth. There is no trunk; the wings are indented. Above, first wings dark and light brown, marbled; second, red, with a large yellow black eye. Beneath, a large red triangle from the base of the first wings. The breadth one inch and a half. Caterpillar smooth, green, with oblique white lines on the sides, and a posterior horn. The eggs are green; it lives on willows.

7. *S. populi*, poplar hawk-moth. The wings are scalloped, bluish-gray, and waved with dark lines. On the first wings a long white spot, and the base of the second red brown. Wings reversed. Length one inch. A long spiral trunk caterpillar, green, smooth, with oblique white spots, and a posterior horn. It lives on poplars and willows.

8. *S. stellatarum*, large bee-moth. The antennæ are thick, towards the ends brown. The trunk is spiral; the wings are short and entire; the body is thick, brown, and hairy. First wings are brown, waved; second, red brown. It resembles a large bee. Caterpillar smooth, with a posterior blue horn, tipped with red. It lives on gallium.

9. *S. tiliæ*, lime hawk-moth. No trunk; the wings are scalloped; the antennæ are white on the upper side, yellow on the under. Above, first wings gray-brown, with two irregular large green spots; second wings orange. Beneath, greenish-

gray. Caterpillar green, shagreened, with a posterior horn.

10. *S. tipuliformis*, small bee-moth. The thorax is yellow beneath; the wings are short, with black veins. The abdomen black, bearded, yellow at the extremity. Caterpillar on the *lonicera*.

SPHINX, in zoology. See *SIMIA*.

SPHÆRULITE, in mineralogy. Colors brown and gray. In imbedded roundish balls and grains. Glimmering. Fracture even, splintery. Opaque. Scratches quartz with difficulty. Brittle. Specific gravity 2.4 to 2.5. Nearly infusible. It occurs in pearlstone and pitchstone porphyries, in the vicinity of Glasshütte near Schemnitz; and in the pitchstone of Meissen.

SPHONDYLIIUM, in anatomy, one of the vertebrae of the back.

SPHRAGIDIUM, a famous cave of Bœotia, in Mount Citheron.—Paus. ix. c. 3.

SPIAL, *n. s.* Fr. *espial*. A spy; scout; a watcher. Obsolete.

His ears be as *spials*, alarum to crie.

Tusser's Husbandry.

He privy *spials* placed in all his way,

To weet what course he takes, and how he fares.

Spenser.

Their trust towards them hath rather been as to good *spials* and good whisperers, than good magistrates and officers.

Bacon.

For he by faithful *spial* was assured

That Egypt's king was forward on his way.

Fairfax.

SPICA, in botany. See *BOTANY*.

SPICE, *n. s.* & *v. a.* } Fr. *espices*; Italian
SPICER, *n. s.* } *specci*, of Lat. *speci*.

SPICERY. } A vegetable production, fragrant to the smell, and of pungent taste; an aromatic substance used in sauces: to season with spice: a spicer is a dealer in spice: spicery is the commodity or depository of spices.

Dangerous rocks,
Which, touching but by gentle vessel's side,
Would scatter all the *spices* on the stream.

Shakspeare.

Is not manhood, learning, gentleness, and virtue,
the *spice* and salt that seasons a man?

Id. Troilus and Cressida.

His mother was a votress of my order,
And in the *spiced* Indian air by night
Full often she hath gossip'd by my side.

Shakspeare.

Their camels were loaden with *spicery*, and balm,
and myrrh.

Raleigh's History of the World.

Names have been derived from occupations, as
Salter and *Spicer*.

Camden.

She in whose body
The western treasure, eastern *spicery*,
Europe and Africa, and the unknown rest,
Were easily found.

Donne.

These hymns may work on future wits, and so
May great-grandchildren of thy praises grow,
And so, though not reviv'd, embalm and *spice*
The world, which else would putrify with vice. *Id.*
With a festival

She'll first receive thee; but will *spice* thy bread
With flowrie poysons.

Chapman.

So in the wicked there 's no vice,
Of which the saints have not a *sp'ce*.

Hudibras.

What though some have a fraught
Of cloves and nutmegs, and in cinnamon sail,

If thou hast wherewithal to *spice* a draught,
When griefs prevail? *Herbert.*

Off at sea north-east winds blow
Sabean odour, from the *spicy* shore
Of Araby the blest; with such delay
Well pleased they slack their course; and many a
league,
Cheered with the grateful smell, old ocean smiles.

Milton.
High sauces and rich *spices* are fetched from the
Indies. *Baker.*

It containeth singular relations, not without some
spice or sprinkling of all learning.

Browne's Vulgar Errors.
Garlick, the northern *spice*, is 'in mighty request
among the Indians. *Temple.*

For them the Idumean balm did sweat,
And in hot Ceilon *spicy* forests grew. *Dryden.*
The *spicery*, the cellar and its furniture, are too
well known to be here insisted upon.

Addison on Italy.
The regimen in this disease ought to be of *spicy*
and cephalick vegetables, to dispel the viscosity.

Arbutnot on Diet.
Under southern skies exalt their sails,
Led by new stars, and borne by *spicy* gales! *Pope.*

SPICK AND SPAN. Span-new is used by Chau-
cer, and is supposed to come from Saxon *spannan*
to stretch; Lat. *expandere*: whence span. There is
also a Swedish *sping span*, meaning every bit.
Span-new is therefore originally used of cloth
new extended or dressed at the clothiers, and
spick and span is newly extended on the spikes
or tenters; it is, however, a low word. Quite
new; now first used.

While the honour thou hast got
Is *spick and span* new, piping hot,
Strike her up bravely. *Butler.*
They would have these reduced to nothing, and
then others created *spick and span* new out of nothing.
Burnet.

I keep no antiquated stuff;
But *spick and span* I have enough. *Swift.*

SPICKNEL, OR SPIGNEL. See **ATHAMANTA.**
SPICULA. See **BOTANY.**

SPIDER, n. s. Skinner thinks this word
softened from *spinder*, or *spinner*, from *spin*.
Junius, with his usual felicity, dreams that it
comes from Gr. *σπιζειν*, to extend; for the spider
extends his web. Perhaps it comes from Dutch
spieden, Dan. *speyden*, to spy, to lie upon the
catch. Sax. *ḡor, ḡora*, is a beetle, or properly
an humble bee, or stingless bee. May not spider
be *spy dor*, the insect that watches the *dor*?
Johnson. Sax. *spin ætær*.—Thomson. From
spin, and *æter*, venom. The animal that spins
a web for flies.

More direful hap betide that hated wretch,
Than I can wish to adders, *spiders*, toads. *Shakspeare.*

The *spider's* web to watch we'll stand,
And, when it takes the bee,
We'll help out of the tyrant's hand
The innocent to free. *Drayton.*

Insidious, restless, watchful *spider*,
Fear no officious damsel's broom;
Extend thy artful fabrick wider,
And spread thy banners round my room:
While I thy curious fabrick stare at,
And think on hapless poet's fate,
Like thee confined to noisome garret,
And rudely banished rooms of state. *Lit'leton.*

The *spider's* touch how exquisitely fine!
Feels at each thread, and lives along the line. *Pope.*

SPIDER, in entomology. See **ARANEA** and
ENTOMOLOGY.

SPIDER, SHEPHERD. See **PHALANGIUM.**
SPIDERWORT, GREAT SAVOY, a species of
HEMEROCALLIS.

SPIERINGS (II.), an eminent landscape
painter, born at Antwerp, about 1633. His man-
ner of designing was agreeable, his touch deli-
cate, and his coloring natural.

SPIERS (Albert Van), an historical painter,
born at Amsterdam in 1666. After studying in
Italy he returned to his native city, where he ac-
quired great fame. He died in 1718.

SPIGEIA, worm grass, in botany, a genus
of plants belonging to the class of pentandria,
and order of monogynia; natural order forty-
seventh, stellate: cor. funnel-shaped: caps. di-
dymous, bilocular, and polyspermous. There are
two species; 1. *S. anthelmia*, has a herbaceous
stem, and its highest leaves are fourfold. 'The
effects of this medicine,' says Dr. Browne, 'are
these:—It first procures sleep, almost as cer-
tainly, and in an equal degree, with opium: the
eyes seem to be distended, and sparkle as it were
before the eruption of the small-pox or measles,
which may be easily observed after the sleep is
over; the pulse grows regular and rises, the fever
cools, the symptoms appear more favorable, and
the worms are generally discharged by the use
of the subsequent purgative (if not before) in
great quantities, often above 100 at a time; but
when a few only come away, which is seldom,
and these alive, the same doses are again repeated,
which seldom or never fail. I never saw this
medicine fail when there was the least probability
of success; nay, often prove successful when
there was not the least reason to expect it. I
have been, however, cautious in ordering it for
children; for though I never knew it at all hurt-
ful, its effect upon the eyes has often deterred
me from ordering it to children, whose fibres are
weak and relaxed, and in whom the fevers from
this source are seldom so vehement as to hinder
the administration of other medicines, likely as
effectual in other cases of this nature. This plant
is generally had in low dry lands, after they have
been turned up some months, and after great
rains; its taste is herbaceous, and somewhat
clammy; its growth is soft and sudden; its stalk
hollow, smooth, and roundish. Its herbaceous
taste and sudden growth would alone make me
think it capable of little or no action, had not
hundreds of careful observations satisfied me to
the contrary.'

2. *S. Marilandica*, perennial worm-grass, or
Indian pink. The best description of this plant
which we have seen is given by Dr. Woodville
in his Medical Botany; a work which exhibits a
complete systematic view of the medicinal effects
of vegetables. Its stem is four cornered; all the
leaves opposite. Dr. Garden, in a letter to the
late Dr. Hope, professor of botany in the univer-
sity of Edinburgh, dated 1763, gives the follow-
ing account of the virtues of this plant:—'About
forty years ago the anthelmintic virtues of the
root of this plant were discovered by the Indians;

since which time it has been much used here by physicians, practitioners, and planters; yet its true dose is not generally ascertained. I have given it in hundreds of cases, and have been very attentive to its effects. I never found it do much service, except when it proved gently purgative. Its purgative quality naturally led me to give it in febrile diseases which seemed to arise from viscidities in the primæ viæ; and, in these cases, it succeeded to admiration, even when the sick did not void worms. I have of late, previous to the use of the Indian pink, given a vomit, when the circumstances of the case permitted it; and I have found this method to answer so well that I think a vomit should never be omitted. I have known half a drachm of this root purge as briskly as the same quantity of rhubarb; at other times I have known it, though given in large quantities, produce no effect upon the belly: in such cases it becomes necessary to add a grain or two of sweet mercury, or some grains of rhubarb; but the same happy effects did not follow its use in this way, as when it was purgative without addition. The addition, however, of the purgative renders its use safe, and removes all danger of convulsions of the eyes, although neither ol. rutæ sabine, nor any other nervous substance, is given along with it. It is, in general, safer to give it in large doses than in small; for from the latter more frequently the giddiness, dimness of the sight, and convulsions, &c., follow: whereas from large doses I have not known any other effect than its proving emetic or violently cathartic. To a child of two years of age, who had been taking ten grains of the root twice a-day, without having any other effect than making her dull and giddy, I prescribed twenty-two grains morning and evening, which purged her briskly and brought away five large worms. After some months an increased dose had the same good effect. I prefer the root to the other parts of the plant; of which, when properly dried, I gave from twelve to sixty or seventy grains in substance. In fusion it may be given to the quantity of two, three, or four drachms, twice a day. I have found that, by keeping, the plant loses its virtue in part; for forty grains of the root which has not been gathered about two months will operate as strongly as sixty which has been kept for fifteen months.' In Dr. Garden's subsequent letters, addressed to Dr. Hope, in 1764 and 1766, the efficacy of this root in worm cases is further confirmed; and he observes that the root keeps better than he at first thought (having lately used it several years old with great success). In what he calls continued or remitting low worm fevers, he found its efficacy promoted by the addition of rad. sepentar. virg.

SPIGELIUS (Adrian), an eminent anatomist, surgeon, and botanist, born at Brussels in 1578. He became professor of anatomy and surgery at Padua. The senate of Venice honored him with the order of St. Mark. He died 1625. His works on these branches of science were printed at Amsterdam, in 3 vols. folio, 1645.

SPIGNA, or **SPIGNO**, a town and castle, and ci-devant marquise of Italy, in the late duchy of Montferrat; now annexed to France, and included in the department of Marengo; seated

on the Belbo, between the Aqua and the Savona; forty miles south-east of Turin. Long. 8° 26' E., lat. 44° 45' N.

SPIGNEL, *WILD*, a species of seseli.

SPIGOT, *n. s.* Dut. *spijker*. A pin or peg put into the faucet to keep in the liquor.

Base Hungarian wight, wilt thou the *spigot* wield?
Shakspeare.

Take out the *spigot*, and clap the point in your mouth.
Swift.

SPIKE, *n. s.* & *v. a.* Lat. *spica*. An ear of corn: hence a long nail; a species of lavender: to fasten with nails.

For the body of the ships, no nation equals England for the oaken timber; and we need not borrow of any other iron for *spikes* or nails to fasten them.

Drawn up in ranks and files, the bearded *spikes*
Guard it from birds, as with a stand of pikes.
Bacon.
Denham.

Suffering not the yellow beards to rear,
He tramples down the *spikes*, and intercepts the year.
Dryden.

Lay long planks upon them, *spiking* or pinning them down plank.
Mortimer's Husbandry.

They long planks upon them, pinned or *spiked* down to the pieces of oak on which they lie.

He wears on his head the corona radiata, another type of his divinity: the *spikes* that shoot out represent the rays of the sun.
Moxon's Mechanical Exercises.
Addison.

A youth, leaping over the *spiked* pales, was suddenly frighted down, and in his falling he was caught by those *spikes*.
Wiseman.

The gleaners,
Spike after *spike*, their sparing harvest pick.
Thomson

The oil of *spike* is much used by our artificers in their varnishes, but it is generally adulterated
Hill's Materia Medica.

SPIKE, OIL OF, an essential oil distilled from lavender, and much used by the varnish makers and the painters in enamel.

SPIKENARD, *n. s.* Lat. *spica nardi*. A plant, and the oil or balsam produced from the plant.

A woman, having an alabaster box of ointment of *spikenard*, brake and poured it on his head.
Mark xiv. 3.

He cast into the pile bundles of myrrh, and sheaves of *spikenard*, enriching it with every spicy shrub.
Spectator.

It grows plentifully in Java. It has been known to the medical writers of all ages.

Hill's Materia Medica.

SPIKENARD. See **NARDUS**.

SPIKENARD, CELTIC, a species of valeriana.

SPIKENARD, FALSE, a species of lavandula.

SPIKENARD, INDIAN, or TRUE. See **NARDUS**. The Indian or True *Spikenard* was discovered in 1786, and announced in the Philosophical Transactions for 1790: yet Mr. Lee, in his Introduction to Botany, p. 330, published in 1794, says it is still 'unknown.'

SPIKENARD, PLOUGHMAN'S. See **BACCHARIS**. It is also the name of a species of Conyza.

SPIKENARD, WILD, a species of Asarum.

SPIKE-ROLLER, in agriculture, a useful implement of the roller kind, introduced by Mr. Randall of York. It has been found of much advantage in bringing stiff cloddy lands into a

state of suitable pulverization and fineness of mould for being sown. It is likewise employed in a beneficial manner on sward-land that is worn out and mossy, by preparing it for the application of earthy composts and grass-seeds. But it is remarked by the inventor that in this business the roller must go up and down till the swarth and ground are perfectly well broken up: this being done, the seeds of clover, trefoil, and rye-grass, or any other mixed with them, must be sown in the usual way and quantity; then the compost must be spread over the seeds so as to cover them; and a common barley-roller, with a thorn-bush fastened to it, must follow, and the ground be shut up, lest the cattle should do harm by treading. In respect to this sort of roller the dimensions in length were seven feet, the diameters at the ends eighteen inches, and the whole cylinder made of the heart of oak; and when the irons were burnt in, and the man seated on the box designed for that purpose, the weight of the whole was about a ton. But the blunt ends of the irons were opposed to the clods, and run more taper, till they came to the surface of the cylinder, into which the irons were burnt, and inserted about three inches, which was their length above the surface of the roller, and which he always found very sufficient to crush the hardest clod that ever came in their way. Had he, indeed, attempted to go on the ground when the soil was not perfectly dry, this position of the irons would have carried the clods round with the roller; for it is not its province to squeeze, but crush. Nor indeed can a man do more harm to his ground than going upon it, when it is not quite dry, with a roller constructed in this way. He had the irons fixed in four inches asunder, in the first row, from end to end. The second row began just between the first and second irons of the first row. The third row was like the first; and the fourth like the second. Then alternately for the whole surface of the cylinder, as nearly as possible, the irons were four inches asunder in each individual row; and four inches from row to row, as nearly as the superficies of the cylinder would permit. He does not know how to convey a juster idea of the shape of the irons than to call them ox-harrow teeth, or those of a very large harrow; for when he sent for the workman he desired him to make so many of this denomination six inches in length, and burn the small end three inches into the wood. This is a roller that requires a strong team in performing its work.

In addition to these uses it has been suggested that it may likewise be very useful in preparing clay for the making of canals, or pieces of water: for where, as sometimes happens, the clay grows dry, and will not admit of being duly tempered for use, without great pains in breaking it, a very large quantity may very soon be reduced to the requisite fineness, by spreading it on hard ground in a due thickness, and passing this roller a few times over it. In extensive works much trouble and labor may sometimes be saved by this means, and the clay prepared in a manner that will answer the purpose much more effectually. It may also be noticed that this is a sort of tool which no farm, where the land is a stiff clay, or in the

least liable to clot, should want: for besides the constant advantage of saving labor, and bringing land to a better condition for any kind of sowing than the plough and harrow, with any assistance of the work of hands, can make it; in favorable seasons, and under certain circumstances, the loss of the whole crop, by an otherwise unavoidable delay beyond the seed-time, may be with certainty prevented.

This implement may likewise be employed to assist in reducing the half-burnt turf of burnt-land, which requires much labor as commonly done by hand; but by going over the land several times with the spike-roller, and harrowing it with heavy harrows alternately, to pull up the turfs, or ploughing them up, they may be reduced fine in a much shorter time, and at a much less expense, than by beating or breaking them by hand. The mode of constructing the tool, in the common manner, has been already shown.

As an improvement in this implement it has been suggested, in order to prevent its tearing up the ground, and the great stress that is upon the frame in turning, to have it divided into two parts. Let the ends of each part be bound with narrow, but strong, bands of iron, and let the spikes at the ends be placed close to them; let each part have a separate frame; but let the cheeks, in which the inward gudgeons turn, be made of iron plates, about two inches wide above and four where the gudgeons enter; the thickness, a common flat bar of iron; and these fixed in any firm manner to two cheeks of wood, reaching down just to the bands, and of such a thickness at bottom as not to interrupt the spikes. Let the inward gudgeons be made with quite flat heads to prevent their slipping out in working, and bring the two ends of the roller nearer together, which is of consequence, as the fewer clots will be missed in working. Let the frames be joined together by four eyes, like those of a small gate, two at one end, about five or six inches apart; the two at the end of the other to take place just within them, an iron pin being put through all four and keyed. Let the thills be placed just on the middle of each frame, and a bar of wood just behind the horse to strengthen them; the bar sawed through in the middle, and joined by a strong flat hinge; one side made to hasp upon a staple kept down with a wooden clet. This gives the whole proper play in working.

The spikes are about four inches without and three within the wood: the thickness of the roller and number of spikes may be determined, in some measure, by the nature of the soil it is to work upon. Thus formed it will be found, it is said, next to the plough, the most useful instrument in tillage, not only in reducing a stiff soil, but, with a bush at its tail, to cover the seed, when sown, much more effectually, and in a better manner, than a harrow, as it turns up the earth light and fine behind it; and, though seemingly unwieldy, will turn with ease, and may be worked with one, two, or three horses at most, upon any land that is of a proper dryness to work upon.

SPILANTIUS, in botany, a genus of plants,

belonging to the class of syngenesia, and to the order of polygamia æqualis. The common calyx is erect; the leaflets numerous, sub-equal, and oblong, the two exterior being longer than the rest. The compound corolla is uniform and tubular; the florets are hermaphrodite and equal; the proper corolla is funnel-shaped. The filaments are five in number, and short. The antheræ cylindrical and tubular. The seeds are vertical, oblong, flat, and covered with chaff. The receptacle is paleaceous and conical. There are seven species, viz. 1. *S. acmella*; 2. *atriplicifolia*; 3. *insipida*; 4. *oloracea*; 5. *pseud-acmella*; 6. *salivaria*; and, 7. *urens*.

SPILBERG (John), an historical and portrait painter, born at Dusseldorp in 1619. He was painter to the prince Palatine, and died in 1691.

SPILBERG, (Adriana), daughter of John, was born at Amsterdam, in 1646, and learned painting under her father. She excelled in drawing portraits with crayons. The celebrated painter, Eglon Vander Neer, married her.

SPILL, *v. a. & v. n.* } Sax. *ƿillan*; Goth. and
SPILTH, *n. s.* } Teut. *spilla*; Belg. *spijlen*.
To shed; throw away; lose; destroy; waste; be lavish; be shed: *spilth*, that which is spilt.

Thus is our thought with pain of thistle tilled,
Thus be our noblest parts dried up with sorrow;
Thus is our mind with too much minding *spilled*.

Thy father bids thee spare, and chides for *spilling*.
Sidney.
Id.

Why are you so fierce and cruel?
Is it because your eyes have power to kill?
Then know that mercy is the Mighty's jewel,
And greater glory think to save than *spill*.
Id.

Friend or brother,
He forfeits his own blood that *spills* another.
Shakspeare. Timon.
Our vaults have wept with drunken *spilth* of wine.
Shakspeare.

All bodies are with other bodies filled;
But she receives both heaven and earth together:
Nor are their forms by rash encounters *spilled*;
For there they gather, and neither toucheth either.
Davies.

Be not angry with these fires;
For then their threats will kill me:
Nor look too kind on my desires;
For then my hopes will *spill* me.
Ben Jonson.

Themselves exact their cruelty,
And I constrained am this blood to *spill*.

They having *spilled* much blood, and done much
waste,
Subduing nations; and achieved thereby
Fame in the world, high titles, and rich prey;
Shall change their course to pleasure, ease, and
sloth.
Milton.

Medea must not draw her murth'ring knife,
And *spill* her children's blood upon the stage.
Roscommon.

Orbellan did disgrace
With treach'rous deeds our mighty mother's race;
And to revenge his blood, so justly *spilt*,
What is it less than to partake his guilt?
Dryden.

Nor the Centaur's tale
Be here repeated; how, with lust and wine
Inflamed, they fought and *spilt* their drunken souls
At feasting hour.
Philips.

This sight shall damp the raging ruffian's breast,
The poison *spill*, and half-drawn sword arrest.

Tickell.
He was so topful of himself, that he let it *spill* on
all the company: he spoke well indeed, but he spoke
too long.
Watts.

SPILL, *n. s.* Teut. *spille*; Belg. *spil*. A shiver
or small bar of wood or iron; small quantity of
money.

The oysters, besides gathering by hand, have a
peculiar dredge, which is a thick strong net, fastened
to three *spills* of iron, and drawn at the boat's stern.
Carew.

Have near the bunghole a little venthole, stopped
with a *spill*.
Mortimer.

The bishops, who consecrated this ground, were
wont to have a *spill* or sportule from the credulous
laity.
Ayliffe.

SPILLER (John), a young sculptor of great
promise, was born December, 1763, in London,
and after a liberal education became a pupil of
Bacon. His talents becoming known, he was
chosen to execute a statue of Charles II. for the
centre of the Royal Exchange; and while en-
gaged in this work the pulmonary disease, to
which he had a tendency, became so much ag-
gravated that soon after his much-admired pro-
duction was placed on its pedestal he expired, in
May 1794. The author of the *Curiosities of*
Literature makes the following observations illus-
trative of the enthusiasm of genius:—'The young
and classical sculptor who raised the statue of
Charles II., placed in the centre of the Royal
Exchange, was, in the midst of his work, advised
by his medical friends to desist from working in
marble; for the energy of his labor, with the
strong excitement of his feelings, already had
made fatal inroads on his constitution. But he
was willing, he said, to die at the foot of his statue.
The statue was raised, and the young
sculptor, with the shining eyes and hectic blush of
consumption, beheld it there, returned home and
shortly was no more.' He married in 1792, and
his accomplished wife died a few months after
him of a similar disease. They left behind them,
at the tender age of a few months, an only
daughter.

SPILSBY, a market-town in the county of
Lincoln, situated on an eminence overlooking the
extensive level of the marshes and the German
Ocean. It is the chief town in the southern
part of Lindsey division, and consists mainly of
four streets, uniting at the market-place. A spa-
cious square, with the market cross at the east
end, and the town-hall at the west. The cross
consists of a plain octagonal shaft, with a quadran-
gular base, elevated on five steps. The town-
hall is a plain brick building, built in 1764,
standing on arches on the site of an old hall.
The general quarter sessions of the peace have
been holden here for upwards of 100 years. The
parish church, situated in the west end of the
town, is an irregular building, consisting of north
and south aisles, the latter being much larger
than the rest of the building; and here is a chapel,
in which are some ancient monuments belonging
to the families of Beke, Willoughby, and Bertie.
At the west end of the church is an embattled
tower of more modern date. Spilsby contains a
free-school and Sunday school. Market on Mon-

day, and three annual fairs. Thirty-one miles east of Lincoln, and 134 north of London.

SPIN, *v. a. & v. n.* } *Præter. spun or*
 SPIN'DLE, *n. s. & v. n.* } *span; part. spun.*
 SPIN'DLESHANKED, *adj.* } *Sax. spinnan; Belg.*
 SPIN'NY, } *spinnen. To draw*
 SPIN'STER, *n. s.* } *out into, or form,*
 threads: hence to protract; draw out; form by degrees; to exercise the art of spinning; stream out in threads or filaments: a spindle is a pin on which the spinning of thread is performed: spindleshanked, having thin or spindle-like legs: spinster, a woman who spins; the legal term for an unmarried woman not of noble birth: spinny is their loom.

The women *spun* goats' hair. *Exodus xxxv. 26.*
 Weaving spiders come not here:
 Hence, you long-legged *spinners*, hence!

Shakspeare.

The *spinsters* and the knitters in the sun,
 And the free maids that weave their thread with bones,

Do use to chaunt it. *Id. Twelfth Night.*

You would be another Penelope; yet all the yarn she *spun*, in Ulysses's absence, did but fill Ithaca full of moths.

Shakspeare.

Bodies fibrous by moisture incorporate with other thread, especially if there be a little wreathing; as appeareth by the twisting of thread, and twirling about of *spindles*.

Bacon.

Another ill accident in drought is the *spindling* of the corn, which with us is rare, but in hotter countries common; insomuch as the word calamity was first derived from calamus, when the corn could not get out of the stalk.

Id.

Together furiously they ran,
 That to the ground came horse and man;
 The blood out of their helmets *span*,
 So sharp were their encounters.

Drayton's Nymphiad.

If a gentlewoman be termed *spinster*, she may abate the writ.

Lord Coke.

I passed lightly over many particulars, on which learned and witty men might *spin* out large volumes.

Digby.

Whether the sun, predominant in heaven,
 Rise on the earth, or earth rise on the sun;
 He from the east his flaming road begin,
 Or she from west her silent course advance
 With inoffensive pace, that *spinning* sleeps
 On her soft axle, while she paces even
 And bears thee soft with the smooth air along,
 Solicit not thy thoughts.

Milton's Paradise Lost.

Sing to those that hold the vital sheers,
 And turn the adamantin *spindle* round
 On which the fate of gods and men is wound.

Milton.

A practised *spinner* shall *spin* a pound of wool worth two shillings for sixpence.

Graunt.

We can fling our legs and arms upwards and downwards, backwards, forwards, and round, as they that *spin*.

More.

The fates but only *spin* the coarser clue;
 The finest of the wool is left for you.

Dryden.

Repose yourself, if those *spindle* legs of yours will carry you to the next chair.

Id. Spanish Fryar.

By one delay after another, they *spin* out their whole lives, till there's no more future left before 'em.

L'Estrange.

Men of large thoughts and quick apprehensions are not to expect any thing here, but what, being *spun* out of my own coarse thoughts, is fitted to men of my own size.

Locke.

So Pallas from the dusty field withdrew,
 And, when imperial Jove appeared in view,
 Resumed her female arts, the *spindle* and the clew,
 Forgot the sceptre she so well had swayed,
 And, with that mildness she had ruled, obeyed.

Stepnev.

The *spindles* must be tied up, and, as they grow in height, rods set by them, lest by their bending they should break.

Mortimer.

When the flowers begin to *spindle*, all but one or two of the biggest at each root, should be nipped off.

Id.

They plow it early in the year, and then there will come some *spinny* grass that will keep it from scalding.

Id.

The marriage of one of our heiresses with an eminent courtier gave us *spindle* shanks and cramps.

Tatler.

Upon a true repentance, God is not so fatally tied to the *spindle* of absolute reprobation, as not to keep his promise, and seal merciful pardons.

Jasper Maine.

Why should Rome fall a moment ere her time?
 No, let us draw her term of freedom out
 In its full length, and *spin* it to the last.

Addison's Cato.

Her lawyer is a little rivelled, *spindleshanked* gentleman.

Addison.

Ten thousand stalks their various blossoms spread;
 Peaceful and lowly in their native soil,
 They neither know to *spin*, nor care to toil.

Prior.

If his cure lies among the lawyers, let nothing be said against intangling property, *spinning* out causes, and squeezing clients.

Collier.

My *spinning* wheel and rake
 Let Susan keep for her dear sister's sake.

Gay.

The lines are weak, another's pleased to say;
 Lord, Fanny *spins* a thousand such a day.

Pope.

I desire that a yearly annuity of twenty pounds shall be paid to Rebecca Dingley, of the city of Dublin, *spinster*, during her life.

Swift.

Do thou take me for a Roman matron,
 Bred tamely to the *spindle* and the loom?

A. Philips.

That hour arrived, his work begins;
 He *spins* and weaves, and weaves and *spins*;
 Till circle upon circle wound
 Careless around him and around,
 Conceals him with a veil, though slight,
 Impervious to the keenest sight.

Cowper.

SPINA BIFIDA. See SURGERY.

SPINA CERVINA, the same as the rhamnus catharticus. See RHAMNUS.

SPINA VENTOSA, in surgery, that species of corruption of the bones which takes its rise in the internal parts, and by degrees enlarges the bone, and raises it into a tumor. See SURGERY.

SPIN'ACH, *n. s.* } Latin *spinachia*. A
 SPIN'AGE. } plant.

It hath an apetalous flower, consisting of many stamina included in the flower-cup, which are produced in spikes upon the male plants, which are barren; but the embryos are produced from the wings of the leaves on the female plants, which afterwards become roundish or angular seeds, which in some sorts have thorns adhering to them.

Miller.

Spinage is an excellent herb crude or boiled.

Mortimer.

SPINACIA, spinage, in botany, a genus of plants belonging to the class of diœcia, and to the order of pentandria; and in the natural system arranged under the twelfth order, holoraceæ.

The male calyx is quinquepartite; there is no corolla: the female calyx is quadrifid: no corolla; there are four styles, and one seed within the indurated calyx. There are only two species: 1. *S. fera*, wild spinage, produces its fruit on footstalks. 2. *S. oleracea*, common spinage, has sessile fruits and sagitated leaves. It has been cultivated in Britain since 1568, but it is not known from what country it was originally brought. When intended for winter use, it should be sown on an open spot of ground in the end of July; and if possible when the weather is rainy. When the young plants are come up, the weeds must be destroyed, and the plants left at about five inches asunder. The ground being kept clear of weeds, the spinage will be fit for use in October. The way of gathering it to advantage is only to take off the longest leaves, leaving those in the centre to grow bigger; and at this rate a bed of spinage will furnish the table for a whole winter, till the spinage sown in spring is become fit for use, which is commonly in April.

SPINE, in botany, thorns, rigid prickles: a species of arma, growing on various parts of certain plants for their defence; spinæ ramorum arcent pecora. On the branches we find examples in the pyrus, prunus, citrus, hippophaes, gmelina, rhamnus, lycium, &c.; on the leaves in the aloe, agave, yucca, ilex, hippomane, theophrasta, carlina, &c.; on the calyx, in the carduus, enicus, centauria, molucella, galeopsis, &c.; on the fruit, in the trapa, tribulus, murex, spinacia, agremonia, datura, &c.

SPINAGE. See **SPINACH** and **SPINACIA**.

SPINAL, *adj.* } Lat. *spina*. Belonging to
SPINE, *n. s.* } the backbone: the backbone.

All *spinal*, or such as have no ribs, but only a backbone, are somewhat analogous thereto.

Broune's Vulgar Errors.

There are who think the marrow of a man,
Which in the *spine*, while he was living ran;
When dead, the pith corrupted will become
A snake, and hiss within the hollow tomb. *Dryden.*
Descending careless from his couch, the fall
Luxed his joint neck, and *spinal* marrow bruised.

Philips.

Those solids are entirely nervous, and proceed from the brain and *spinal* marrow, which, by their bulk, appear sufficient to furnish all the stamina or threads of the solid parts.

Arbuthnot.

The rapier entered his right side, reaching within a finger's breadth of the *spine*. *Wiseman's Surgery.*

SPINAL MARROW, **SPINAL NERVES**. See **ANATOMY**, **Index**.

SPINALIS, in anatomy, several muscles, &c. of the spine. See **ANATOMY**.

SPINCKES (Nathanael), an eminent non-jurant divine, born in 1654, at Castor n Northamptonshire, where his father Edmund, a native of New England, and a man of letters, was rector. He was educated at Trinity College, Cambridge, in 1669-70. In 1671 he fell heir, by his father's death, to a large fortune and a fine library. After taking his degrees of B. and M. A., &c., he was admitted priest, December 22d, 1678. He then became chaplain to Sir R. Edgecomb; and in 1681 the same to the duke of Lauderdale. In 1685 he was made rector of Peakirk in Nor-

thamptonshire, where he married Miss Rutland of London. In 1687 he was made a prebendary of Salisbury, rector of St. Mary, and preacher at Stratford at £80 a year. But in 1690 he lost all his preferments, by refusing to take the oaths to William and Mary. On the 3d of June 1713 he was made a bishop. He died 28th of July, 1727. His publications were numerous. The most celebrated is his *Sick Man Visited*.

SPINDLE, in geometry, a solid body generated by the revolution of some curve line about its base or double ordinate; in opposition to a conoid, which is generated by the rotation of the curve about its axis or absciss, perpendicular to its ordinate. The spindle is denominated circular, elliptic, hyperbolic, or parabolic, &c., according to the figure of its generating curve.

SPINDLE, in mechanics, sometimes denotes the axis of a wheel, or roller, &c., and its ends are the pivots.

SPINE. See **ANATOMY**, **Index**.

SPINE, in botany. See **SPINÆ**.

SPINEL, in mineralogy, a sub-species of octohedral corundum. Color red. Occurs in grains, more frequently crystallised; in a perfect octohedron, which is the fundamental figure; in a tetrahedron, perfect or modified; a thick equiangular six-sided table; a very oblique four-sided table; a rhomboidal dodecahedron; a rectangular four-sided prism. Splendent and vitreous. Cleavage fourfold. Fracture flat conchoidal. Transparent to translucent. Refracts single. Scratches topaz, but is scratched by sapphire. Brittle. Specific gravity 3.5 to 3.8. Fusible with borax. Its constituents are, alumina 82.47, magnesia 8.78, chromic acid 6.18, loss 2.57.—Vauquelin. It is found in the gneiss district of Acker in Sudermannland, in a primitive limestone; in the kingdom of Pegu; and in Ceylon. It is used as a precious stone. When it weighs four carats (about sixteen grains) it is considered of equal value with a diamond of half the weight.—Jameson.

SPINEL, in the linen manufactory, four hanks.

SPINELLANE. Color plum-blue. It occurs crystallised in rhomboids of 117° 23', and 62° 37'; and in six-sided prisms acuminated with three planes. It scratches glass. It is found on the shores of the lake of Laach, in a rock composed of glassy felspar, quartz, hornblende, &c. It is said to be a variety of Haüyne.

SPINELLO (Aretino), a Tuscan painter, of great repute in his time. He was born in 1328, and studied under James di Casentino, whom at twenty he excelled. He painted history and portraits admirably, and finished the pieces exquisitely at last. But he painted a picture of the fallen angels, in which he drew so horrid a picture of Lucifer that it frightened him so much as to affect his senses ever after. He died in 1420.

SPINELLO (Paris), the son and disciple of Aretino, was also an eminent painter. His style greatly resembled that of his father, whom he did not long survive, dying in 1422.

SPINESCUTE, sharp and pricking.

SPINET, *n. s.* Fr. *espinette*. A small harp-sichord; an instrument with keys.

When miss delights in her *spinnet*,
A fiddler may his fortune get.

Swift.

SPINET, or **SPINNET**, a musical instrument ranked in the second or third place among harmonious instruments. It consists of a chest or belly made of the most porous and resinous wood to be found, and a table of fir glued on slips of wood called summers, which bear on the sides. On the table is raised two little prominences or bridges, wherein are placed so many pins as there are chords or strings to the instrument. It is played on by two ranges of continued keys, the former range being the order of the diatonic scale, and that behind the order of the artificial notes or semitones. The keys are so many flat pieces of wood, which, touched and pressed down at the end, make the other raise a jack which strike and sound the strings by means of the end of a crow's quill, wherewith it is armed. The first thirty strings are of brass, the other more delicate ones of steel or iron wire; they are all stretched over the two bridges already mentioned. The figure of the spinet is a long square or parallelogram: some call it a harp couched, and the harp an inverted spinet. See **HARP**. This instrument is generally tuned by the ear; which method of the practical musicians is founded on a supposition that the ear is a perfect judge of an octave and a fifth. The general rule is to begin at a certain note, as C, taken towards the middle of the instrument, and turning all the octaves up and down, and also the fifths, reckoning seven semitones to each fifth, by which means the whole is tuned. Sometimes to the common or fundamental play of the spinet is added another similar one in unison, and a third in octave to the first, to make the harmony the fuller; they are either played separately or together by means of a stop; these are called double or triple spinets; sometimes a play of violins is added, by means of a bow, or a few wheels parallel to the keys, which press the strings and make the sound last as long as the musician pleases, and heighten and soften them more or less, as they are more or less pressed. The harpsichord is a kind of spinet, only with another disposition of the keys. See **HARPSICHORD**. The instrument takes its name from the small quill ends which touch the strings, resembling spinæ or thorns.

SPINIFEX, in botany, a genus of plants belonging to the class of polygamia and order of monœcia. The hermaphrodite flowers have a calyx with bivalved biflorous glumes, the valvets being parallel to the rachis; the corolla is bivalved and awnless; there are three stamina and two styles. In the male flowers the calyx is common with the hermaphrodite; the corolla and stamina are similar. There is only one species; viz. *S. squarrosus*.

SPINK, *n. s.* Scot. *spink*. A finch; a bird.

Want sharpens poesy, and grief adorns;
The *spink* chaunts sweetest in a hedge of thorns.

Harte.

SPINNING (from spin), in commerce, the act or art of reducing silk, flax, hemp, wool, hair, or other matters, into thread. Spinning is either performed on the wheel, or with a distaff and spindle, or with other machines proper for the several kinds of working. Hemp, flax, nettle-

thread, and other like vegetable matters, are to be wetted in spinning; silks, wools, &c., are spun dry, and do not need water; yet there is a way of spinning or reeling silk as it comes off the cases or balls where hot and even boiling water is to be used. See **SILK**. The vast variety and the importance of those branches of our manufactures which are produced from cotton, wool, and flax, spun into yarn, together with the cheapness of provisions and the low price of labor in foreign countries, which are our rivals in trade, have occasioned many attempts at home to render spinning more easy, cheap, and expeditious. For which see **COTTON**. These contrivances have in some parts of Scotland been applied to the spinning of flax.

The ancient Greeks entertained so high an opinion of the utility and benefits of spinning and making cloth, that they ascribed the invention to Minerva, the goddess of wisdom. But we, who profess to be Christians, ought to trace the origin of the arts to persons who really existed, and not to the imaginary gods and goddesses of the Greeks. Moses, while he informs us that music and metallurgy were invented by the descendants of Cain before the flood, mentions also that Jabel was the father or instructor of such as dwell in tents. Hence it is evident that spinning, weaving, and cloth-making, must have been invented about or before the same period, and probably by the same person. But to descend to our own times we do not know, except perhaps the steam-engine, any mechanical invention that has made such amazing addition to the activity, industry, and opulence of this island, as the invention of Sir Richard Arkwright for spinning by water, where dead matter is made to perform all that the nicest fingers can do when directed by the never ceasing attention of the intelligent eye. We know not to what benefactor we owe the fly-wheel. Sir Richard has the honor of combining this with the spindle and distaff. To give an intelligible and accurate description of a cotton mill would require a volume. But in our article **COTTON** will be found a complete account of the modern furniture of this most important manufactory.

Worsted is spun in a frame resembling the water-frame of Arkwright, from which it only differs in the relative distances of the rollers, by which the drawing out or extending of the fibres is effected.

In 1806 Messrs. Clarke and Bugby obtained a patent for improvements in a machine for spinning hemp and flax, which is intended to be worked by hand labor, and to be at such a small expense as to bring it within the reach of small manufacturers. The inventors state it to be constructed upon such safe and easy principles, that no length of experience is necessary to enable children to work it; and that it occupies so little space that the machines may be placed in small rooms, out-buildings, or other cheap places. To effect the above purposes it was necessary to get rid of the flyer fixed upon the spindle used in the old machinery for spinning hemp or flax, which additions require a power in proportion of five to one; and also to surmount the difficulty which arises from the want of elasticity in these

substances, and which prevents them from being spun by stretching out at the same time that the thread is twisted, in the manner of the mule or jenny. These patentees recommend a machine which is in fact a mule with certain modifications; and, to give the effect of elasticity in the fibres, they have two methods. The most simple, and that which they particularly recommend, is to provide a holder of large wire for every spindle, which holders are several inches in length, fixed in an arbor or shaft that extends from one end of the carriage to the other.

This arbor or shaft, with the holders, may be considered as an enlarged and improved substitute for what is called the faller in the mules or jennies for spinning cotton, and the wire-holders fixed therein have elliptical eyes at their extremities, through each of which a thread is conducted in its passage from the rollers which draw out the thread to its spindle. The wire of which the holder is made, after forming the elliptical eye, is left or extended beyond the uppermost part something in the manner of a corkscrew, so that the yarn may be conveniently slipped in when occasion may require it. These holders for each thread are for the purpose of keeping the yarn in a state nearly vertical over the tops of the spindle, when the carriage which contains them is coming out; and, as they will readily yield or spring from the vertical position, they have the same effect as elasticity in the fibres of the substance which is to be stretched out; but the wires being removed from the vertical situation at the beginning of the return of the carriage and thrown into nearly an horizontal position, by inclining the shaft into which they are all fixed, they bring the yarn below the tops of the bobbins or quills which are fixed upon the spindles, which will then wind up the threads upon them when the spindles are turned round, and then the wire-eyes being regularly curved, and raised up again by the motion of an elliptic wheel which is turned round by the machine, they distribute the yarn regularly upon the bobbins or quills, and prevent it from linking and improperly doubling or twisting together. Another method of compensating for the want of elasticity in hemp and flax is to fix a round bar of wood, about an inch and a half in diameter, the whole length of the carriage, about three or four inches above the tops of the spindles, so that the outer surface, or that next the person who works the machine, may be perpendicular, or nearly so, over the tops of the spindles, the inner side having pieces of wood or metal fixed or nailed thereto, leaving only small spaces or notches between each for the yarn to pass through. The use of these pieces is to prevent the threads from getting together and entangling. Every thing relating to the wire holders before mentioned, and the arbor to which they are affixed, must be applied in concert with these pieces of metal, which form a separation between the threads. See COTTON AND WEAVING.

M. Reaumur has shown, by a series of curious experiments, that the common mussel, and some other shell-fish of the sea, possess the art of spinning in a great degree of perfection. But he observes that, though the workmanship is the

same, the manner of producing it is very different. Spiders, caterpillars, and the like, make threads of any length that they please by making the viscous liquor, of which they are formed, pass through a fine perforation in the organ appointed for this spinning: but the way in which the mussels form their threads is very different, as the former resembles the work of the wire-drawer, so does this that of the founder, who casts metals in a mould. The canal of the organ destined for the mussel's spinning, which, from its shape, is commonly called its tongue, is the mould in which its thread is cast, and gives it its determinate length.—Mem. Acad. Par. 1711.

The SPINNING-WHEEL, in rope-making, for twelve spinners, is about five feet in diameter, and is hung between two posts fixed in the ground: on its top is fixed a semi-circular frame called the head, which contains twelve whirls that turn on iron spindles, with hooks to their front ends to hang the hemp on, and are worked by means of a leather band encircling the wheel and whirls. The whirls are made to run with a truer motion when the head on the rising side of the band has a larger segment of a circle than the falling side; or, in other words, let the base part of the head be longer from the middle than the opposite or falling side, by which means the band will be kept equally tight over the whirls, and consequently the motion be alike to all. N. B. Heads made in this manner have always the wheel turned the same way.

SPINOSITY, *n. s.* Lat. *spinusos*. Crabbedness; thorny or briary perplexity.

The first attempts are always imperfect; much more in so difficult and *spiny* an affair as so nice a subject.

Philosophy consisted of nought but dry *spinosityes*, lean notions and endless altercations about things of nothing.

Glanville.

SPINOSUM FOLIUM, a spinous leaf, indicates the margin running out into rigid points or prickles, quod margine exit in acumina duriora, rigida, pungentia.

SPINOSUS CAULIS. See BOTANY, Glossary.

SPINOUS, in botany. See SPINOSUS.

SPINOUS FISHES, such as have some of the rays of the back fin running out into thorns or prickles, as the perch, &c.

SPINOZA (Benedict), was born at Amsterdam the 24th of November 1632. His father was a Jew of Portugal, by profession a merchant. After being taught Latin, by a physician, he studied theology, and afterwards devoted himself to philosophy. He began very early to be dissatisfied with the Jewish religion; and, as his temper was open, he did not conceal his doubts from the synagogue. The Jews, it is said, offered to tolerate his infidelity, and even promised him a pension of 1000 dollars a year, if he would remain in their society, and continue outwardly to practise their ceremonies. But, if this offer was really made, he rejected it, from his aversion to hypocrisy, or because he could not endure the restraint which it would have imposed. He also refused the legacy of a very considerable fortune, to the prejudice of the natural heirs; and he learned the art of polishing glass for spectacles, that he might subsist independently of every one. An

accident hastened his leaving the synagogue. As he was returning home one evening from the theatre, he was stabbed by a Jew; the wound was slight; but the attempt led Spinoza to conclude that the Jews had formed the design of assassinating him. He then became a Christian, and frequented the churches of the Lutherans and Calvinists. He now devoted himself more than ever to his philosophical speculations; and, being often interrupted by his friends, he left Amsterdam, and settled at the Hague, where he sometimes continued for months together without ever stirring from his lodging. His *Tractatus Theologico Politicus* was published about this time, a book containing all those doctrines in embryo, which were afterwards unfolded in his *Opera Posthuma*, and which are generally considered as a system of atheism. His fame, which had now spread far and wide, obliged him sometimes to interrupt his philosophical reveries. Learned men visited him from all quarters. While the prince of Condé commanded the French army, in Utrecht, he entreated Spinoza to visit him; and, though he was absent when the philosopher arrived, he returned immediately, and spent a considerable time with him. The elector Palatine offered to make Spinoza professor of philosophy at Heidelberg; but this he declined. He died of a consumption at the Hague on the 21st of February 1677, aged forty-five. His life was a perpetual contradiction to his opinions. He was temperate, liberal, and remarkably disinterested; he was sociable, affable, and friendly. His conversation was agreeable and instructive, and never deviated from the strictest propriety. In the *Tractatus Theologico Politicus*, he treats of prophecy and prophets; and of the call of the Hebrews, whom he affirms to have been distinguished from other nations only by the admirable form of their government. He is likewise of opinion, or pretends to be so, that God may, in a supernatural way, have given political institutes to other nations as well as to the Hebrews. For, according to him, every nation was blessed with the light of prophecy. That light indeed, if his notions of it be just, was of very little value. He labors to prove that the prophets were distinguished from other men only by their piety and virtue; and that their writings are valuable to us only for the excellent rules they contain respecting piety and virtue. He then endeavours to prove that no miracle, in the proper sense of the word, can have been at any time performed; because every thing happens by a necessity of nature, the result of the divine decrees, which are from all eternity necessary themselves. He acknowledges that in the Scriptures, which he professes to admit as true history, miracles are often mentioned; but he says that they were only singular events which the sacred historians imagined to be miraculous. He affirms, in contradiction to the clearest internal evidence, that the Pentateuch and all the other historical books must have been written by one man; and that man, he thinks, was Ezra. The grounds of this opinion are unworthy of the talents of Spinoza. His principal objection to the authenticity of the Pentateuch is, that Moses is made to speak of himself in the third

person; the very same childish objection since repeated by Thomas Paine, whose ignorance may somewhat excuse him, but Spinoza surely could read the Commentaries of Cæsar, in the original, who speaks of himself modestly in the third person throughout all his writings. He also objects to the expression of the Canaanites being then in the land. These senseless cavils, worthy only of one of those modern freethinkers whose learning, in the opinion of bishop Warburton, is not sufficient to carry them even to the confines of rational doubt, we have sufficiently obviated in another place. See *SCRIPTURE*. In the midst of this dogmatical scepticism, he bears such a testimony to the last chapters of the book of Daniel as we should not have looked for in the writings either of a Jew or a Deist. After detailing the various hypotheses respecting the author and the intention of the book of Job, in which, he says, *Momus* is called Satan, he proceeds in these words:—‘*Transeo ad Danielis librum; hic sine dubio ex cap. 8. ipsius Danielis scripta continet. Undenam autem priora septem capita descripta fuerint, nescio*,’ thus admitting the famous prophecy of the seventy weeks. That so paradoxical a writer, who had been originally a Jew, and was now almost a Deist, should have treated the New Testament with as little ceremony as the Old, will not surprise the intelligent reader. He begins his remarks, however, with affirming that no man can peruse the Christian Scriptures and not acknowledge the apostles to have been prophets; but he thinks that their mode of prophesying was altogether different from that which prevailed under the Mosaic dispensation; and that the gift, whatever it was, forsook them the instant that they left off preaching, as their writings have to him every appearance of human compositions. This distinction between Christian and Jewish prophecy is the more wonderful, that he finds it principally on the dissimilarity of style visible in the writings of the Old and New Testaments. Taking our leave of his *Tractatus Theologico Politicus*, we shall now give our readers a short account of his *Opera Posthuma*. These consist of, 1. *Ethica*, more geometrico demonstrata; 2. *Politica*; 3. *De Emendatione Intellectus*; 4. *Epistolæ, et ad eas Responsiones*; 5. *Compendium Grammaticæ Lingvæ Hebrææ*. The *Ethica* are divided into five parts, which treat in order, *de Deo*; *de natura et origine mentis*; *de origine et natura effectuum*; *de servitute humana, seu de affectuum viribus*; *de potentia intellectus, seu de libertate humana*. As the author professes to tread in the footsteps of the geometers, and to deduce all his conclusions by rigid demonstration from a few self-evident truths, he introduces his work, after the manner of Euclid, with a collection of definitions and axioms. These are couched in terms generally ambiguous. His definition of substance, for instance, is so expressed as to admit of two senses; in one of which it is just, whilst in the other it is the parent of the most impious absurdity. ‘*Per substantiam intelligo id, quod in se est, et per se concipitur: hoc est id, cujus conceptus non indiget conceptu alterius rei, a quo formari debeat.*’ It by this he meant that a substance

is that which we can conceive by itself without attending to any thing else, or thinking of its formation, the definition, we believe, will be admitted by every reflecting mind, as sufficiently distinguishing the thing defined from an attribute, which, he says, is that which we perceive of a substance, and which we certainly cannot conceive as existing by itself. Thus the writer of this article can shut his eyes and contemplate in idea the small quarto volume now before him, without attending to any thing else, or thinking of its paradoxical author, or even of the Great Being who created the matter both of him and of it; but he cannot for an instant contemplate the yellow color of its vellum boards without thinking of triple extension, or, in other words, of body. The book therefore is a substance, because conceivable by itself; the color is an attribute or quality, because it cannot be conceived by itself, but necessarily leads to the conception of something else. But if Spinoza's meaning be, that nothing is a substance but what is conceived as existing from eternity, independent of every thing as a cause, his definition cannot be admitted: for every man conceives that which in himself thinks, and wills, and is conscious, as a substance; at the same time that he has the best evidence possible that he existed not as a conscious thinking, and active being, from eternity. His fourth axiom is thus expressed:—'Effectus cognitio a cognitione causæ dependet, et eandem involvit,' and his fifth, 'Quæ nihil commune cum se invicem habent, etiam per se invicem intelligi non possunt, sive conceptus, unius alterius conceptum non involvit.' The former of these propositions, so far from being self-evident, is not even true; and the latter is capable of two senses very different from each other. That every effect proceeds from a cause is indeed an axiom; but surely we may know the effect accurately, though we be ignorant of the particular cause from which it proceeds (see PHILOSOPHY and PHYSICS); nor does the knowledge of the one by any means involve the knowledge of the other. If different things have nothing in common, it is indeed true that the knowledge of one of them will not give us an adequate conception of the other; but it will in many cases compel us to believe that the other exists or has existed. A parcel of gunpowder lying at rest has nothing in common with the velocity of a cannon-ball; yet, when we know that a ball has been driven with velocity from a cannon, we infer with certainty that there has been a parcel of powder at rest in the chamber of that cannon, before it was fired. It is upon such ambiguous definitions and axioms as these that Spinoza has raised his pretended demonstrations, that one substance cannot produce another; that every substance must necessarily be infinite; that no substance exists or can be conceived besides God; and that extended substance or body is one of the infinite attributes of God. We shall not waste time with a formal confutation of these absurdities. They are sufficiently confuted in other articles of this work; and whoever wishes for a more particular examination of the author's principles, may find it in Dr. Clarke's Demonstration of the Being and

Attributes of God. According to Spinoza bodies are either attributes or affections of God; and, as he says there is but one extended substance, he affirms that substance to be indivisible. He attempts to prove that God is an extended as well as a thinking substance; that as a thinking substance he is the cause of the idea of a circle, and as an extended substance of the circle itself; that the minds of men are not substances, but certain modifications of the divine attributes. And that thinking and extended substances are in reality but one and the same substance, which is sometimes comprehended under one attribute of the Deity, and sometimes under another. If this impious jargon be not Atheism, or as it has been sometimes called Pantheism, we know not what it is. According to Spinoza, there is but one substance, which is extended, infinite, and indivisible. That substance indeed he calls God; but he labors to prove that it is corporeal; that there is no difference between mind and matter; that both are attributes of the Deity variously considered; that the human soul is a part of the intellect of God; that the same soul is nothing but the idea of the human body; that this idea of the body, and the body itself, are one and the same thing; that God could not exist, or be conceived, were the visible universe annihilated; and therefore that the visible universe is either the one substance, or at least an essential attribute or modification of that substance. According to him, nothing but the prejudices of education could have led men to fancy that there is any real distinction between good and evil, merit and demerit, praise and reproach, order and confusion; that eyes were given that the owners might see; that the sun was formed to give light, &c. If this be true, it is impossible to discover wisdom in the operations of his one substance; since it is the very characteristic of folly to act without any end in view. His Compendium Grammaticæ Linguæ Hebrææ, though left imperfect, appears to have so much merit, that it is to be wished he had fulfilled his intention of writing a philosophical grammar of that language, instead of wasting his time on abstruse speculations, which, though they seem not to have been injurious to his own virtue, are certainly not calculated to promote the virtue of others, or to increase the sum of human happiness.

SPINOZISM, the opinions and doctrines of Spinoza. See the last article.

SPINTHERE. Color greenish-gray. In small oblique double four-sided pyramids. It does not scratch glass. It occurs in the department of Iseré in France, incrusting calcareous spar crystals. It is believed to be a variety of sphene.

SPINTURNIX, in fabulous history, a bird, or rather a quadruped with wings, which was said sometimes to attend the sacrifices, and carry away a live coal from the altar; which was reckoned an omen of ill luck.—Pliny. It would have been more natural for such a monster to have carried off the sacrifice.

SPIRA (Francis), an eminent Italian lawyer, who flourished with great reputation in the beginning of the sixteenth century, at Citadella in the Venetian States. He had imbibed the prin-

cles of the Reformation, and was accused of heresy, before John De La Casa, archbishop of Benevento, the pope's nuncio at Venice. He made some concessions, and asked pardon for his errors; but the nuncio insisted on a public recantation. Spira was exceedingly averse to this measure, but, at the pressing entreaties of his wife and his friends, he at last complied. But he would have suffered much less torture at the stake, had he had the courage to have avowed his faith and died a martyr, than he did afterwards by the remorse he felt, and the dreadful state of melancholy he fell into. By the advice of physicians and divines, he was removed to Padua; but no change of place, medicine, regimen, or consolatory advice, could afford any relief to his wounded conscience. He thought himself certain of eternal damnation, and refused all the consolation that could be suggested. He sometimes even imagined that he already felt the torments of the damned. His melancholy case, in which he long lingered, and to which at last he fell a victim in 1548, made a great noise throughout Europe. The celebrated Henry Scrimzeor is said to have written an account of it with his life. We have seen a small work giving an account of his case in English, probably an extract or translation from Scrimzeor; but, of all the books that ever were printed, it would be the most dangerous to be put into the hands of a person inclined to melancholy.

SPIRACLE, n. s. } Lat. *spiraculum*. A
SPIRACULA. } breathing noie; vent;
 small aperture.

Most of these *spiracles* perpetually send forth fire, more or less. *Woodward.*

As these volcanos are supposed to be *spiracula* or breathing holes to the great subterraneous fires, it is probable that the escape of elastic vapours from them is the cause, that the earthquakes of modern days are of such small extent compared to those of ancient times, of which vestiges remain in every part of the world, and on this account may be said not only to be innocuous, but useful. *Darwin.*

SPIRÆA, the spiræa frutex, in botany, a genus of plants belonging to the class of icosandria, and to the order of pentagynia; natural order twenty-sixth, pomacææ: CAL. quinquefid; there are five petals; CAPS. polyspermous. There are eighteen species; of which two only are British, the filipendula and ulmaria. 1. *S. filipendula*, dropwort, has pinnated leaves: the leaflets are serrated; the stalk is herbaceous, about a foot and a half high, terminated with a loose umbel of white flowers, often tinged with red. The petals are generally six, and the segments of the calyx are reflexed; the stamina are thirty or more; the germina twelve or upwards. It grows in mountainous pastures. 2. *S. ulmaria*, meadow-sweet. The leaves have only two or three pair of pinnæ, with a few smaller ones intermixed; the extreme one being larger than the rest, and divided into three lobes. The calyx is reddish; the petals white, and the number of capsules from six to ten twisted in a spiral. The tuberous pea, like roots of the filipendula dried and reduced to a powder, have been used instead of bread in times of scarcity. Hogs are very fond of these roots. Cows, goats, sheep, and

swine, eat the plant; but horses refuse it. The flowers of the ulmaria have a fragrant scent, which rises in distillation. The whole plant indeed is extremely fragrant, so that the common people of Sweden strew their floors with it on holidays. It has also an astringent quality, and has been found useful in dysenteries, ruptures, and in tanning of leather.

SPIRAGO, a town of the new Italian kingdom, in the department of the Olona, district and late principality of Pavia, seated on the Olona, in a fertile country.

SPIRAL, adj. } Fr. *spirale*; Lat. *spira*.
SPIRALLY, adv. } Curve; winding; in-
SPIRE, n. s. & v. n. } volved, like a screw: the
 adverb corresponding: a spire is a curvature; any thing wreathed or hoisted to a point; any thing taper: to shoot up in the way.

'Twere no less than a traducement to silence, that
 Which to the *spire* and top of praises vouched,
 Would seem but modest. *Shakspeare.*

His head
 Crested aloft, and carbuncle his eyes;
 With burnished neck of verdant gold, erect
 Amidst his circling *spires*, that on the grass
 Floated redundant. *Milton.*

With glistering *spires* and pinnacles adorned. *Id.*
 He cannot make one *spire* of grass more or less
 than he hath made. *Hale's Origin of Monkind.*

A dragon's fiery form belied the god,
 Sublime on radiant *spires* he rode. *Dryden.*

The process of the fibres in the ventricles, running in *spiral* lines from the tip to the base of the heart, shews that the systole of the heart is a muscular constriction, as a purse is shut by drawing the strings contrary ways. *Ray.*

The sides are composed of two orders of fibres, running circularly or *spirally* from base to tip.

Id. on the Creation.
 It is not so apt to *spire* up as the other sorts, being more inclined to branch into arms. *Mortimer.*

These pointed *spires* that wound the ambient sky,
 In glorious change! shall in destruction lie. *Prior.*
 Why earth or sun diurnal stages keep,
 In *spiral* tracts why through the zodiac creep. *Blackmore.*

The intestinal tube affects a straight, instead of a *spiral*, cylinder. *Arbuthnot on Aliments.*

Air seems to consist of *spires* contorted into small spheres, through the interstices of which the particles of light may freely pass; it is light, the solid substance of the *spires* being very small in proportion to the spaces they take up. *Cheyne.*

As woodbine weads the plant within her reach,
 Rough elm, or smooth-grained ash, or glossy beech,
 In *spiral* rings ascends the trunk, and lays
 Her golden tassels on the leafy sprays,
 But does a mischief while she lends a grace,
 Straitening its growth by such a strict embrace. *Cowper.*

Well spake the prophet, Let the desert sing,
 Where sprang the thorn, the *spiry* fir shall spring,
 And where unsightly and rank thistles grew,
 Shall grow the myrtle and luxuriant yew. *Id.*

SPIRAL LINE, in geometry, a curve line of the circular kind, which in its progress recedes from its centre.

SPIRE, in architecture, was used by the ancients for the base of a column, and sometimes for the astragal or tore; but among the moderns it denotes a steeple that continually diminishes as it ascends, whether conically or pyramidically.

SPIRE, or **SPEYER**, an ancient town in the west of Germany, situated at the confluence of the Spirebach and the Rhine, fourteen miles south of Mannheim, and sixteen north-east of Landau. It long gave name to a bishopric; and the only interesting building is the old cathedral, now falling into decay. Spire was frequently the seat of the German diet; and it was in one of these assemblies, in 1529, that a protest, entered by the reformers against certain proceedings of the emperor, procured them the name of Protestants. From 1795 to 1814 it belonged to the French; at present it is the capital of the Bavarian province of the Rhine, and has a lyceum established by government. Population about 4000. The bishopric of Spire was not of great extent. It contained 55,000 inhabitants, and yielded a revenue of £30,000 sterling. It was secularised in 1802, and at present belongs partly to Bavaria, partly to Baden. The episcopal residence was Bruchsal.

SPIRIT , <i>n. s. & v. a.</i>	} Fr. <i>esprit</i> . Lat. <i>spiritus</i> ; Breath; air; wind; an immaterial substance or being; intellectual being; the soul; temper or disposition; genius; ardor; courage; an apparition or spectre: to spirit is to animate or actuate as a spirit; encourage; entice: spiritality is by means of the breath: spirited, lively; vivacious: the noun substantive corresponding:
SPIRITALLY , <i>adv.</i>	
SPIRITED , <i>adj.</i>	
SPIRITEDNESS , <i>n. s.</i>	
SPIRITFULNESS ,	
SPIRITLESS , <i>adj.</i>	
SPIRITOUS ,	
SPIRITOUSNESS , <i>n. s.</i>	
SPIRITUAL , <i>adj.</i>	
SPIRITUALITY , <i>n. s.</i>	
SPIRITUALIZE , <i>v. a.</i>	
SPIRITUALLY , <i>adv.</i>	
SPIRITUALTY , <i>n. s.</i>	
SPIRITUOUS , <i>adj.</i>	
SPIRITUOSITY , <i>n. s.</i>	
SPIRITUOUSNESS .	

responding: spiritfulness is sprightliness; liveliness: spiritless, vapid; dejected; low; depressed: spiritous, defecated; refined; advanced near to spirit: spiritousness corresponds: spirital, immaterial, mental, or intellectual; not gross; not temporal: the adverb (spirually) and noun substantive corresponding: the spiritality is used for the clerical body: to spiritualize is to refine; purify from the pollutions of the world: spirituous is having the quality of spirit; lively; gay: both the noun substantives following corresponding.

The *spirit* shall return unto God that gave it.

Bible.

They were terrified, and supposed that they had seen a *spirit*.

Luke xxiv. 37.

More ample *spirit* than hitherto was wont Here needs me, whiles the famous ancestors Of my most dreaded sovereign I recount, By which all earthly princes she doth surmount.

Faerie Queene.

Place man in some publick society, civil or spirital.

Hooker.

Look, who comes here? a grave unto a soul, Holding the' eternal *spirit* against her will In the vile prison of afflicted death.

Shakspeare. King John.

Farewel the big war,

The *spirit* stirring drum, the ear piercing life.

Shakspeare.

You were used

To say extremity was the trier of *spirits*.

That common chances common men could bear. *Id.*

You are too great to be by me gainsaid
Your *spirit* is too true, your fears too certain. *Id.*

The watry kingdom is no bar

To stop the foreign *spirits*, but they come. *Id.*

When I sit and tell

The warlike feats I've done, his *spirits* fly out

Into my story. *Id. Cymbeline.*

A man so faint, so *spiritless*,

So dull, so dead in look, so woe-begone.

Drew Priam's curtain. *Shakspeare. Henry IV*

Nor doth the eye itself,

That most pure *spirit* of sense, behold itself. *Id.*

Thou art reverend

Touching thy *spiritual* function, not thy life. *Id.*

We of the *spiritality*

Will raise your highness such a mighty sum,

As never did the clergy at one time. *Id.*

If this light be not *spiritual*, yet it approacheth nearest unto *spiritality*; and if it have any corporality, then of all other the most subtle and pure.

Raleigh.

All purges have in them a raw *spirit* or wind, which is the principal cause of tension in the stomach.

Bacon.

All bodies have *spirits* and pneumatical parts within them; but the main difference between animate and inanimate are, that the *spirits* of things animate are all continued within themselves, and branched in veins as blood is; and the *spirits* have also certain seats where the principal do reside and whereunto the rest do resort: but the *spirits* in things inanimate are shut in and cut off by the tangible parts, as air in snow.

Id. Natural History.

Perhaps you might see the image, and not the glass; the former appearing like a *spirit* in the air.

Bacon.

Both visibles and audibles in their working emit no corporeal substance into their mediums, but only carry certain *spiritual* species. *Id.*

She is a *spirit*; yet not like air or wind,

Nor like the *spirits* about the heart or brain;

Nor like those *spirits* which alchymists do find,

When they in every thing seek gold in vain:

For she all natures under heaven doth pass.

Being like those *spirits* which God's bright face do see;

Or like himself, whose image once she was,

Though now, alas! she scarce his shadow be.

For of all forms she holds the first degree,

That are to gross material bodies knit;

Yet she herself is bodyless and free,

And though confined is almost infinite. *Davies.*

Italian pieces will appear best in a room where the windows are high, because they are commonly made to a descending light, which of all other doth set off men's faces in their truest *spirit*.

Wotton.

It may appear airy and *spirituous*, and fit for the welcome of cheerful guests. *Id. Architect.*

Romish adversaries, from the rising up of some schismatical *spirits* amongst us, conclude that the main body of our church is schismatical, because some branches of members thereof were such.

White.

As to the future glory in which the body is to partake, that load of earth which now engages to corruption, must be calcined and *spiritalised*, and thus be clothed upon with glory. *Decay of Piety.*

To a mighty work thou goest, O king,

That equal *spirits* and equal powers shall bring.

Daniel.

A cock's crowing is a tone that corresponds to singing, attesting his mirth and *spiritfulness*.

Harvey.

This would take it much out of the care of the soul, to *spiritualize* and replenish it with good works.

Hammond.

I ask but half thy mighty *spirit* for me. *Cowley.*

Oft pitying God did well-formed *spirits* raise,

To free the groaning nation, and to give

Peace first, and then the rules in peace to live. *Id.*

By means of the curious inoculation of the auditory nerves, the organs of the *spirits* should be allayed. *Derham.*

In the same degree that virgins live more *spiritually* than other persons, in the same degree is their virginity a more excellent state.

Taylor's Rule of Holy Living.

These discourses made so deep impression upon the mind and *spirit* of the prince, whose nature was inclined to adventures, that he was transported with the thought of it. *Clarendon.*

He sits

Upon their tongues a various *spirit*, to raise
Quite out their native language. *Milton.*

In *spirit* perhaps he also saw

Rich Mexico, the seat of Montezume. *Id.*

So talked the *spirited* sly snake. *Id. Paradise Lost.*

Of their wonted vigour left them drained,

Exhausted, *spiritless*, afflicted, fallen. *Id.*

More refined, more *spirituous* and pure,

As nearer to him placed, or nearer tending. *Milton.*

Spiritual armour, able to resist

Satan's assaults. *Id.*

More refined, more *spirituous* and pure,

As to him nearer tending. *Id.*

A wild Tartar, when he spies

A man that's handsome, valiant, wise,

If he can kill him, thinks t' inherit

His wit, his beauty, and his *spirit*. *Butler.*

We begin our survey from the lowest dregs of sense, and so ascend to our more *spiritualized* selves. *Glanville.*

In the southern coast of America, the southern point of the needle varieth toward the land, as being disposed and *spirited* that way by the meridional and proper hemisphere. *Browne.*

What the chymists call *spirit*, they apply the name to so many different things that they seem to have no settled notion of the thing. In general, they give the name of *spirit* to any distilled volatile liquor. *Boyle.*

They, notwithstanding the great thinness and *spiritousness* of the liquor, did lift up the upper surface, and for a moment form a thin film like a small hemisphere. *Id.*

Conceive one of each pronounced *spiritually*, the other vocally. *Holder's Elements of Speech.*

That peculiar law of Christianity, which forbids revenge, no man can think grievous, who considers the restless torment of a malicious and revengeful *spirit*. *Tillotson.*

The noblest *spirit* or genius cannot deserve enough of mankind, to pretend to the esteem of heroic virtue. *Temple.*

He will be faint in any execution of such a counsel, unless *spirited* by the unanimous decrees of a general diet. *Id.*

Such *spirits* as he desired to please, such would I chuse for my judges. *Dryden.*

To sing thy praise, would heaven my breath prolong,

Infusing *spirits* worthy such a song,

Not Thracian Orpheus should transcend my lays. *Id.*

Nor did all Rome, grown *spiritless*, supply
A man that for bold truth durst bravely die. *Id.*

These servants, who have believing masters, are forbid to withdraw any thing of their worldly respect, as presuming upon their *spiritual* kindred; or to honour them less, because they are become their brethren in being believers. *Kettleworth.*

Spirit is a substance wherein thinking, knowing doubting, and a power of moving, do subsist. *Locke.*

Whilst young, preserve his tender mind from all impressions of *spirits* and goblins in the dark. *Id.*

God has changed men's tempers with the times, and made a *spirit* of building succeed a *spirit* of pulling down. *South.*

There is in wine a mighty *spirit*, that will not be congealed. *Id.*

The same disaster has invaded his *spirituals*; the passions rebel; and there are so many governours that there can be no government. *Id.*

A pleasure made for the soul, suitable to its *spirituality*, and equal to all its capacities. *Id.*

Many secret indispositions and aversions to duty will steal upon the soul, and it will require both time and close application of mind to recover it to such a frame as shall dispose it for the *spiritualities* of religion. *Id.*

Art thou so base, so *spiritless* a slave?
Not so he bore the fate to which you doomed him. *Smith.*

Of common right, the dean and chapter are guardians of the *spiritualities*, during the vacancy of a bishoprick. *Ayliffe.*

He showed the narrow *spiritedness*, pride, and ignorance of pedants. *Addison.*

Nor once disturb their heavenly *spirits*
With Scapin's cheats, or Cæsar's merits. *Prior.*

If man will act rationally, he cannot admit any competition between a momentary satisfaction, and an everlasting happiness, as great as God can give and our *spiritualized* capacities receive. *Rogers.*

All men by experience find the necessity and aid of the *spirits* in the business of concoction. *Blackmore.*

Some, who pretend to be of a more *spiritual* and refined religion, spend their time in contemplation, and talk much of communion with God. *Calamy's Sermons.*

All *spirits*, by frequent use, destroy, and at last extinguish, the natural heat of the stomach. *Temple.*

In distillations, what trickles down the sides of the receiver, if it will not mix with water, is oil; if it will, it is *spirit*. *Arbuthnot on Aliments.*

The ministry had him *spirited* away, and carried abroad, as a dangerous person. *Arbuthnot and Pope.*

The most *spirituous* and most fragrant part of the plant exhales by the action of the sun. *Arbuthnot.*

All creatures, as well *spiritual* as corporal, declare their absolute dependence upon the first Author of all beings, the only self-existent God. *Bentley.*

I shall depend upon your constant friendship; like the trust we have in benevolent *spirits*, who, though we never see or hear them, we think are constantly praying for us. *Pope.*

In some fair body thus the secret soul
With *spirits* feeds, with vigour fills the whole:
Each motion guides, and every nerve sustains,
Itself unseen, but in the effects remains. *Id.*

Dryden's translation of Virgil is noble and *spirited*. *Id.*

The king's party, called the cavaliers, began to recover their *spirits*. *Swift.*

Many officers and private men *spirit* up and assist those obstinate people to continue in their rebellion.

Id.

The clergy's business lies among the laity; nor is there a more effectual way to forward the salvation of men's souls, than for *spiritual* persons to make themselves as agreeable as they can in the conversations of the world.

Id.

If we seclude space, there will remain in the world but matter and mind, or body and *spirit*.

Watts's Logick.

You are all of you pure *spirits*. I don't mean that you have not bodies that want meat and drink, and sleep and clothing; but that all that deserves to be called you is nothing else but *spirit*.

Law.

Every thing that you call yours, besides this *spirit*, is but like your cloathing: sometimes that is only to be used for a while, and then to end, and die, and wear away.

Id.

He is the devout man, who lives no longer on his own will, or the way and *spirit* of the world, but to the sole will of God.

Id.

He is always forced to drink a hearty glass, to drive thoughts of business out of his head, and make his *spirits* drowsy enough for sleep.

Id.

She loves them as her *spiritual* children, and they

reverence her as their *spiritual* mother, with an affection far above that of the fondest friends.

Id.

SPIRIT, in metaphysics, an incorporeal being or intelligence; in which sense God is said to be a spirit, as are angels and the human soul. See **ANGEL**, **METAPHYSICS**, and **THEOLOGY**.

SPIRIT, in chemistry and pharmacy, a name applied to every volatile liquid which is not insipid like phlegm or water; and hence the distinction into acid, alkaline, and vinous spirits. See **PHARMACY**, **INDEX**.

SPIRIT, **PYRO-ACETIC**. Some dry acetate exposed to heat in a retort yield a quantity of a light volatile spirit, to which the above name is given. When the acetate is easily decomposed by the fire it affords much acid and little spirit; and, on the contrary, it yields much spirit and little acid when a strong heat is required for its decomposition. The acetates of nickel, copper, &c., are in the first condition; those of barytes, potash, soda, strontian, lime, manganese, and zinc, are in the second. The following table of M. Chenevix exhibits the products of the distillation of various acetates:—

TABLE of Pyro-acetic Spirit.

		Acetate of Silver.	Acetate of Nickel.	Acetate of Copper.	Acetate of Lead.	Peracetate of iron.	Acetate of Zinc.	Acetate of Manganese.
Loss by the fire		0·36	0·61	0·64	0·37	0·49		0·555
Residuum.	State of the base	metallic.	metallic.	metallic.	metallic.	bl. oxide.	wh. oxide.	br. oxide.
	Residue Carbon.	0·05	0·14	0·055	0·04	0·02	0·05	0·035
Liquid products	Specific gravity	1·0656	1·0398	1·0556	0·9407	1·011	0·8452	0·8264
	Ratio of acid	107·309	44·731	84·863	3·045	27·236	2·258	1·285
	Pyro-acetic spirit	0	almost 0	0·17	0·555	0·24	0·695	0·94
Gaseous products	Carbonic acid	8	35	10	20	18	16	20
	Carbonate hydro.	12	60	34	8	34	28	32
	Total gas	20	95	44	28	52	44	52

We see that, of all the acetates, that of silver gives the most concentrated and purest acetic acid, since it contains no pyro-acetic spirit. This spirit is limpid and colorless. Its taste is at first acrid and burning, then cooling, and in some measure urinous. Its odor approaches that of peppermint mingled with bitter almonds. Its specific gravity is 0·7864. It burns with a flame interiorly blue, but white on the outside. It boils at 138·2 Fahrenheit, and does not congeal at 5° Fahrenheit. With water it combines in every proportion, as well as with alcohol, and most of the essential oils. It dissolves but a little of sulphur and phosphorus, but camphor in very large quantity.

Caustic potash has very little action on the pyro-acetic spirit. Sulphuric and nitrous acids decompose it; but muriatic acid forms with this body a compound, which is not acid, and in which we can demonstrate the presence of the muriatic acid only by igneous decomposition. Hence we perceive that pyro-acetic spirit is a peculiar substance, which resembles the ethers, alcohol, and volatile oils. To obtain it cheaply we may employ the acetate of lead of commerce.

After having distilled this salt in an earthen retort, and collected the liquid products in a globe, communicating by a tube with a flask surrounded with ice, we saturate these products with a solution of potash or soda, and then separate the spirit by means of a second distillation, taking care to use a regulated heat. As it usually carries over with it a little water, it is proper to rectify it from dry muriate of lime.—*Ann. de Chimie*, tom. 69.

SPIRITUOUS LIQUORS. Moralists, philosophers, and divines, in all ages, and in almost all countries (for all countries abound in some kind of spirituous liquors), have exclaimed against the abuse of spirituous liquors, and with justice; for no human invention has ever tended more to corrupt the morals, and ruin the character, constitution, and circumstances, of numberless individuals, than habitual and excessive indulgence in spirituous liquors. But, while these abuses of them are to be regretted, their proper use and importance should not be overlooked. The learned Dr. Rush of Philadelphia has written much upon this subject; and, in his zeal for the health and morals of the people, proposes a total

abolition of the manufacture. In this we differ from that learned physician. Spirituous liquors are not only useful in social life, as a means of conviviality, but in many cases highly beneficial as a medicine. In cases of sudden faintings, apoplectic fits, extreme debility, and, above all, in cases of excessive perspiration, there is no remedy or antidote so speedy and certain in affording effectual relief, except to such as have ruined their constitutions by excessive indulgence in them, as a glass of good spirits. These have another advantage, that, in cases of sudden emergency, they are always at hand; whereas few persons in health keep an assortment of medicines in their possession; and the surgeon, physician, and laboratory, are often at a great distance.

Spirituous liquors have in all nations been considered as a proper subject of heavy taxation for the support of the state. This has naturally occasioned a nice examination of their strength. It having been at last found that this was intimately connected with the specific gravity, this has been examined with the most scrupulous attention to every circumstance which could affect it, so that the duties might be exactly proportioned to the quantity of spirit in any strong liquor, independent of every other circumstance of flavor or taste, or other valued quality. The chemist at last found that the basis of all strong liquors is the same, produced by the vinous fermentation of pure saccharine matter dissolved in water. He also found that whether this vegetable salt be taken as it is spontaneously formed in the juices of plants and fruits, or as it may be formed or extricated from farinaceous fruits and roots by a certain part of the process of vegetation, it produces the same ardent spirit, which has always the same density in every mixture with water. The minute portions of aromatic oils, which are in some degree inseparable from it, and give it a different flavor, according to the substance from which it was obtained, are not found to have any sensible effect on its density or specific gravity. This seems very completely established in consequence of the unwearied attempts of the manufacturers to lessen the duties payable on their goods by mixtures of other substances, which would increase their density without making them less palatable. The vigilance of the revenue officers was no less employed to detect every such contrivance. In short, it is now an acknowledged point that the specific gravity is an accurate test of the strength. But it was soon found, by those who were appointed guardians of the revenue, that a mixture which appeared to contain thirty-five gallons of alcohol did really contain thirty-five and a half. This they found by actually making such a mixture: eighteen gallons of alcohol mixed with eighteen of water produced only thirty-five gallons of spirits. The revenue officers, finding that this condensation was most remarkable in mixtures of equal parts of water and the strongest spirits which could then be procured, determined to levy the duties by this mixture; because, whether the spirituous liquor was stronger or weaker than this, it would appear, by its specific gravity, rather stronger than it really was. This

sagacious observation, and the simplicity of the composition, which could at all times be made for comparison, seem to be the reasons for our excise officers selecting this mode of estimating the strength and levying the duties. A mixture of nearly equal measures of water and alcohol is called proof spirit, and pays a certain duty per gallon; and the strength of a spirituous liquor is estimated by the gallons, not of alcohol, but of proof spirit which the cask contains. But, because it might be difficult to procure at all times this proof spirit for comparison, such a mixture was made by order of the board of excise; and it was found that, when six gallons of it was mixed with one gallon of water, a wine gallon of the mixture weighed seven pounds thirteen ounces avoirdupois. The board therefore declared that the spirituous liquor of which the gallon weighed seven pounds thirteen ounces should be reckoned one to six, or one in seven, under proof. This is but an awkward and complex formula: it was in order to suit matters to a mode of examination which had by time obtained the sanction of the board. Mr. Clarke, an ingenious artist of that time, had made a hydrometer incomparably more exact than any other, and constructed on mathematical principles, fit for computation. This had a set of weights corresponding to the additions of water or proof spirit, and the mixture one to six or one in seven was the only one which weighed an exact number of ounces per gallon without a fraction.

SPIRT, *v. n., v. a. & n. s.* } Belg. *spruyten*, to
SPIR'TLE, *v. a.* } shoot up (Skinner);
Swed. *spritta*, to fly out (Lye); Goth. *sprita*.
See SPRIT. To spring out in a sudden stream: stream out by intervals; throw out in a jet: sudden ejection or effort: to spirtle is a corruption of spirit.

Bottling of beer, while new and full of spirit, so that it *spirteth* when the stopple is taken forth, maketh the drink more quick and windy.

Bacon's Natural History.
The brains and mingled blood were *spirted* on the wall. *Dryden.*

When weary Proteus
Retired for shelter to his wonted caves,
His finny flocks about their shepherd play,
And, rowling round him, *spirt* the bitter sea.

Dryden.

When rains the passage hide,
Oft the loose stones *spirt* up a muddy tide
Beneath thy careless foot. *Gay*
The terraqueous globe would, by the centrifugal force of that motion, be soon dissipated and *spirted* into the circumambient space, was it not kept together by this noble contrivance of the Creator.

Derham's Physico-Theology.

Thus the small jett, which hasty hands unlock,
Spirts in the ga. dener's eyes who turns the cock.

Pope.

SPIRY, *adj.* From SPIRE. Pyramidal; wreathed; curled.

I hid in the *spiry* volumes of the snake,
I lurked within the covert of a brake. *Dryden.*
In these lone walls, their days eternal bound,
These moss-grown domes with *spiry* turrets-crowned,
Where awful arches make a noon-day night,
And the dim windows shed a solemn light,

Thy eyes diffused a reconciling ray,
And gleams of glory brightened all the day. *Pope.*

SPISS, *adj.* } Lat. *spissus*. Close; firm;
SPISSITUDE, *n. s.* } thick: the noun substantive
corresponding. Not in use.

From his modest and humble charity, virtues which rarely cohabit with the swelling windiness of much knowledge, issued this *spiss* and dense yet polished, this copious yet concise, treatise of the variety of languages. *Brerewood.*

Drawing wine or beer from the lees, called racking, it will clarify the sooner; for, though the lees keep the drink in heart, and make it lasting, yet they cast up some *spissitude*. *Bacon.*

Spissitude is subdued by acrid things, and acrimony by inspissating. *Arbuthnot on Aliments.*

SPIT, *n. s. & v. a.* } Sax. *spitan*; Belg. *spit*;
SPITTED, *adj.* } Ital. *spedo*. A long prong on which meat is driven, to be turned before the fire: the depth of a spade in digging: to put on a spit; thrust through: spitted is shot out into length.

A goodly city is this Antium;
Tis I that made thy widows: then know me not,
Lest that thy wives with *spits*, and boys with stones,
In puny battle slay me. *Shakspeare. Coriolanus.*

I see my cousin's ghost

Seeking out Romeo, that did *spit* his body

Upon a rapier's point. *Shakspeare.*

Whether the head of a deer, that by age is more *spitted*, may be brought again to be more branched. *Bacon.*

They may be contrived to the moving of sails in a chimney corner, the motion of which may be applied to the turning of a *spit*.

Wilkins's Mathematical Magick.

Where the earth is washed from the quick, face it with the first *spit* of earth dug out of the ditch. *Mortimer.*

I *spitted* frogs, I crushed a heap of emmets. *Dryden.*

With Peggy Dixon thoughtful sit,
Controlling a raper for the pot and *spit*. *Swift.*

SPIT, *v. a., v. n. & n. s.* } Sax. *spætan*; Dan.
SPITTE, *n. s.* } *spytter*; Swed. *spitta*;
Lat. *spulo*. To eject from the mouth: throw out spittle: the saliva of the mouth.

He *spat* on the ground, made clay of the spittle, and anointed the eyes of the blind man. *John ix. 6.*

And when he had *spat* on the ground, he anointed his eyes. *Gospel.*

A large mouth, indeed,
That *spits* forth death and mountains. *Shakspeare.*

Very good orators, when they are here, will *spit*. *Id.*

The watery kingdom, whose ambitious head
Spits in the face of heaven, is no bar
To stop the foreign spirits, but they come. *Id.*

The sea thrusts up her waves,
One after other, thicke and high, upon the groaning shores;

First in herself loud, but opposed with banks and rocks, she roars,

And all her backe, in bristles set, *spits* every way her fume. *Chapman.*

Mænas and Atys in the mouth were bred,
And never hatched within the lab'ring head;
No blood from bitten nails those poems drew,
But churned, like *spittle*, from the lips they flew. *Dryden.*

The saliva or *spittle* is an humour of eminent use. *Ray.*

A drunkard men abhor, and would even *spit* at him, were it not for fear he should something more than *spit* at them. *South.*

The *spittle* is an active liquor, immediately derived from the arterial blood: it is saponaceous. *Arbuthnot.*

A genius for all stations fit,
Whose meanest talent is his wit:
His heart too great, though fortune little,
To lick a rascal statesman's *spittle*. *Swift.*
Spit on your finger and thumb, and pinch the snuff till the candle goes out. *Id. Rules for Servants.*

SPITCH'COCK, *v. a.* To cut an eel in pieces and roast him; or rather the eel so roasted: of Teut. *spits kochen*; i. e. that which is cooked on a spit.

No man lards salt pork with orange peel, Or garnishes his lamb with *spitchcock* eel. *King.*

SPITE, *n. s. & v. a.* } Fr. *despit*; Belg. *spijt*;
SPITEFUL, *adj.* } Ital. *spetto*. Malice;
SPITEFULLY, *adv.* } rancor; malignity; ma-
SPITEFULNESS, *n. s.* } levolution: 'in spite of' is in defiance of: to spite is to vex; treat with malice; offend: the adjective and adverb correspond.

This breeding rather *spite* than shame in her, or, if it were a shame, a shame not of the fault but of the repulse, she did thirst for a revenge. *Sidney.*

So with play did he a good while fight against the fight of Zelmene, who, more *spited* with that courtesy, that one that did nothing should be able to resist her, burned away with choler any motions which might grow out of her own sweet disposition. *Id.*

The Jews were the deadliest and *spitefullest* enemies of Christianity that were in the world, and in this respect their orders to be shunned. *Hooker.*

Beguled, divorced, wronged, *spighted*, slain, Most detestable death, by thee. *Shakspeare.*

All you have done

Hath been but for a wayward son,
Spiteful and wrathful. *Id. Macbeth.*

I'll guard thee free,
And save thee in her *spite*. *Chapman.*

Our publick form of divine service and worship is in every part thereof religious and holy, maugre the malice of *spiteful* wretches who have deprived it. *White.*

Bewray they did their inward boiling *spite*,
Each stirring others to revenge their cause. *Daniel.*

Done all to *spite*

The great Creator; but their *spite* still serves
His glory to augment. *Milton's Paradise Lost.*
Twice false Evadne, *spitefully* forsworn!
That fatal beast like this I would have torn. *Waller.*

Darius, *spited* at the magi, endeavoured to abolish not only their learning but their language. *Temple.*

In *spite* of me I love, and see too late
My mother's pride must find my mother's fate. *Dryden.*

The *spiteful* stars have shed their venom down,
And now the peaceful planets take their turn. *Id.*

In fireworks give him leave to vent his *spite*;
Those are the only serpents he can write. *Id.*

Blessed be such a preacher, whom God made use of to speak a word in season, and saved me in *spite* of the world, the devil, and myself. *South.*

Contempt is a thing made up of an undervaluing of a man, upon a belief of his utter uselessness, and a *spiteful* endeavour to engage the rest of the world in the same slight esteem of him. *Id.*

For thy loved sake, *spite* of my boding fears,
I'll meet the danger which ambition brings. *Rowe.*

My father's fate,

In spite of all the fortitude that shines
Before my face in Cato's great example,
Subdues my soul, and fills my eyes with tears.

Addison.

It looks more like *spitefulness* and ill-nature than a
diligent search after truth. *Keil against Burnet.*

In spite of all applications, the patient grew worse
every day. *Arbutnot.*

Begone, ye critics, and restrain your *spite*;
Codrus writes on, and will for ever write. *Pope.*

Vanessa sat,

Scarce listening to their idle chat,
Further than sometimes by a frown,
When they grew pert, to pull them down :
At last she *spitefully* was bent
To try their wisdom's full extent. *Swift.*

The cause is plain, and not to be denied,
The proud are always most provoked by pride ;
Few competitions but engender *spite*,
And those the most, where neither has a right.

Courper.

SPITHEAD, a roa between Portsmouth and
the Isle of Wight, where the royal navy of Great
Britain frequently rendezvous.

SPIT'TLE, *n. s.* Corrupted from hospital,
and therefore better written spital. Hospital. It
is still retained in Scotland.

To the *spittle* go,

And from the powdering tub of infamy
Fetch forth the lazar kite of Cressid's kind.

Shakspeare. Henry V.

This is it

That makes the waned widow wed again,
She whom the *spittle* house, and ulcerous sores,
Would cast the gorge at. *Id. Timon.*
Cure the *spittle* world of maladies. *Cleveland.*

SPITTLE, in physiology. See SALIVA.

SPITZBERGEN, or East Greenland, a name
that has been given to a group of islands in the
Northern Ocean, formerly supposed to make
part of the continent. They are situated between
76° 30' and 80° 30' N. lat., and between 9° and
20° E. long. The land was first discovered by
Sir Hugh Willoughby in the year 1553, who
called it Groenland. In 1595 it was again
visited by Barentz and Cornelius, two Dutch-
men, who pretended to be the original discover-
ers, and called the country Spitzbergen, or
Sharp Mountains, from the many sharp-pointed
and rocky mountains with which it abounds.
They alleged that the coast discovered by Sir
Hugh Willoughby was some other country ;
which accordingly the Hollanders delineated on
their maps and charts by the name of Willough-
by Land ; whereas in fact no such land ever ex-
isted ; and, long before the voyage of these
Dutchmen, Barrows, an English shipmaster, had
coasted along a desolate country from lat. 78° to
80° 11' N., which was undoubtedly Spitzbergen.
The sea in the neighbourhood abounding in
whales, this country has been long the common
resort of the fishing ships from different coun-
tries. But, till the voyage of captain Phipps in
1773, the situation of the country was erroneously
laid down.

This group extends further north than any
other country yet discovered, and approaches
within ten degrees of the pole. Spitzbergen is
encompassed by the Arctic Ocean, and, though
annually visited by vessels engaged in the whale-

fishery, it does not ever appear to have been
permanently inhabited. The main-land stretches
about 300 miles, nearly in the direction of the
meridian, as South Cape is in lat. 76° 30', and
the opposite extremity in 80° 7' of latitude ; and
even one of the islands reaches 80° 40'.

The climate of these dreary regions is almost
always intensely cold ; and even in the three
warmest months in the year, when the sun con-
stantly shines, and the air is usually clear, the
mean temperature is only about 34° 30' of Fah-
renheit's scale ; while, during this period, the
thermometer is often below the freezing point.
The sun shines without setting for about four
months in the year, and which has, therefore,
been called their longest day. But, after he has
passed the equinox, the approach of winter
becomes very rapid. The sun sinks wholly
below the horizon, and the temperature dimin-
ishes till the cold becomes intense. The birds
of passage take their flight to milder regions,
and the beasts that remain retire to their winter
abodes. At this season the bear alone roams
abroad. But man, as if determined to contest
the sovereignty of desolation with this arctic
monster, has even dared to winter on these bleak
shores. Actuated by the prospect of gain to be
derived from the opportunities of hunting and
fishing during the winter, several adventurers
annually proceed from Archangel and other
ports on the White Sea, in small vessels fitted
out for the purpose, and supplied with provisions
and stores of all kinds that may be requisite for
their support. Fuel, and huts ready constructed,
are also taken out. These vessels either winter in
some of the most obscure coves along the coast,
or return with the members of the small colony,
and the produce of their labors, that had been
left the preceding year. As soon as they arrive
at the place of their destination, the huts are
erected, and the sailors remain on shore during
the winter. Being accustomed to so severe a
climate in their own country, they are seldom
prevented from going abroad, unless when buried
beneath the snow, which sometimes happens.
In such cases they are obliged to make their way
through the chimney to get out. The object of
the adventurers is to kill whales, seals, sea-
horses, bears, rein-deer, and arctic foxes. In-
stead of receiving wages from their employers,
they are supplied with provisions and other
stores, and are entitled to a certain portion of
the produce of their labors when they return.
Some of them are even hardy enough to prolong
their stay for two or three years ; but in that
case they often fall victims to the fatal effects
of the scurvy, which is the great bane of those
regions. Though the sun remains below the
horizon for about four months in the year, it is
seldom very dark during that season ; for the
brightness of the moon, which sometimes shines
for nearly fourteen days together, the resplen-
dent brilliancy of the stars, and the reflection of
the aurora borealis, which often resembles a
blaze of fire, afford sufficient light to read by.
The surface of Spitzbergen presents a scene or
rugged nakedness and desolation, which is,
perhaps, unparalleled. Buried beneath almost
perpetual snow, its vegetable productions are

nearly all of the incumbent classes. A few mosses, lichens, and other arctic plants, make up the scanty catalogue. The only semblance of a shrub is the dwarf willow, which, in comparison, towers above all the other tribes, though seldom rising to more than two inches in height. The scenery of Spitzbergen is strikingly sublime and awfully grand; but it is a brilliancy of desolation, which rather astonishes than pleases—a chaotic confusion that chills while it delights, and rather overwhelms than elevates the mind.

Mr. Scoresby, in his late very interesting and valuable work on these regions, to which he had previously made seventeen voyages, thus describes the general appearance of Spitzbergen. 'The principal objects which strike the eye are innumerable mountainous peaks, ridges, precipices, or needles, rising immediately out of the sea, to an elevation of 3000 or 4000 feet, the color of which, at a moderate distance, appears to be blackish shades of brown, green, gray, and purple, snow or ice, in striæ or patches, occupying the various clefts and hollows in the sides of the hills, capping some of the mountain summits, and filling with extended beds the most considerable valleys; and ice of the glacier form, occurring at intervals, all along the coast, in particular situations, as already described, in prodigious accumulations. The glistening, or vitreous appearance of the iceberg precipices; the purity, whiteness, and beauty of the sloping expanse, formed by their snowy surfaces; the gloomy shade presented by the adjoining or intermixed mountains and rocks, perpetually covered with a mourning veil of black lichens, with the sudden transition into a robe of purest white where patches or beds of snow occur, presents a variety and extent of contrast altogether peculiar; which, when enlightened by the occasional ethereal brilliancy of the polar sky, and harmonised in its serenity with the calmness of the ocean, constitute a picture both novel and magnificent. There is indeed a kind of majesty, not to be conveyed in words, in these extraordinary accumulations of snow and ice in the valleys, and in the rocks above rocks, and peaks above peaks, in the mountain groups, seen rising above the ordinary elevation of the clouds, and terminating occasionally in crests of everlasting snow, especially when you approach the shore under the impenetrable density of a summer fog; in which the fog sometimes disperses like the drawing of a curtain, when the strong contrast of light and shade, heightened by a cloudless atmosphere, and powerful sun, burst on the senses in a brilliant exhibition, resembling the productions of magic.'—The highest summit that was determined by Captain Phipps was 4500 feet, and Captain Scoresby ascertained the elevation of one of these peaks, in 1815, that rose to the height of 4395 feet above the level of the sea.

The most remarkable circumstance attendant on these regions is the deception they present in reference to the distance of objects. When a person most accustomed to judge of distances in other places approaches Spitzbergen, his experience seems to vanish, and his estimate of the

distance seldom exceeds a small portion of the reality. In clear weather the high land of this island is well defined, and every thing appears distinct at the distance of forty miles. When twenty miles from the shore, it is no uncommon circumstance for seamen to conceive themselves within a league of the land; and Mr. Scoresby says he has known experienced mariners who have 'imagined they could not stand an hour towards the land without running aground; and yet the ship has sailed three or four hours directly in shore and still been remote from danger. If after coming in sight of Spitzbergen in clear weather, and sailing for four or five hours directly towards the shore, the atmosphere becomes a little hazy, or even dark and cloudy, the vessel may appear to be further distant than when the land was first seen.' This Mr. Scoresby thinks satisfactorily accounts for the conduct of the Danish Captain, Hogens Heinson, who was a renowned seaman of that time, and was sent in search of the lost colony in Greenland. After surmounting many difficulties, he perceived the coast of Greenland, and with a clear sea, a favorable wind, and a fresh gale, he sailed for several hours towards it; but, not appearing to be any nearer the land, he became alarmed, tacked about, and returned to Denmark, saying that his ship had been stopped in her course by 'some load-stone rocks hidden in the sea.'

Mr. Scoresby, in the description of one of his excursions on shore, thus delineates the appearance of that part of the country, as seen from the summit of one of the mountains. 'The prospect was most extensive and grand. A fine sheltered bay was seen on the east of us, an arm of the same on the north-east, and the sea, whose glassy surface was unruffled by a breeze, formed an immense expanse on the west; the icebergs, rearing their proud crests almost to the tops of the mountains, between which they were lodged, and defying the power of the solar beams, were scattered in various directions about the sea coast and in the adjoining bays. Beds of snow and ice filling extensive hollows, and giving an enamelled coat to adjoining valleys, one of which, commencing at the foot of the mountain where we stood, extended in a continued line towards the north as far as the eye could reach; mountain rising above mountain, until by distance they dwindled into insignificance; the whole contrasted by a cloudless canopy of deepest azure, and enlightened by the rays of a blazing sun, and the effect aided by a feeling of danger seated as we were on the pinnacle of a rock, almost surrounded by tremendous precipices; all united to constitute a picture singularly sublime. Here we seemed elevated into the very heavens, and, though in a hazardous situation, I was sensible only of pleasing emotions, heightened by the persuasion that, from experience in these kind of adventures, I was superior to the dangers with which I was surrounded. The effect of the elevation, and the brightness of the picture, were such that the sea, which was at least a league from us, appeared within reach of a musket-shot; mountains a dozen miles off seemed scarcely a league from us, and our vessel, which we knew was at the

distance of a league from the shore, appeared in danger of rocks.

The atmosphere has a remarkable antiseptical effect. Animal and vegetable substances, exposed to the influence of the air, remain for a long period unchanged. Martens, in the account of his voyage to Spitzbergen, says, 'That a man buried ten years before, still retained his perfect shape and dress.' M. Bleau also remarks, in his *Atlas Historique*, that the bodies of the seven Dutchmen who perished in Spitzbergen, in 1635, were found twenty years afterwards, without having suffered the least putrefaction. Wood and other vegetable substances are preserved in a similar manner. Mr. Scoresby says that when he attempted to explore the shores of Spitzbergen, in 1818, he saw several huts, and some coffins made entirely of wood. 'One of the latter,' he says, 'appeared, by an adjoining inscription, to contain the body of a native of Britain who had died in the year 1788; and though the coffin had lain completely exposed, except when covered with snow, during a period of thirty years, the wood of which it was composed not only was undecayed, but appeared quite fresh and new. It was painted red; and the color even seemed to be but little faded. Things of a similar kind have been met with in Spitzbergen, which have resisted all injury from the weather during the lapse of a century.' One of the most interesting appearances on these coasts is the iceberg. It frequently extends several miles in length, and rises perpendicularly above the sea to the height of 400 or 500 feet, exhibiting various shades, from an emerald green to an appearance of cliffs of white marble.

Islands in the adjacent seas are Moffen Island, situated in lat. 80° 1', and long. 12° 43' east. It is a small island, and of comparatively low land. Low Island is nearly in the same latitude, but about 5° more to the east. Hope Island, on the south-east coast of Spitzbergen, is in lat. 76° 20', and long. 20° east. Cherie Island is in the same longitude, but is situated about 2° further south than Hope Island.—Jan Mayen Island is in lat. 71° and long. about 8° west. It is ten leagues in length, but not more than three leagues broad; and derives its name from the Dutch captain by whom it was discovered, in the early part of the seventeenth century. The highest point of this island is the peak of Beerenberg, which rears its icy summit far above the clouds. The height Scoresby determined in 1817 to be 6870 feet. Besides the islands already described, the Russians possess various others on the east of Asia, situated between the coasts of Asia and America, and some near the shores of the latter continent. These islands have many excellent bays and anchorages.

SPIXWORTH, a town of England, near Norwich.

SPLACHNUM, in botany, a genus of plants belonging to the class of cryptogamia, and order of musci. The antheræ are cylindrical, and grow on a large colored apophysis or umbraculum. The calyptra is caducous. The female stamens on a separate stem. There are six species; viz. 1. *Splachnum ampullaceum*; 2. *Angustatum*; 3. *Luteum*; 4. *Rubrum*; 5. *Sphæricum*; and,

6. *Vasculosum*. Two of these are natives of Britain; viz. 1. *S. ampullaceum*, the crewet splachnum, is found in bogs and marshes, and often upon cow-dung. It grows in thick tufts, and is about two inches high. The leaves are oval lanceolate, terminated with a long point or beard. The top of the filament or peduncle swells into the form of an inverted cone, which Linnæus terms an apophysis or umbraculum; upon the top of which is placed a cylindrical antheræ, like the neck of a crewet. The calyptra is conical, and resembles a small extinguisher. 2. *S. vasculosum*, the acorn-shaped splachnum, is found upon bogs and cow-dung, and upon the points of rocks on the top of the Highland mountains, as on Ben-Lomond, and in the Isle of Sky, and elsewhere. This differs little from the preceding, and perhaps is no more than a variety. The filaments are about an inch high. The leaves oval acute, not so lanceolate and bearded as the other. The apophysis, and the anthera at the top of it, form together nearly an oval figure, not unlike an acorn in its cup, the apophysis being transversely semi-oval, and of a blood-red color, the anthera short and conical. The calyptra is the same as that of the other. The operculum is short and obtuse, and the rim of the anthera has eight large horizontal cilia. The anthera of the other is also ciliated, but not so distinctly. It is an elegant moss, and very distinguishable on account of its orange-colored filaments and dark-red capsules.

SPLAYFOOT, *adj.* } Splay, or display,
SPLAYMOUTH, *n. s.* } and foot. Having the foot turned inward: an unnaturally wide mouth.

All authors to their own defects are blind:
Hadst thou but, Janus-like, a face behind,
To see the people when *splaymouths* they make,
To mark their fingers pointed at thy back,
Their tongues lolled out a foot. *Dryden.*

Though still some traces of our rustic vein,
And *splayfoot* verse remained, and will remain.

Pope.

SPLEEN, *n. s.* } Lat *splen*. The milt;
SPLEEN'ED, *adj.* } one of the viscera, of
SPLEENFUL, } which the use is not
SPLEENLESS, } known: supposed to be
SPLEEN'WORT, *n. s.* } the seat of anger, me-
SPLEEN'Y, *adj.* } lancholy, and mirth:
SPLEEN'ETIC, } hence anger, ill-humor;
SPLEEN'IC, } a fit of anger or mel-
SPLEEN'ISH, } choly: spleened is de-
SPLEEN'ITIVE. } prived of the spleen:
spleenful, angry; petulant; melancholy. as also spleeny and the last four adjectives, signify. spleenless; kind; mild (obsolete): spleenwort is a plant.

If she must teem,
Create her child of *spleen*, that it may live
And be a thwart disnatured torment to her.

Shakspeare.

Charge not in your *spleen* a noble person,
And spoil your nobler soul. *Id.*

Brief as the lightning in the collied night,
That in a *spleen* unfolds both heaven and earth,
And, ere a man hath power to say, behold!
The jaws of darkness do devour it up. *Id.*

They that desire the *spleen*, and would die
with *Id.*

Take thy fingers from my throat ;
For though I am not *splenetic* and rash,
Yet I have in me something dangerous.

Id. Hamlet.

The commons, like an angry hive of bees
That want their leader, scatter up and down :
Myself have calm'd their *spleneful* mutiny.

Id. Henry VI.

What though I know her virtuous, her
And well deserving ; yet I know her for
A *spleeny* Lutheran, and not wholesome to
Our cause.

Id. Henry VIII.

Yourselves you must engage
Somewhat to cool your *spleenish* rage,
Your grievous thirst ; and to asswage
That first, you drink this liquor.

Drayton.

Kind pity checks my *spleen* ; brave scorn forbids
Those tears to issue, which swell my eye-lids.

Donne.

His solemn queen, whose *spleene* he was dispos'd
To tempt yet further, knowing well what anger it
inclosed,

And how wives anger should be used.

Chapman.

Mean time flew our ships, and straight we fetcht
The syrens' isle ; a *spleenless* wind so stretch
Her wings to waft us, and so urged our keel.

Id.

Suppose the *spleen* obstructed in its lower parts
and *splenick* branch, a potent heat causeth the or-
gasmus to boil.

Harvey.

All envied ; but the Thestyan brethren show'd
The least respect, and thus they vent their *spleen*
aloud :

Lay down those honoured spoils.

Dryden.

The cheerful soldiers, with new stores supplied,
Now long to execute their *spleneful* will.

Id.

Horace purged himself from these *splenetic* re-
flections in odes and epodes, before he undertook his
satires.

Id.

The *splenick* vein hath divers cells, opening into it
near its extremities in human bodies ; but in quad-
rureds the cells open into the trunks of the *splenick*
veins.

Ray on the Creation.

This daughter silently lowers, t'other steals a kind
look at you, a third is exactly well-behaved, and a
fourth a *splenetic*.

Tatler.

The *spleen* with sullen vapours clouds the brain,
And binds the spirits in its heavy chain ;
Howe'er the cause fantastick may appear,
Th' effect is real, and the pain sincere.

Blackmore.

Animals *splenick* grow salacious.

Arbutnot.

If the wound be on the left hypochondrium, under
the short ribs, you may conclude the *spleen* wounded.

Wiseman.

In noble minds some dregs remain,
Not yet purged off, of *spleen* and sour disdain.

Pope.

If you drink tea upon a promontory that overhangs
the sea, the whistling of the wind is better musick
to contented minds than the opera to the *spleneful*.

Id.

Safe passed the gnome through this fantastick band,
A branch of healing *spleenwort* in his hand.

Id.

Spleen, vapours, and small-pox above them all.

Id.

You humour me when I am sick ;
Why not when I am *splenetic* ?

Swift.

For not on beds of gaudy flowers
Thine ancestors reclined,
Where sloth dissolves, and *spleen* devours
All energy of mind.

Beattie.

Mine be the friend less frequent in his prayers,
Who makes no bustle with his soul's affairs,
Whose wit can brighten up a wintry day,
And chase the *splenetic* dull hours away.

Cowper.

SPLEEN. The use of the spleen remains a
problem, towards the elucidation of which the
investigations of so many anatomists and phy-
siologists have hitherto afforded very imperfect
data. Haller admonishes his reader that ' he is
plunging into the region of mere conjecture,'
darker than in the case of any other viscus.
We might have hoped to derive some light from
the diseases under which it frequently suffers,
and from the experiments in which it has been
removed in animals. The inferences, however,
to which we arrive in this way, are only of the
negative kind ; they enable us to destroy or
refute, but not to build up or establish. The
spleen may be found considerably altered in
texture where the individual has enjoyed good
health before death, or has died of other com-
plaints. It is often enormously enlarged, with-
out materially affecting the health ; and, on the
other hand, where ill-effects are produced, they
have no peculiar character, affording illustration
of the use of the organ. The experiment of re-
moving the spleen seems to have been performed
very anciently.

Pliny says that animals will live after this
part has been torn out (lib. xi. c. 30) ; and the
same fact is noticed in the Talmud (Ginz-
burger, Medic. Talmud. p. 11). Haller cites
various instances in which the spleen has been
lost in the human subject ; particularly Leon.
Fioravanti, tesoro della vita humana, l. ii. c. 8.
Phil. Trans. No. 451. The removal of it from
the dog is an experiment repeated over and over
again. See Haller, t. vi. p. 421. We find that
animals, and even human subjects, have lived
without a spleen, and enjoyed tolerable health.
Sometimes the experiment has been fatal, but not
from the loss or interruption of any function that
could be ascribed to the spleen. We find that
dogs have been lively, fat, and even plethoric ;
that they have had good appetites ; that bitches
have produced young. Some thought they were
more salacious ; others that they made water
more frequently. In some cases appearances
were noticed that might be referred to imperfec-
tion in the digestive process, as borborygmi.
The liver is said to have suffered in a few in-
stances ; in most, however, there seems to have
been good bile made ; and generally no particu-
lar ill effect was experienced. The inference, then,
to be collected from these sources, is that the
function of the spleen is of so little importance,
that the alteration of its texture by disease is not
marked by any unequivocal symptom, and even
that its entire removal is hardly followed by any
sensible effect.

It has been a generally received notion that
the office of the spleen is related to that of the
liver ; that the blood, either by its retarded
motion through the serpentine splenic vessels,
its stagnation in the splenic cells, or other
changes wrought in it by the actions of the
spleen, acquires peculiar properties, rendering it
fit for the secretion of bile in the liver. It is
supposed that the splenic blood is loaded with
carbon, which the action of the liver separates
from it. We do not usually meet with such
arrangements as these in the animal economy ;
indeed no instance could be adduced of the like

nature; one organ to carbonize the blood, that it may be decarbonized by another; or a part to produce changes in the blood, fitting it for the secretion which is to be performed by another. The tissue of each gland has the power of extracting its peculiar secretion from the common mass. That the spleen produces changes in the properties of the blood is not yet clearly proved; still less is it proved that such changes, if produced, are in any way concerned with the biliary secretion. Further, bile is secreted where the spleen has been removed; and it was secreted in the case recorded by Mr. Abernethy, where the vena portarum emptied its blood into the inferior vena cava. We observe no constant relation between the spleen and liver; the former is extremely small in many birds, reptiles, and fishes, where the liver is large. The close neighbourhood of this organ to the stomach, and the connexion of their blood-vessels, have led to the conjecture that they are connected in function. It has been imagined that when the stomach is empty, the spleen, like a sponge, swells with blood, and affords a reservoir for the quantity of that fluid, which the blood-vessels of the stomach do not require in the inactive state of the organ; while, on the contrary, when this bag is distended with food, and the process of digestion demands a more copious afflux of fluids into the stomachic vessels, the pressure of its great extremity empties the splenic sponge, and thus causes a greater flow in the other parts of the cœliac system. This again is all imaginary; not a single point of it founded in observation. It is quite inapplicable to the three lower classes of vertebral animals, where the position of the spleen in many instances, and its firmness in several, are quite incompatible with the explanation.

Sir Everard Home, in two papers published in the Philosophical Transactions for 1808 on the structure and use of the spleen, attempted to prove that fluids are conveyed from the cardiac end of the stomach into the spleen, and thus arrive in the general circulation, without the intervention of the general absorbing system and thoracic duct. Having tied the pylorus, he injected colored fluids into the stomach; they were partly absorbed, and manifested their presence in the circulating system by changes produced in the urine. When rhubarb was used, the cut surface of the spleen produced a decided yellow tint on paper, and the serum of the splenic blood manifested the presence of rhubarb, on the addition of potash; when no such phenomena were exhibited by the cut surface of the liver, or in the serum of blood from the vena cava. There was a corresponding difference between the effects of potash on fluids, in which the substance of the liver and that of the spleen were broken up. The author abandons this notion in a subsequent communication to the same society, on the passage of fluids from the stomach into the general circulation; having found that corresponding phenomena were exhibited, after the spleen had been removed.—Philosophical Transactions, 1812. Of numerous other fancies about this mysterious organ, such as that it forms the red globules of

the blood, that it is the seat of laughter, or of the sentient soul, that it is designed to balance the liver, &c., &c., we can say no more than that those who are interested in such speculations will find ample amusement in Haller's Elem. Physiol. lib. xxi. sec. 2; or in Soemmering de Corp. Hum. Fabrica, t. vi. p. 158, et seq.

SPLEEN, in anatomy. See ANATOMY.

SPLEENWORT, in botany, is a species of asplenium, a genus of the cryptogamia class of plants, and ranked in the order of filices. The parts of fructification are situated in the small sparse line under the disk of the leaves. There are twenty-four species: two are natives of Britain, and grow upon old walls and moist rocks: viz. 1. Asplenium ceteracum, ceterach, or spleenwort; 2. Asplenium scolopendrium, or hart's tongue. Spleenwort has an herbaceous, mucilaginous, and roughish taste; it is recommended as a pectoral, and as a nephritic for promoting urine. It was anciently esteemed good against the spleen.

SPLEENWORT, ROUGH, a species of polypodium.

SPLENDID, *adj.* } Fr. *splenaule*; Latin
SPLENDIDLY, *adv.* } *splendidus*. Showy; mag-
SPLENDOUR, *n. s.* } nificent; sumptuous: the
adverb and noun substantive corresponding.

The dignity of gold above silver is not much; the splendour is alike, and more pleasing to some eyes, as in cloth of silver. *Bacon's Physical Remains*.

They assigned them names from some remarkable qualities, that are very observable in their red and splendent planets. *Browne's Vulgar Errors*.

Their condition, though it look *splendidly*, yet, when you handle it on all sides, it will prick your fingers. *Taylor*.

You will not admit you live *splendidly*, yet it cannot be denied but that you live neatly and elegantly. *More*.

Unacceptable, though in heaven, our state
Of *splendid* vassalage. *Milton*.

How he lives and cats,
How largely gives, how *splendidly* he treats. *Dryden*.

He, of the royal store
Splendidly frugal, sits whole nights devoid
Of sweet repose. *Philips*.

Romulus, being to give laws to his new Romans, found no better way to procure an esteem and reverence to them, than by first procuring it to himself by *splendour* of habit and retinue. *South*.

Metallick substances may, by reason of their great density, reflect all the light incident upon them, and so be as opake and *splendent* as it is possible for any body to be. *Newton*.

The first symptoms are a chiliness, a certain *splendour* or shining in the eyes, with a little moisture. *Arbuthnot*.

Deep in a rich alcove the prince was laid,
And slept beneath a pompous colonnade:
Fast by his side Pisistratus lay spread,
In age his equal, on a *splendid* bed. *Pope's Odyssey*.
'Tis use alone that sanctifies expense,
And *splendour* borrows all her rays from sense. *Pope*.

Upon that night, when fairies light
On Cassilis Downans dance,
Or owe the lays, in *splendid* blaze,
On sprightly coursers prance. *Burns*.

SPLENIUS. See ANATOMY

SPLINT, *n. s.* Or perhaps splint. Italian *spinnella*; Belg. *solint*. See **SPLINTER**. Defined in extract

Splints is a callous hard substance, or an insensible swelling, which breeds on or adheres to the shank-bone of a horse, and, when it grows big, spoils the shape of the leg. When there is but one, it is called a single *splint*; but when there is another opposite to it, on the outside of the shank-bone, it is called a pegged or pinned *splint*.

Farrier's Dictionary.

SPLICING, in the sea language, is the untwisting the ends of two cables or ropes, and working the several strands into one another by a fidd, so that they become as strong as if they were but one rope.

SPLINT, or **SPLINTER**, *n. s., v. a., & v. n.* Belg. *splinter*; Dan. *splint*. A fragment of any thing broken with violence: to break into splints or fragments; to secure by means of them: to be broken in this way.

This broken joint intreat her to *splinter*, and this crack of your love shall grow stronger than it was before.

Shakspeare. Othello.

He was slain upon a course at tilt, one of the *splinters* of Montgomery's staff going in at his bever.

Bacon.

Amidst whole heaps of spices lights a ball,
And now their odours armed against them fly;
And some precisely by shattered porcelain fall,
And some by aromatic *splinters* die.

Dryden.

A plain Indian fan used by the meaner sort, made of the small stringy parts of roots, spread out in a round flat form, and so bound together with a *splinter* hoop, and strengthened with small bars on both sides.

Grew's Musæum.

The ancients after the seventh day used *splints* which not only kept the members steady, but straight, and of these some are made of tin, others of scabbard and wood, sewed up in linen cloths.

Wiseman's Surgery.

SPLIT, *v. a. & v. n.* } *Pret. and part. pass.*
SPLINTER, *n. s.* } split. Belg. *spletten*,
splitten. To cleave; rive; to divide longitudinally; dash to pieces; break: to burst asunder; part; to be broken against a hard substance: the noun substantive corresponds.

Do 't, and thou hast the one-half of my heart;
Do 't not, thou *splittest* thine own.

Shakspeare. Winter's Tale.

After our ship did *split*,

When you, and the poor number saved with you,
Hung on our driving boat.

Shakspeare.

God's desertion, as a full and violent wind, drives him in an instant, not to the harbour, but on the rock where he will be irrecoverably *split*.

Decay of Piety.

Wert thou served up two in one dish, the rather
To *split* thy sire into a double father!

Cleveland.

A huge vessel of exceeding hard marble *split* asunder by congealed water.

Boyle.

Cold winter *split* the rocks in twain.

Dryden.

Those who live by shores with joy behold
Some wealthy vessel *split* or stranded nigh;
And from the rocks leap down for shipwrecked gold,
And seek the tempests which the others fly.

Id.

A skull so hard that it is almost as easy to *split* a helmet of iron as to make a fracture in it.

Ray on the Creation.

It states notoriously irreligious, a secret and irresistible power *splits* their counsels, and smites their most refined policies with frustration and a curse.

South

These are the rocks on which the sanguine tribe of lovers daily *split*, and on which the politician, the alchemist, and projector are cast away.

Addison's Spectator.

One and the same ray is by refraction disturbed, shattered, dilated, and *split*, and spread into many diverging rays.

Newton.

This effort is in some earthquakes so vehement that it *splits* and tears the earth, making cracks or chasms in it some miles.

Woodward.

The road that to the lungs this store transmits, Into unnumbered narrow channels *splits*.

He instances Luther's sensuality and disobedience, two crimes which he has dealt with; and, to make the more solemn shew, he *split* 'em into twenty.

Aterbury.

Each had a gravity would make you *split*,
And shook his head at M——y as a wit.

Pope.

Oh! would it please the gods to *split*
Thy beauty, size, and years, and wit,

No age could furnish out a pair
Of nymphs so graceful, wise, and fair;

With half the lustre of your eyes,
With half your wit, your years, and size.

Swift.

The seamen spied a rock, and the wind was so strong that we were driven directly upon it, and immediately *split*.

Id.

How should we rejoice, if, like Judas the first,
Those *splitters* of parsons in sunder should burst.

Id.

Their logick has appeared the mere art of wrangling, and their metaphysics the skill of *splitting* an hair, of distinguishing without a difference.

Watts on the Mind.

SPODUMENE, in mineralogy, prismatic triphane spar.—Mohs. Color between greenish-white and mountain-gray. Massive, disseminated, and in large granular concretions. Glistening, pearly. Cleavage, threefold. Fracture fine grained uneven. Translucent. As hard as felspar. Most easily frangible. Specific gravity 3.0 to 3.1. Before the blowpipe it first separates into small gold yellow colored foha; and, if the heat is continued, they melt into a greenish-white colored glass. Its constituents are, silica 64.4, alumina 24.4, lime 3, potash 5, oxide of iron 2.2. Vauquelin. It was first discovered in the island of Uton in Sudermannland, where it is associated with red felspar and quartz. It has been lately found in the vicinity of Dublin by Dr. Taylor. It contains the new alkali lithia, by some recent analyses.

SPOHN (Frederic Augustus Willham), an eminent German physiologist, was born at Dortmund in 1792, and studied at the university of Wittenberg. His house and part of his library having been destroyed at the bombardment of that place, in 1813, he removed to Leipsic, where he was nominated in 1817 extraordinary professor of philosophy, and in 1819 professor of ancient literature. He died January 16th, 1824, in consequence of disease brought on by his excessive application to study. His literary labors were numerous and important. In 1815 he published a dissertation *De Agro Trojano in Carminibus Homerii Descripto*, 8vo., and *Commentarius de extrema Parte Odysseæ indè à Rhapsod. v. v. 297, Ævo recentiori orta quam Homericæ*; and in the last year of his life he printed three pieces under the title of *Lectiones Theocriteæ*. He left a large quantity of MSS.

SPOIL, *v. a., v. n. & n. s.* } Fr. *spolier*; Lat. *spolium*. To seize
 SPOILER, *n. s.* } *spolio*. To seize
 SPOILFUL, *adj.* } by robbery; take
 away by force: plunder; corrupt; mar: to practise robbery; grow corrupt or useless: as a noun substantive booty; prey; corruption; slough: a spoiler is a robber; plunderer: spoilful, rapaciously wasteful.

They which hate us *spoil* for themselves.

Psalm xlv. 14.

Beware lest any man *spoil* you, through philosophy and vain deceit.

Col. ii. 8.

Ye took joyfully the *spoiling* of your goods, knowing in yourselves that ye have in heaven an enduring substance.

Hebrews.

England was infested with robbers and outlaws, which, lurking in woods, used to break forth to rob and *spoil*.

Spenser.

Yielding themselves upon the Turks' faith, for the safeguard of their liberty and goods, they were most injuriously *spoiled* of all that they had.

Knolles's History of the Turks.

Having oft in battle vanquished

Those *spoilful* Picts, and swarming Easterlings,
 Long time in peace his realm established.

Faerie Queene.

The cry of Talbot serves me for a sword;
 For I have loaden me with many *spoils*,
 Using no other weapon but his name.

Shakspeare. Henry VI.

Company, villanous company, hath been the *spoil* of me.

Shakspeare.

Snakes, the rather for the casting of their *spoil*,
 live till they be old.

Bacon.

Too late, alas! we find

The softness of thy sword, continued through thy soil,

To be the only cause of unrecovered *spoils*.

Such ruin of her manners Rome
 Doth suffer now, as she's become
 Both her own *spoiler* and own prey.

Ben Jonson's Catiline.

Spiritual pride *spoils* many graces.

Taylor.

This mount,

With all his verdure *spoiled*, and trees adrift.

Milton.

Gentle gales,

Fanning their odoriferous wings, dispense
 Native perfumes, and whisper whence they stole
 Those balmy *spoils*.

Id.

Go and speed!

Havock, and *spoil*, and ruin are my gain.

Id.

He that gathered a hundred bushels of acorns or apples had thereby a property in them: he was only to look that he used them before they *spoiled*, else he robbed others.

Locke.

Providence, where it loves a nation, concerns itself to own and assert the interest of religion, by blasting the *spoilers* of religious persons and places.

South.

Thou shalt not gain what I deny to yield,
 Nor reap the harvest, though thou *spoiles*: the field.

Prior.

But grant our hero's hopes long toil
 And comprehensive genius crown,

Each science and each art his *spoil*,

Yet what reward, or what renown?

Bentley.

My sons their old unhappy sire despise,
Spoiled of his kingdom, and deprived of eyes.

Pope.

Women are not only *spoiled* by this education, but we *spoil* that part of the world which would other-

wise furnish most instances of an eminent and exalted piety.

Law.

Came you then here, thus far, through waves, to conquer,

To waste, to plunder, out of mere compassion?

Is it humanity that prompts you on?

Happy for us, and happy for you *spoilers*,

Had your humanity ne'er reached our world!

A. Philips.

The *SPOIL*, among the ancient Greeks, was divided among the whole army; only the general's share was largest; but among the Romans, the spoils belonged to the republic.

SPOKE, *n. s.* Sax. *ƿaca*; Teut. *speiche*; Belg. *spaak*. The bar of a wheel that passes from the nave to the felly.

All you gods,

In general synd take away her power;

Break all the *spokes* and felines of her wheel,

And bowl the round knave down the hill of heaven.

Shakspeare.

No heir e'er drove so fine a coach;

The *spokes*, we are by Ovid told,

Were silver, and the axle gold.

Swift.

SPOLETANI, the ancient inhabitants of Spolegium.

SPOLETIUM, in ancient geography, a city of Italy, in Umbria, which bravely withstood Hannibal, when in Italy. An inscription over the gates still commemorates this defeat of the great Carthaginian. Water was conveyed into the city from an adjacent mountain, by an aqueduct 230 yards above the foundation, relics of which still exist. It is now called Spoleto. See SPOLETO.

SPOLETO, a town of the ecclesiastical state, the capital of a duchy of the same name, situated on a hill near the Mareggia. The streets are extremely steep; and, though the houses are in general well built, there is no edifice either public or private that has any claim to distinction. The cathedral, occupying a commanding situation, presents a front of five Gothic arches, supported by Grecian pillars; but the decorations of the interior display little taste. The castle, situated on a high hill which overlooks the town, is a vast stone building, surrounded by a rampart, and connected with the town by a bridge and aqueduct, thrown over a deep dell, and supported by arches of surprising height; the boldness of their construction has made them be attributed to the Romans. Spoleto is a place of great antiquity, and was in vain attacked by the Carthaginians, after their victory at the lake Thrasymene. Its antiquities are two of the town gates, the ruins of a theatre, and those of a temple. The only manufacture is of hats. Fifteen miles S. S. E. of Foligno, and fifty-five N. N. E. of Rome.

SPOILIA OPIMA, Lat., in Roman antiquity, the richest and best of the spoils, which Romulus first set the example of dedicating to Jupiter. See ROME.

SPOILIATION, in ecclesiastical law, is an injury done by one clerk or incumbent to another, in taking the fruits of his benefice under a pretended title. It is remedied by a decree to account for the profits so taken. This injury, when the jus-

patronatus, or right of advowson, doth not come in debate, is cognizable in the spiritual court; as if a patron first presents A to a benefice, who is instituted and inducted thereto; and then, upon pretence of a vacancy, the same patron presents B to the same living, and he also obtains institution and induction. Now, if A disputes the fact of the vacancy, then that clerk who is kept out of the profits of the living, whichever it be, may sue the other in the spiritual court for spoliatio or taking the profits of his benefice. And it shall there be tried, whether the living were or were not vacant; upon which the validity of the second clerk's pretensions must depend. But if the right of patronage comes at all into dispute, as if one patron presented A, and another patron presented B, there the ecclesiastical court has no cognizance, provided the tithes sued for amount to a fourth part of the value of the living, but may be prohibited at the instance of the patron by the king's writ of indicavit. So also if a clerk, without any color of title, ejects another from his parsonage, this injury must be redressed in the temporal courts; for it depends upon no question determinable by the spiritual law (as plurality of benefices or no plurality, vacancy or no vacancy), but is merely a civil injury.

SPOLTORO, a town of Naples, in Abruzzo Ultra; twelve miles south-east of Teramo.

SPON (Charles), M. D., a learned French physician, son of a merchant, and born at Lyons, in 1609. He showed a peculiar genius for Latin poetry, so early as his fourteenth year. He studied at Ulm; graduated at Montpellier in 1632; and became a member of the college of physicians at Lyons, where he practised with great success. He was made honorary physician to Louis XIV. in 1645. He published the Prognostics of Hippocrates, under the title of Sibylla Medica, in hexameter verse; and some Latin iambics. He maintained a learned correspondence with professor Guy Patin, and their letters were published after his death. He died 21st of February, 1684.

SPON (James), M. D., son of the doctor, was born at Lyons, in 1647. After a liberal education, he graduated at Montpellier in 1667, and joined the Faculty at Lyons in 1669. In 1675 and 1676 he made a voyage to Dalmatia, Greece, and the Levant, of which he wrote a fine account. He published many valuable works; as, 1. *Recherches des Antiquités de Lyon*, 1674, 8vo. 2. *Ignotorum atque obscurorum Deorum Aræ*, 1677, 8vo. 3. *Voyage de la Grece, et du Levant*, 1677, 3 vols. 12mo. 4. *Histoire de la ville, et de l'état de Geneve*, 1680, 2 vols. 12mo. &c. Being a Protestant, he was obliged to leave France, in 1685, on the repeal of the edict of Nantes, and set out for Zurich; but died at Vevey in 1686. He was a member of the academy of the Ricovrati, at Padua.

SPONDEUS. See **SPONDEE**.

SPONDANUS (Joannes), or John De Sponde, a learned Spaniard, born at Maulcon, in Biscay, in 1557. In his twentieth year he began a Commentary on Homer's Iliad and Odyssey, which was printed at Basil, in 1583, in folio, and dedicated to Henry king of Navarre, afterwards

Henry IV. and the Great of France. He also published Aristotle's Logic, Greek and Latin with notes, at Basil, 1583. In 1593 he followed the bad example of the Great Henry, by turning Papist, and published his Reasons; but they surely could not be half so weighty as those of Henry, as the peace of a kingdom did not depend on his abjuration of Protestant principles. He died in Biscay, in 1595.

SPONDANUS, or **SPONDE** (Henry), younger brother of John, was born in 1568, and educated at the College of the Reformers at Ortez, where he made a rapid progress in the languages and the canon and civil law. Henry IV. made him master of requests at Navarre. He also turned Catholic, in 1595. In 1600 he went to Rome, where he took orders, and was promoted by Paul V.; but in 1626 he was recalled to France by Louis XIII. and made bishop of Pamiers. He abridged and continued Baronius's Ecclesiastical Annals, from 1197 to 1640, and published in folio *Annales Sacri Mundi Creatione, ad ejusdem Redemptionem*; with some other works. He died at Thoulouse in 1643.

SPON'DEE, *n. s.* Fr. *spondée*; Lat. *spondeus*. A foot of two long syllables.

We see in the choice of the words the weight of the stone, and the striving to heave it up the mountain: Homer clogs the verse with *spondees*, and leaves the vowels open. *Broome*.

SPONDIAS, Brazilian, or Jamaica plum, in botany, a genus of plants belonging to the class of decandria, and order of pentagynia. The calyx is quinqueedentate. The corolla pentapetalous. The fruit contains a quinquelocular kernel. There are only two species; viz. *S. mombia*, and *myrobalanus*. But they are so much confounded in the description of different botanists that we cannot venture to describe them.

SPON'DYLE, *n. s.* Fr. *spondile*; Lat. *spondylus*; Gr. *σπονδυλος*. A vertebra; a joint of the spine.

It hath for the spine or back-bone a cartilaginous substance, without any *spondyles*, processes, or protuberances. *Browne*.

SPONGE, *n. s., v. a. & v. n.* Lat. *spongia*. **SPON'GER**, *n. s.* } A soft porous substance, supposed by some the nidus of animals. It is remarkable for sucking up water. Too often written sponge: as a verb active to blot; wipe away: as a verb neuter suck in like a sponge: a sponger is a sucker of this kind: spongy and spongiuous, full of cavities like a sponge.

They opened and washed part of their *sponges*. *Sandys*.

Except between the words of translation and the mind of Scripture itself there be contradiction, very little difference should not seem an intolerable blemish necessarily to be *sponged* out. *Hooker*.

When their drenched natures lie as in a death, What cannot you and I perform upon The unguarded Duncan? What not put upon His *spongy* officers, who shall bear the guilt? *Shakespeare*.

Sponges are gathered from the sides of rocks, being as a large but tough mass. *Bacon*.

The lungs are the most *spongy* part of the body, and therefore ablest to contract and dilate itself.

Id. *Natural History.*

The lungs are exposed to receive all the droppings from the brain; a very fit cistern, because of their *sponginess*.

Into earth's *spongy* veins the ocean sinks, Those rivers to replenish which he drinks.

Denham.

The body of the tree being very *spongy* within, though hard without, they easily contrive into canoes.

More.

Return, unhappy swain!

The *spongy* clouds are filled with gathering rain.

Dryden.

Great officers are like *sponges*: they suck till they are full, and, when they come once to be squeezed, their very heart's blood comes away. *L'Estrange.*

The ant lives upon her own, honestly gotten; whereas the fly is an intruder, and a common smell-feast, that *sponges* upon other people's trenchers.

Id.

A generous rich man, that kept a splendid and open table, would try which were friends, and which only trencher-flies and *spongers*.

Id.

Her bones are all very *spongy*, and more remarkably those of a wild bird, which flies much, and long together.

Grew.

All thick bones are hollow or *spongy*, and contain an oleaginous substance in little vesicles, which by the heat of the body is exhaled through these bones to supply their fibres.

Cheyne.

Here went the dean, when he 's to seek,
To *sponge* a breakfast once a week.

Swift.

SPONGES may be bleached by soaking and squeezing them first in cold water for several days, and then in warm water. If they be now washed with cold water, slightly acidulated with sulphuric acid, starch will detect iodine in the liquid which contains hydriodate of potash. The calcareous matter of sponge is best removed by a dilute muriatic acid. After washing in water they are to be put into aqueous sulphuric acid, specific gravity 1.034, and left for eight days, being occasionally squeezed.

SPONGE, in zoology. See **SPONGIA**.

SPONGIA, sponge, in zoology, a genus of animals belonging to the class of vermes, and order of zoophyta. It is fixed, flexible, and very torpid, growing in a variety of forms, composed either of reticulated fibres, or masses of small spines interwoven together, and clothed with a living gelatinous flesh, full of small mouths or holes on its surface, by which it sucks in and throws out the water. So early as the days of Aristotle sponges were supposed to possess animal life; the persons employed in collecting them having observed them shrink when torn from the rocks, thus exhibiting symptoms of sensation. The same opinion prevailed in the time of Pliny. But no attention was paid to the subject till count Marsigli examined them, and declared them vegetables. Dr. Peysonell, in a paper which he sent to the Royal Society in 1752, and in a second in 1757, affirmed they were not vegetables, but the production of animals; and accordingly described the animals, and the process which they performed in making the sponges. Mr. Ellis, in 1762, was at great pains to discover these animals. For this purpose he dissected the sponge *urens*, and was surprised to

find a great number of small worms of the genus of *neris* or sea-scolopendra, which had pierced their way through the soft substance of the sponge in quest of a safe retreat. That this was really the case, he was fully assured, by inspecting a number of specimens of the same sort of sponge, just fresh from the sea. He put them in a glass filled with sea water; and then, instead of seeing any of the little animals which Dr. Peysonell described, he observed the papillæ, or small holes with which the papillæ are surrounded, contract and dilate themselves. He examined another variety of the same species of sponge, and plainly perceived the small tubes inspire and expire the water. He therefore concluded that the sponge is an animal, and that the ends or openings of the branched tubes are the mouths by which it receives its nourishment, and discharges its excrements. Fifty species have already been discovered, of which ten belong to the British coasts.

1. *S. botryoides*, grape sponge, is very tender and branched, as if in bunches; the bunches are hollow, and are made up of oblong oval figures having the appearance of grapes; and each bunch is open at top. The species is of a bright, shining color. The openings at the top are evidently the mouths by which the animal imbibes and discharges moisture. When the surface is very much magnified, it appears covered with little masses of triple, equidistant, shining spines.

2. *S. coronata*, coronet sponge, is very small, consisting of a single tube surrounded at top by a crown of little spines. The tube is open at the top. The rays that compose the little crown are of a bright, shining, pearl color; the body is of a pale yellow. It has been found in the harbour of Emsworth, between Sussex and Hampshire.

3. *S. cristata*, or cock's-comb sponge, is flat, erect and soft, growing in the shape of cocks-combs, with rows of little holes along the tops, which project a little. It abounds on the rocks to the eastward of Hastings in Sussex, where it may be seen at low-water. It is commonly about three inches long, and two inches high, and of a pale yellowish color. When put into a glass vessel of sea water, it has been observed to suck in and squirt out the water through little mouths along the tops, giving evident signs of life.

4. *S. dichotoma*, dichotomous or forked sponge, is stiff, branched, with round, upright, elastic branches, covered with minute hairs. It is found on the coast of Norway, and also, according to Berkenhout, on the Cornish and Yorkshire coasts. It is of a pale yellow color, and full of very minute pores, guarded by minute spines.

5. *S. fluviatilis*, river sponge, is green, erect, brittle, and irregularly disposed in numerous branches. It abounds in many parts of Europe, in the fresh rivers of Russia and England, particularly in the river Thames. It scarcely exhibits any symptoms of life; is of a filthy smell: its pores or mouths are sometimes filled with green gelatinous globules. It differs very little from the *lacustris*.

6. *S. lacustris*, creeping sponge, has erect, cylindrical, and obtuse branches. It is found in lakes in Sweden and England.

7. *S. oculata*, or branched sponge, is delicately soft and very much branched; the branches are a little compressed, grow erect, and often united together. They have rows of cells on each margin that project a little. This species is of a pale yellow color, from five to ten inches high. The fibres are reticulated, and the flesh or gelatinous part is so tender that when it is taken out of the water it soon dries away. It is very common round the sea coast of Britain and Ireland. Along the edges and on the surface of the branches are rows of small papillary holes, through which the animal receives its nourishment.

8. *S. palmata*, palmated sponge, is like a hand with fingers a little divided at the top. The mouths are a little prominent, and irregularly disposed on the surface. It is found on the beach at Brightelmstone. It is of a reddish color, inclining to yellow, and of the same soft woolly texture with the *spongia oculata*.

9. *S. stuposa*, tow sponge or downy branched sponge, is soft like tow, with round branches, and covered with fine pointed hair. It is of a pale yellow color, and about three inches high. It is frequently thrown on the shore at Hastings in Sussex. It is so closely covered with a fine down that the numerous small holes in its surface are not discernible.

10. *S. tomentosa*, or *S. urens*, stinging sponge, or crumb of bread sponge, is of many forms, full of pores, very brittle and soft, and interwoven with very minute spines. It is full of small protuberances, with a hole in each, by which it sucks in and throws out the water. It is very common on the British coast; and is frequently seen surrounding fucuses. It is found also on the shores of North America, Africa, and in the East Indies. When newly taken out of the sea it is of a bright orange color, and full of gelatinous flesh; but when dry it becomes whitish, and when broken has the appearance of crum of bread. If rubbed on the hand it will raise blisters; and if dried in an oven its power of stinging is much increased, especially that variety of it which is found on the sea coast of North America.

SPONSOR, *n. s.* Lat. *sponsor*. A surety; one who makes a promise or gives security for another.

In the baptism of a male there ought to be two males and one woman, and in the baptism of a female child two women and one man; and these are called *sponsors* or sureties for their education in the true christian faith. *Ayliffe's Parergon*.

The *sponsor* ought to be of the same station with the person to whom he becomes surety. *Broome*.

The rash hermit, who with impious pray'r
Had been the *sponsor* of another's care. *Harte*.

SPONTANEOUS, *adj.* } French *spontanée*;
SPONTANEOUSLY, *adv.* } Lat. *sponte*. Volun-
SPONTANEITY, *n. s.* } tary; not compel-
SPONTANEOUSNESS. } led; acting without
compulsion or restraint: the adverb and noun
substantives corresponding.

Necessity and *spontaneity* may sometimes meet together, so may *spontaneity* and liberty; but real necessity and true liberty can never.

Bramhall against Hobbes.

They now came forth
Spontaneous; for within them spirit moved
Attendant on their lord. *Milton*.

Many analogal motions in animals, though I cannot call them voluntary, yet I see them *spontaneous*: I have reason to conclude that these are simply mechanical. *Hale*.

The sagacities and instinct of brutes, the *spontaneousness* of many of their animal motions, are not explicable, without supposing some active determinate power connexed to and inherent in their spirits, of a higher extraction than the bare natural modification of matter. *Hale's Origin of Mankind*.

Strict necessity they simple call;
It so binds the will, that things foreknown
By *spontaneity*, not choice, are done. *Dryden*.

While John for nine-pins does declare,
And Roger loves to pitch the bar,
Both legs and arms *spontaneous* move,
Which was the thing I meant to prove. *Prior*.

This would be as impossible as that the lead of an edifice should naturally and *spontaneously* mount up to the root, while lighter materials employ themselves beneath it. *Bentley*.

Begin with sense, of every art the soul,
Parts answering parts shall slide into a whole;
Spontaneous beauties all around advance,
Start even from difficulty, strike from chance;
Nature shall join you, time shall make it grow. *Pope*.

They turns *spontaneously* acid, and the curd into
cheese as hard as a stone. *Arbutnot on Aliments*.

SPONTANEOUS INFLAMMATION, heat and conflagration produced in combustible bodies, from adventitious causes, without the application of fire. A paper on this subject which appeared in the *Repertory of Arts*, vol. ii. p. 425, induced the Rev. W. Tooke to publish some remarks in vol. iii. p. 95 of that work, from which, as the paper is long, we shall only give an extract, respecting the spontaneous inflammations of animal and vegetable substances. 'One Rûde,' says he, 'an apothecary at Bautzen, had prepared a pyrophorus from rye-bran and alum. Not long after he had made the discovery there broke out in the next village of Nauslitz a great fire, which did much mischief, and was said to have been occasioned by the treating of a sick cow in the cow-house. Mr. Rûde knew that the countrymen were used to lay an application of parched rye-bran to their cattle for curing the thick neck; he knew also that alum and rye-bran, by a proper process, yielded a pyrophorus; and now to try whether parched rye-bran alone would have the same effect he roasted a quantity of rye-bran by the fire till it had acquired the color of roasted coffee. This roasted bran he wrapped up in a linen cloth; in a few minutes there arose a strong smoke with a smell of burning. Soon after the rag grew as black as tinder, and the bran, now become hot, fell through it on the ground in little balls. Mr. Rûde repeated the experiment, and always with the same result. Who now will doubt that the frequency of fires in cow-houses, which in those parts are mostly wooden buildings, is occasioned by this practice, of binding roasted bran about the necks of the cattle? Montet relates, in the *Memoires de l'Académie de Paris*, 1748, that animal substances kindle into flame; and that he himself has been witness to the spontaneous accension of dunghills.

The woollen stuff prepared at Sevennes, named emperor's stuff, has kindled of itself, and burnt to a coal. It is not unusual for this to happen to woollen stuffs, when in hot summers they are laid in a heap, in a room but little aired. In June 1781 this happened at a wool-comber's in Germany, where a heap of wool-combing, piled up in a close warehouse seldom aired, took fire of itself. This wool burnt from within outwards, and became quite a coal; though neither fire nor light had been used at the packing. In like manner cloth-workers have certified that, after they have bought wool that was become wet, and packed it close in their warehouse, this wool has burnt of itself. The spontaneous accension of various matters from the vegetable kingdom, as wet lay, corn, and madder, and at times wet meal and malt, are well known. Hemp, flax, and hemp-oil, have also often given rise to dreadful conflagrations. In spring 1780 a fire was discovered on board a frigate lying in the road off Cronstadt, which endangered the whole fleet. After the severest scrutiny, no cause of the fire was to be found; and the matter remained without explanation, but with strong surmises of some wicked incendiary. In August 1780 a fire broke out at the hemp-magazine at St. Petersburg, by which several hundred thousand poods (about thirty-six pounds English) of hemp and flax were consumed. The walls of the magazine are of brick, the floors of stone, and the rafters and covering of iron; it stands alone on an island in the Neva, on which, as well as on board the ships lying in the Neva, no fire is permitted. In St. Petersburg, in the same year, a fire was discovered in the vaulted shop of a furrier. In these shops, which are all vaults, neither fire nor candle is allowed, and the doors of them are all of iron. At length the probable cause was found to be that the furrier, the evening before the fire, had got a roll of new cere-cloth, and had left it in his vault, where it was found almost consumed. In the night between the 20th and 21st of April, 1781, a fire was seen on board the frigate Maria, at anchor, with several other ships, in the roads off the island of Cronstadt; the fire was however soon extinguished; and, by the severest examination, nothing could be extorted concerning the manner in which it had arisen. The garrison was threatened with a scrutiny that should cost them dear; and, while they were in this cruel suspense, the wisdom of the sovereign gave a turn to the affair, which quieted the minds of all, by pointing out the proper method to be pursued by the commissioners of enquiry, in the following order to Czernichef:—When we perceived, by the report you have delivered in of the examination into the accident that happened on board the frigate Maria, that, in the cabin where the fire broke out, there were found parcels of matting tied together with packthread, in which the soot of burnt fir-wood had been mixed with oil, for the purpose of painting the ship's bottom, it came into our mind, that at the fire which happened last year at the hemp-warehouses, the following cause was assigned, that the fire might have proceeded from the hemp being bound up in greasy mats, or even from such mats having lain near the hemp: therefore neglect not

to guide your further enquiries by this remark. As, upon juridical examination, as well as private enquiry, it was found that, in the ship's cabin, where the smoke appeared, there lay a bundle of matting containing Russian lamp-black, prepared from fir-soot, moistened with hemp-oil varnish, which was perceived to have sparks of fire in it at the time of the extinction, the Russian admiralty gave orders to make various experiments, to see whether a mixture of hemp-oil varnish and the fore-mentioned Russian black, folded up in a mat and bound together, would kindle of itself. They shook forty pounds of fir-wood soot into a tub, and poured about thirty-five pounds of hemp-oil varnish upon it; this they let stand for an hour, after which they poured off the oil. The remaining mixture they now wrapped up in a mat, and the bundle was laid close to the cabin where the midship-men had their birth. Two officers sealed both the mat and the door with their own seals, and stationed a watch of four officers to take notice of all that passed the whole night through; and, as soon as any smoke should appear, immediately to give information to the commandant of the port. The experiment was made the 26th of April, about 11 o'clock A. M., in presence of all the officers. Early on the 27th, about 6 o'clock A. M., a smoke appeared, of which the chief commandant was immediately informed: he came with speed, and through a small hole in the door saw the mat smoking. He despatched a messenger to the members of the commission; but as the smoke became stronger, and fire began to appear, he found it necessary to break the seals and open the door. No sooner was the air thus admitted than the mat began to burn with greater force, and presently it burst into a flame. The Russian admiralty, being now fully convinced of the self-encinding property of this composition, transmitted their experiment to the Imperial Academy of Sciences; who appointed Mr. Georgi, a very learned adjunct of the academy, to make farther experiments on the subject. Three pounds of Russian fir-black were slowly impregnated with five pounds of hemp-oil varnish; and, when the mixture stood open five hours, it was bound up in linen. By this process it became clotted; but some of the black remained dry. When the bundle had lain sixteen hours in a chest it was observed to emit a very nauseous, and rather putrid smell, not unlike that of boiling oil. Some parts of it became warm, and steamed much; eighteen hours after the mixture was wrapped up, one place became brown, emitted smoke, and directly afterwards glowing fire appeared. The same thing happened in a second and third place; though other places were scarcely warm. The fire crept slowly around, and gave a thick, gray, stinking smoke. Mr. Georgi took the bundle out of the chest, and laid it on a stone pavement; when, on being exposed to the free air, there arose a slow burning flame a span high, with a strong body of smoke. Not long afterwards there appeared, here and there, several chaps or clefts, as from a little volcano, the vapor issuing from which burst into flames. On his breaking the lump it burst into a very violent flame full three feet high, which soon grew less, and then went out. The smoking

and glowing fire lasted six hours; and the remainder continued to glow without smoke for two hours longer. The gray earthy ashes, when cold, weighed five ounces and a half. Mr. Tooke concludes with a case of self-accension, noticed by Mr. Hageman, an apothecary at Bremen. He prepared a boiled oil of hyoscyamus, or henbane, in the usual way with common oil. The humidity of the herb was nearly evaporated, when he was called away by other affairs, and was obliged to leave the oil on the fire. The evaporation of the humidity was hereby carried so far that the herb could easily be rubbed to powder. The oil had lost its green color, and had become brownish. In this state it was laid on the straining cloth, and placed in the garden, behind the house, in the open air. In half an hour, on coming again to this place, he perceived a strong smoke there, though he thought the oil must have long been cooled: on closer inspection he found that the smoke did not proceed from the oil, but from the herb on the straining cloth; at the same time the smell betrayed a concealed fire. He stirred the herb about, and blew into it with a bellows, whereupon it broke out into a bright flame.

SPOOM, *v. n.* Probably from spume, or foam, as a ship driven with violence spumes, or raises a foam. To go on swiftly. A sea term.

When virtue *spooms* before a prosperous gale,
My heaving wishes help to fill the sail. *Dryden.*

SPOON, *n. s.* Belg. *spaen*; Dan. *spone*;
SPOONBILL, } Isl. and Goth. *spoonn*. A
SPOONFUL, } concave vessel with a han-
SPOONMEAT. } dle, used in eating liquids:
spoonbill is a bird with a bill of this shape: a spoonful is the quantity a spoon will hold: spoonmeat, food taken with a spoon.

Wouldst thou-drown thyself,
Put but a little water in a *spoon*,
And it shall be as all the ocean,
Enough to stifle such a villain up.

Shakspeare. King John.

Prescribe him, before he do use the receipt, that he take such a pill, or a *spoonful* of liquor. *Bacon.*
Diet most upon *spoonmeats*, as veal or cock broths.

Harvey.

The shoveller, or *spoonbill*; the former name the more proper, the end of the bill being broad like a shovel, but not concave like a spoon, but perfectly flat. *Grew's Muscum.*

Wretched

Are mortals born to sleep their lives away!
Go back to what thy fancy began,
Eat pap and *spoonmeat*; for thy gurgaws cry,
Be sullen, and refuse the lullaby. *Dryden's Persius.*

Surely the choice and measure of the materials of which the whole body is composed, and what we take daily by pounds, is at least of as much importance as of what we take seldom, and only by grains and *spoonfuls*. *Arbutnot.*

We prescribed a slender diet, allowing only *spoonmeats*. *Wiseman.*

Ducks and geese have such long broad bills to quaffer in water and mud; to which we may reckon the bill of the *spoonbill*. *Derham's Physico-Theology.*

Or o'er cold coffee trifle with the *spoon*,
Count the slow clock, and dine exact at noon.

Pope.

SPOONING, in the sea-language, is said of a ship, which being under sail in a storm at sea

is unable to bear it, and consequently forced to go right before the wind.

SPOONWORT. See **COCHLEARIA**.

SPORADES, among ancient philosophers, a name given to such stars as were not included in any constellation.

SPORADES; the general name for nineteen islands in the Archipelago, lying to the east of the Cyclades. The principal are Scio, or Clios, Samos, Rhodes, and Lesbos. Patmos, or Pathmos, a small rocky island of the Sporades, is celebrated as the place of St. John's exile. The grotto in which he is said to have written the *Apocalypse* is still shown, and a monastery, called the *monastery of the Apocalypse*, has been erected in commemoration of the event. The name *Sporades* is derived from the Greek *σπειρειν*, to sow, indicating the scattered position of the islands: hence the medical phrase *sporadic diseases*, in opposition to *epidemic*, signifying those which seize a few persons at any time or season.

SPORADICAL, *adj.* Fr. *sporadique*; Gr. *παραδικός*. Defined in the extract.

SPORADICAL DISEASES, among physicians, are such as seize particular persons at any time or reason, and in any place; in which sense they are distinguished from epidemical and endemical diseases.

SPORT, *n. s., v. a., v. n.* } Ital. *sporto*; Isl.
SPORTFUL, *adj.* } *spotto*, of barb. Lat.
SPORTFULNESS, *n. s.* } *desporto*, to relax.
SPORTIVE, *adj.* } Play; frolic; that
SPORTIVENESS, *n. s.* } with which one
SPORTSMAN. } plays; diversion of
the field in particular: to sport is, divert; make merry; to game; frolic; wanton; trifle; use field diversions: sportful, merry; wanton; artful: the noun substantive corresponding: sportive, gay; playful; light-hearted: the noun substantive corresponding: a sportsman, one who pursues field-sports.

SPORTS. The national amusements and pastimes of a people form an important feature in the national character. Taking their tone from the manners, habits, and condition of the age or country in which they prevail, they lead us behind the scene on which the great drama of public life is exhibited, to the daily and familiar customs and events of popular life. The sports of a nation are of a religious or martial spirit, gay and mild, or dark and fierce, rude or refined, bodily or intellectual, as they are tinged by its habits and character, on which they reciprocally exercise a powerful influence. Besides numerous local holidays and sports, such as the harvest-home, in honour of Ceres and Bacchus, the panthenæa, celebrated in honour of Minerva, by all the people of Attica, &c., there were four great national festivals among the Greeks, open to all people of the Grecian name. The Olympic, Pythian, Nemæan, and Isthmian games (see the articles), were great public festivals, which inspired that polished people with a love of the arts, and imbued them with the spirit of social life. In these games, which were at once religious festivals and commercial fairs, the gymnastic and musical contests were exhibited in union; and

the productions of genius, poems, and histories, were rehearsed before all that was choice and learned of Greece, surrounded by the masterpieces of statuary, painting, and architecture. The public amusements of the Romans were of a fierce and sanguinary, or of a course and rude character. Their triumphs, their gladiatorial fights, their combats of wild beasts, their religious festivities, which were scenes of boisterous revelry, showed how much behind the Greeks they were in refinement and taste. In the middle ages, religion and war were the chief elements of the social life, and the amusements were chiefly of a religious or military character. Many of the modern popular sports originated from religious festivals: such are morris-dances, theatrical shows (see *Mysteries*, and *Moralities*), &c. Bull-fights continue to form the national amusement of the Spaniards, though the baiting of beasts has nearly gone out of use in England. Cock-fighting, horse-racing, and boxing, national dances, and the field sports of hunting, hawking, or archery, are the favourite amusements of some people. But, in some countries, the progress of industry, the habits of domestic life, and the general diffusion of books, have, in a great measure, superseded the pastimes which were formerly so universal. Among the amusements of most nations, games of chance hold an important place, and are, undoubtedly, of very ancient origin. Those, in which the fingers are the instruments, as in the Italian *mora*, are probably the oldest. The invention of dice is attributed to the Greek Palamedes; that of chess, to the people of India. Both games were known to the Greeks and Romans. The games of mixed chance and skill are also of early origin. These were known to the Romans; but they were principally attached to games of chance (*alea*), although they were prohibited by law, and the players reputed infamous. The ancient Germans, according to the description of Tacitus, were passionately devoted to gaming. "They addict themselves," says he, "to dice when sober, and as a serious employment, with such a mad desire of winning or losing, that, when stript of every thing else, they will at last stake their liberty and their very selves. The loser suffers himself to be bound and sold." Cards are of modern invention; and the games at cards are, some of them, purely games of chance, others of chance and skill combined. The laws of some countries, as of England, and many of the U. States, prohibit gaming: those of France, and some other countries of Europe, license gaming houses. Henry VIII. of England issued a proclamation against unlawful games, in consequence of which, dice, cards, tables, and bowls, were seized and destroyed in many places, though he himself was a great gambler; and we read of his losing much of the plunder of the suppressed abbeys at games of chance. Suspected gamblers, in England, may be brought before magistrates, and required to find sureties not to play or bet during twelve months, to the amount of twenty shillings, and, in default of sureties, may be imprisoned.

SPOT, *n. s. & v. a.* } Dan. *spette*: Flemish
SPOTLESS, *adj.* } *spotte*. A blot; a mark
SPOTTY. } made by discoloration,
a taint; disgrace: hence a marked or particular
place: 'upon the spot' is immediately; without
changing place: to spot, to stain; discolour;
corrupt: spotless, free from spot or stain: spotty,
abounding in spots.

This vow receive, this vow of God maintain,
My virgin life no spotted thoughts shall stain.

Sidney.

Let him take thee,
And hoist thee up to the shonting plebeians;
Follow his chariot, like the greatest spot
Of all thy sex. *Shakspeare. Antony and Cleopatra.*

Have you not seen a handkerchief,
Spotted with strawberries, in your wife's hand?

Shakspeare.

So much fairer
And spotless shall mine innocence arise,
When the king knows my truth. *Id.*

That spot to which I point is Paradise,
Adam's abode; those lofty shades, his bower.

Milton.

This three years day, these eyes, though clear
To outward view of blemish or of spot,
Bereft of sight, their seeing have forgot. *Id.*

The moon, whose orb
Through optick glass the Tuscan artist views
In Valombrosa to desry new lands,
Rivers, or mountains, on her spotty globe. *Id.*

I would be busy in the world, and learn;
Not, like a coarse and useless dunghill weed,
Fixed to one spot, and rot just as I grow. *Otway.*

As in this grove I took my last farewell,
As on this very spot of earth I fell,
So she my prey becomes even here. *Dryden.*

He who, with Plato, shall place beatitude in the
knowledge of God, will have his thoughts raised to
other contemplations than those who looked not be-
yond this spot of earth, and those perishing things in
it. *Locke.*

I counted the patches on both sides, and found the
tory patches to be about twenty stronger than the
whig: but next morning the whole puppetshow was
filled with faces spotted after the whiggish manner.
Addison's Spectator.

Yet Chloe sure was formed without a spot;
'Tis true, but something in her was forgot. *Pope.*

Here Adrian fell: upon that fatal spot
Our brother died. *Granville.*

You graed the several parts of life,
A spotless virgin, and a faultless wife. *Waller.*

But serpents now more amity maintain;
From spotted skins the leopard does refrain;
No weaker lions by a stronger slain.

Tate's Juvenal.

Eternal sunshine of the spotless mind,
Each prayer accepted, and each wish resigned.

Pope.

It was determined upon the spot, according a: the
oratory on either side prevailed. *Swift.*

The Dutch landscapes are, I think, always a re-
presentation of an individual spot, and each in its
kind a very faithful, but very confined portrait.

Reynolds.

SPOTS, in astronomy, certain places of the sun's or moon's disk, observed to be either more bright or dark than the rest, and accordingly called *feculæ et maculæ*. See ASTRONOMY, Index.

SPOTSWOOD (John), archbishop of St. Andrew's in Scotland, was descended from the lairds of Spotswood in the Merse, and was born in 1565. He was educated in the university of Glasgow, and succeeded his father in the parsonage of Calder when but eighteen years of age. In 1601 he attended Lodowick, duke of Lennox, as chaplain, in an embassy to the court of France for confirming the ancient amity between the two nations, and returned in his retinue through England. When he entered into the archbishopric of Glasgow, there was not £100 sterling of yearly revenue left; but by economy he greatly improved it. In 1616 he was made archbishop, primate, and metropolitan of Scotland. He presided in several assemblies for restoring the ancient discipline, and bringing the church of Scotland to uniformity with that of England. He continued in high esteem with king James I. and Charles I. who was crowned by him in 1633 at Holyroodhouse. In 1635, upon the death of the earl of Kinnoul, chancellor of Scotland, he was advanced to that post; but had scarcely held it four years, when the confusions beginning in Scotland, he was obliged to retire into England; and died at London in 1639, and was interred in Westminster Abbey. He wrote a history of the Church of Scotland from 203 to the reign of king James VI. in folio.

SPOUSAL, *adj. & n. s.* } Fr. *épouse*; Lat. }
 SPOUSE, *n. s.* } *sponsa, sponsus*. Nup- }
 SPOUSED, *adj.* } tial; matrimonial: }
 marriage; nuptials; one joined in marriage: a husband or wife: wedded; joined in matrimony.

As man and wife, being two, are one in love,
 So be there 'twixt your kingdoms such a *sposal*,
 That never may ill office, or fell jealousy,
 Thrust in between the paction of these kingdoms,
 To make divorce of their incorporate league.

Shakespeare.

She is of good esteem;
 Beside, so qualified as may beseem
 The *spouse* of any noble gentleman. *Id.*

There shall we consummate our *sposal* rites. *Id.*

They led the vine
 To wed her elm; she *sposued* about him twines
 Her marriageable arms. *Milton.*

This other, in her prime of love,
Sposal embraces vitiated with gold. *Id.*

The amorous bird of night
 Sung *sposal*, and bid haste the evening star,
 On his hill top to light the bridal lamp. *Id.*

The *sposals* of Hippolita the queen,
 What tilts and tourneys at the feasts were seen!

Dryden.

At once, Farewel, O faithful *spouse!* they said;
 At once the encroaching rinds their closing lips in-
 vade. *Id.*

To tempt the *spouseless* queen with am'rous wiles,
 Resort the nobles from the neighb'ring isles. *Pope.*

Sleepest thou, careless of the nuptial day?
 Thy *sposal* ornament neglected lies;
 Arise, prepare the bridal train, arise.

Pope's *Odyssey*.

One of two must still obey,

Nancy, Nancy;
 Is it man or woman, say,
 My *spouse*, Nancy?

Burns.

SPOUT, *n. s., v. a. & v. n.* } Belg *spuyt*. A }
 SPOUTER, *n. s.* } pipe, or mouth of }
 a pipe or vessel, out of which any thing is }
 poured; water falling as from a spout; to pour }
 or issue with violence: a spouter is an everlast- }
 ing or vehement speaker.

They laid them down hard by the murmuring
 musick of certain waters, which *spouted* out of the
 side of the hills. *Sidney.*

Not the dreadful *spout*,
 Which shipmen do the hurricano call,
 Constringed in mass by the almighty sun,
 Shall dizzy with more clamour Neptune's ear
 In his descent, than shall my prompted sword
 Falling on Diomedes.

Shakespeare. *Troilus and Cressida*.

She gasping to begin some speech, her eyes
 Became two *spouts*. *Id.* *Winter's Tale*.

We will bear home that lusty blood again,
 Which here we came to *spout* against your town.

Shakespeare.

In Gaza they couch vessels of earth in their walls,
 to gather the wind from the top, and to pass it down
 in *spouts* into rooms. *Bacon.*

I intend two fountains, the one that sprinkleth
 or *spouteth* water, the other a fair receipt of water.

Id.

As waters did in storms, nov pitch runs out,
 As lead, when a fired church becomes one *spout*.

Donne.

If you chance it to lack,

Be it claret or sack,

I'll make this snout

To deal it about,

Or this to run out,

As it were from a *spout*. *Ben Jonson.*

Next on his belly floats the mighty whale;
 He twists his back, and rears his threatening tail:
 He *spouts* the tide. *Creech.*

In whales that breathe, lest the water should get
 unto the lungs, an ejection thereof is contrived by
 a fistula or *spout* at the head. *Browne.*

She swim' in blood, and blood does *spouting*
 throw

To heaven, that heaven men's cruelties might know.
Waller.

No hands could force it thence, so fixt it stood,
 Till out it rushed, expelled by streams of *spouting*
 blood. *Dryden.*

The force of these motions pressing more in some
 places than in others, there would fall not showers,
 but great *spouts* or cascades of water.

Burnet's *Theory of the Earth*.

In this single cathedral, the very spouts are loaded
 with ornaments. *Addison on Italy*.

It *spouts* up out of deep wells, and flies forth at
 the tops of them, upon the face of the ground.

Woodward

From silver *spouts* the grateful liquors glide,
 And China's earth receives the smoking tide. *Pope.*

All the glittering hill
 Is bright with *spouting* rills. *Thomson's Autumn*.

Elihu Palmer, the deistical *spouter*, was, in the
 small circle of his church, more priestly, more fulmi-
 nating, and looked for more reverence and adoration
 from his disciples, than the Lauds and Gardiners of
 England. Without the means, he affected all the
 haughtiness of Wolsey. Professing to adore reason,
 he was in a rage if any body reasoned with him.

Cheetham's *Life of Raine*

SPRAG, *adj.* Swed. *spraeg*. Vigorous; sprightly. A provincial word.

A good *sprag* memory. *Shakspeare. Merry Wives.*

SPRAIN, *v. a. & n. s.* Corrupted from strain To stretch the ligaments of a joint without dislocation of the bone: the injury that ensues.

I was in pain, and thought it was with some *sprain* at tennis. *Temple.*

Should the big last extend the shoe too wide,
The sudden turn may stretch the swelling vein,
Thy cracking joint unhinge, or ancle *sprain*. *Gay.*

SPRANGHER (Bartholomew), a celebrated painter, born at Antwerp in 1546. He went to Rome, where cardinal Farnese patronised him, and introduced him to pope Pius V., for whom he painted many pictures. On his return he became chief painter to Maximilian II., whose successor Rodolphus was so pleased with him, that he gave him a gold chain and medal, ennobled him and his family, lodged him in his palace, and gave him a pension. He made the tour of the Netherlands, returned to Prague, and died in 1623.

SPRAT, *n. s.* Dut. *sprot*; Lat. *sarda*. A small sea fish.

All-saints do lay for porke and sowse,
For *sprats* and spurlings for their house. *Tusser.*

So oft, in feasts with costly changes clad,
To crammed maws a *sprat* new stomach brings.

Of round fish there are brit, *sprat*, barn, smelts. *Sidney.*
Carew.

SPRAT (Dr. Thomas), bishop of Rochester, was born in 1636. He had his education at Oxford, and became F. R. S., chaplain to George, duke of Buckingham, and chaplain in ordinary to king Charles II. In 1667 he published the History of the Royal Society, and a Life of Mr. Cowley; who, by his last will, left to his care his printed works and MSS., which were accordingly published by him. In 1668 he was appointed prebendary of Westminster, in 1680 canon of Windsor, in 1683 dean of Westminster, and in 1684 bishop of Rochester. He was clerk of the closet to king James II.; in 1685 was made dean of the chapel royal; and in 1686 was appointed one of the commissioners for ecclesiastical affairs. In 1692 his lordship, with several other persons, was charged with treason by two men, who drew up an association, in which the subscribers declared their resolution to restore king James, to seize the princess of Orange, and to be ready with 30,000 men to meet king James when he should land. To this they put the names of Sancroft, Sprat, Marlborough, Salisbury, and others. The bishop was arrested, and kept at a messenger's, under a strict guard, for eleven days. His house was searched and his papers seized, among which nothing was found of a treasonable appearance, except one memorandum in the following words:—Thorough-paced doctrine. This, he said, was only a memorandum of an absurd expression of Daniel Burgess, a preacher. His innocence being proved he was set at liberty, when he published An Account of his Examination and Deliverance; which he commemorated through life by an annual thanksgiving. He died May 20th, 1713, aged seventy-nine. His works, besides the above

and a few poems, are The Answer to Sorbiere; The History of the Rye-house Plot; and a volume of Sermons. Dr. Johnson says that each work 'has its distinct and characteristic excellence.'

SPRATT, in agriculture, a name given in some places to a plant, which is found to rise in great abundance, in a spontaneous manner, in most watery situations of the more sound boggy kind. It is stated, in a paper in the third volume of the Transactions of the Highland Society of Scotland, that, though it abounds much in that part of the kingdom, the proper culture of it is by no means well understood. It should, it is said, be suitably manured for with compost manure, once in three years; or watering sometimes answers the same intention very well, in cases where it is grown for hay; the land being preserved from cattle, or other sorts of stock, from the month of March; and the plants cut for hay in July at the latest. The seeding stalks are also stated to have been mown, after the cattle in pasturage, to benefit. Spring frosts occasionally, however, destroy some inches of the tops.

Sheep may eat it safely without danger of rotting; and it raises young cattle, it is said, to a great size of bone. But that, when suffered to run up to seed, it is not palatable; though cattle not unfrequently get it for hay in that state. Where manure is used, and it is cut in the sap, it constitutes, it is observed, a most excellent and abundant kind of hay for black cattle. In this management it has been seen ready for the scythe as soon as rye-grass; and one of the best samples of meadow hay seen in the above part of the country was cut in the year 1804, and consisted of spratt and common poa. Others, however, do not think so highly of it, as it has been noticed in situations in the Highlands where cattle were often stinted or straitened for food, and generally remained untouched by them. The same has likewise been the case in other places of the above districts.

Its strong root is also thought an objection to its being cultivated as a grass crop, even if it were capable of it, as being difficult of extirpation. It has been farther used for making cushions, to be put under the yokes used by oxen in ploughing; for which purpose it seems, it is said, well suited on account of its toughness:

SPRAWL, *v. n.* Dan. *sprille*. To struggle, as in convulsions; with arms and legs spread.

Hang the child, that he may see it *sprawl*;
A sight to vex the father's soul. *Shakspeare.*

Some lie *sprawling* on the ground,
With many a gash and bloody wound. *Hudibras.*

Telamon hap'd to meet
A rising root that held his fastened feet;
So down he fell, whom *sprawling* on the ground
His brother from the wooden gyves unbound.

Dryden.
The birds were not fledged; but, upon *sprawling*
and struggling to get clear of the flame, down they tumbled. *L' Etrange.*

Hence, long before the child can crawl,
He learns to kick, and wince, and *sprawl*. *Prior.*

Did the stars do this feat once only, which gave
beginning to human race? who were there then in the
world, to observe the births of those first men, and
calculate their natiivities, as they *sprawled* out of
ditches? *Bentley*

He ran, he leapt into a flood,
There *sprawled* awhile, and scarce got out,
All covered over with slime. *Swift.*

SPRAY, n. s. Of the same race with **SPRIT** and **SPROUT**, which see. The extremity of a branch; foam of the sea.

At sight whereof each bird that sits on *spray*,
And every beast that to his den was fled,
Come forth afresh out of their late dismay,
And to the light lift up their drooping head.

Hubberd's Tale.
Thus droops this lofty pine, and hangs his *sprays*,
Thus Eleanor's pride dies in her younger days.

Shakspeare.
The wind that whistles through the *sprays*
Maintains the concert of the song;
And hidden birds with native lays,
The golden sleep prolong. *Dryden.*

Winds raise some of the salt with the *spray*. *Arbutnot.*

SPRAY, the sprinkling of the sea, which is driven from the top of a wave in stormy weather. It differs from spoon-drift, as being only blown occasionally from the broken surface of a high wave; whereas the latter continues to fly horizontally along the sea, without intermission, during the excess of a tempest or hurricane.

SPREAD, v. a., v. n., & c. Saxon *ƿræban*; **SPREADER, n. s.** [*n. s.*] Belg. *spreyden*. To extend; expand; stretch: expand itself: extent; compass: spreader, one who spreads.

He bought a field where he had *spreed* his tent. *Genesis xxxiii.*

Rizpah *spread* sackcloth for her upon the rock. *2 Samuel xxi.*

He arose from kneeling, with his hands *spread* up to heaven, and he blessed the congregation. *1 Kings viii. 54.*

Can any understand the *spreadings* of the cloads, or the noise of his tabernacle? *Job xxxvi. 29.*

The workman melteth a graven image, and the goldsmith *spreadeth* it over with gold. *Isaiah xl. 19.*
Silver *spread* into plates is brought from Tarshish. *Jeremiah x.*

They, when departed *spread* abroad his fame in all that country. *Matthew ix. 31.*

By conforming ourselves we should be *spreaders* of a worse infection than any we are likely to draw from papists, by our conformity with them in ceremonies. *Hooker.*

Spread o'er the silver waves thy golden hair. *Shakspeare.*

Make the trees more tall, more *spread*, and more hasty than they use to be. *Bacon's Natural History.*

Plants, if they *spread* much, are seldom tall. *Bacon.*

No flower hath that *spread* of the woodbind. *Id.*

Faire attendants then
The sheets and bedding of the man of men,
Within a cabin of the hollow keele
Spread and made soft. *Chapman.*

The stately trees fast *spread* their branches. *Milton.*

Great Pan, who wont to chase the fair,
And loved the *spreading* oak, was there. *Addison's Cato.*

I have got a fine *spread* of improveable lands, and am already ploughing up some, fencing others. *Addison.*

Her cheeks their freshness lose and wonted grace,
And an unusual paleness *spreads* her face. *Granville.*

Deep in a rich alcove the prince was laid,
Fast by his side Pisistatus lay *spread*,
In age his equal, on a splendid bed. *Pope.*

If it be a mistake, I desire I may not be accus'd for a *spreader* of false news. *Swift.*

Shall funeral eloquence her colours *spread*,
And scatter roses on the wealthy dead? *Young.*

SPRENT, part. Sax. *ƿrpenngan, ƿrpenan*; Belg. *sprengen*. The old English word for sprinkle is *sprene*. Sprinkled. Obsolete.

O lips, that kissed that hand with my tears *sprent*. *Sidney*

SPRETZA, a river of Bosnia.
SPRIG, n. s. Saxon *ƿrpec*; Welsh *ysbrig*; so Davies: but it is probably of the same race with *sprung*.—Johnson. A small branch; a spray.

The substance is true ivy; after it is taken down, the friends of the family are desirous to have some *sprig* to keep. *Bacon.*

Our chilling climate hardly bears
A *sprig* of bays in fifty years;
While every fool his claim alleges,
As if it grew in common hedges. *Swift.*

SPRIG, in botany. See **BOTANY**, Index, **BRANCH**, **CLION**, **GRAFTING**, and **PLANT**.

SPRIGHT, n. s. & v. a. Sax. *ƿrpreot*. A **SPRIGHTFUL, adj.** contraction of Lat. **SPRIGHTFULLY, adv.** *spiritus*, spirit. It **SPRIGHTLESS, adj.** was anciently written **SPRIGHTLINESS, n. s.** ten *sprete* or *spryte*. **SPRIGHTLY, adv.** Spirit; shade; soul;

incorporeal agent: hence power; animation; courage; an arrow (obsolete): to *spright* is to haunt as a *spright*: *sprightful* is, lively; animated; brisk: the adverb corresponding: *sprightless*, the opposite adjective, with the noun substantive corresponding: *sprightly* is also brisk; lively; vigorous.

O chastity! the chief of heavenly lights,
Which makest us most immortal shape to wear,
Hold thou my heart, establish thou my *sprights*;
To only thee my constant course I bear,
Till spotless soul unto my bosom fly;
Such life to lead, such death I vow to die. *Sidney.*

She doth display
The gate with pearls and rubies richly dight,
Through which her words so wise do make their way,

To bear the message of her *spright*. *Spenser.*

The Grecians *sprightfully* drew from the darts the course,

And heurst it, bearing it to fleet. *Chapman's Iliad.*

You have not seen young heifers, highly kept,
Filled full of daisies at the field, and driven
Home to their hovels; all so *sprightly* given,
That no roome can containe them. *Chapman*

I am *sprighted* with a fool. *Shakspeare. Cymbeline*

The spirit of the time shall teach me speed.
—Spoke like a *sprightful* noble gentleman. *Shakspeare.*

Norfolk, *sprightfully* and bold,
Stays but the summons of the appellants trumpet. *Id.*

We had in use for sea fight short arrows called *sprights*, without any other heads save wood sharpened; which were discharged out of muskets, and would pierce through the sides of ships where a bullet would not. *Bacon's Natural History.*

Are you grown
Benumbed with fear, or virtue's *sprightless* cold?

Cowley.

Steeds *sprightful* as the light. *Id.*

Happy my eyes when they behold thy face :
My heavy heart will leave its doleful beating
At sight of thee, and bound with *sprightful* joys.

Otway.

While with heavenly charity she spoke,
A streaming blaze the silent shadows broke ;
The birds obscene to forests winged their flight,
And gaping graves received the guilty *spright*.

Dryden.

Produce the wine that makes us bold,
And *sprightly* wit and love inspires. *Id.*

The ideas of goblins and *sprights* have no more to
do with darkness than light ; yet let but a foolish
maid inculcate these often on the mind of a child,
possibly he shall never be able to separate them
again. *Locke.*

The soul is clogged when she acts in conjunction
with a companion so heavy ; but, in dreams, observe
with what a *sprightliness* and alacrity does she exert
herself. *Addison.*

Each morn they waked me with a *sprightly* lay :
Of opening heaven they sung, and gladsome day.

Prior.

Of these am I who thy protection claim ;
A watchful *sprite*, and Ariel is my name. *Pope.*

The *sprightly* Sylvia trips along the green ;
She runs, but hopes she does not run unseen. *Id.*

The *sprites* of fiery termagants in flame
Mount up, and take a salamander's name. *Id.*

Youth has a *sprightliness* and fire to boast,
That in the valley of decline are lost,
And Virtue with peculiar charms appears,
Crowned with the garland of life's blooming years.

Cowper.

If there be *sprites*,
They would have walked there in their *spriteliest*
trim,

By way of change from their sepulchral rites,
And show themselves as ghosts of better taste
Than hunting some old Ruin or wild Waste.

Byron.

SPRING, *v. n., v. a. & n. s.* } Sax. *springan* ;
SPRINGE, *n. s.* } Teut. *springe* ;
SPRING'HALT, } Belg. and Swed.
SPRING'INESS, } *springen* ; Goth.
SPRING'LE, } and Swed. *springá*.
SPRING'TIDE, } To shoot ; grow ;
SPRING'GY, *adj.* } arise out of the
ground ; begin to grow ; proceed ; arise ; appear ;
issue ; bound ; leap ; fly with elastic power : as a
verb active, to start ; rouse game ; produce unex-
pectedly ; discharge ; leap or pass by leaping : as
a noun substantive, the season of growth ; or when
the plants rise from winter ; an elastic
body ; elastic force ; active power ; a leap ;
bound ; issue of water from the earth ; fountain ;
source ; rise ; and (obsolete) a youth : *springe* is
a gin ; noose : *springhalt*, a twitching lameness
of the horse : *springle*, a noose : *springtide*, high
tide ; tide at the full moon : *springy*, elastic ; full
of springs.

By the infinitness of the mercy of our God, in the
which he *springyng* up fro on high hath vic'ed us.

Wiclif. Luk. 1.

Israel's servants digged in the valley, and found a
well of *springing* water. *Genesis xxvi. 19.*

When the day began to *spring*, they let her go.

Judges.

About the *spring* of the day, Samuel called Saul to
the top of the house. *1 Samuel ix. 26.*

Ye shall eat this year such things as grow of

themselves ; and in the second year that which
springeth of the same. *2 Kings.*

To satisfy the desolate ground, and cause the bud
of the tender herb to *spring* forth. *Job xxxviii. 27.*

To them which sat in the region and shadow of
death, light is *sprung* up. *Matthew iv. 16.*

Other fell on good ground, and did yield fruit that
sprang up and increased. *Mark iv. 8.*

He called for a light, and *sprang* in, and fell before
Paul. *Acts.*

Our Lord *sprang* out of Juda. *Hebrews vii. 14.*
Before the bull she pictured winged love,
With his young brother sport, light fluttering
Upon the waves, as each had been a dove ;
The one his bow and shafts, the other *spring*
A burning tead about his head did move,
As in their sire's new love both triumphing.

Spenser.

Not mistrusting, till these new curiosities *sprung*
up, that ever any man would think our labour herein
mispent, or the time wastefully consumed. *Hooker.*

All blest secrets,

All you unpublished virtues of the earth,
Spring with my tears ; be aidant and remediate
In the good man's distress. *Shakspeare.*

How youngly he began to serve his country,
How long continued ; and what stock he *springs* of ;
The noble house of Marcius. *Id. Coriolanus.*

I *sprang* not more in joy at first hearing he was a
man child, than now in first seeing he had proved
himself a man. *Shakspeare.*

Orpheus with his lute made trees,
And the mountain-tops that freeze,
Bow themselves when he did sing :

To his musick plants and flowers

Ever *sprung*, as sun and showers

There had made a lasting *spring*.

Id. Henry VIII.

Now stop thy *springs* ; my sea shall suck them dry,
And swell so much the higher by their ebb.

Id. Henry VI.

As a woodcock to my own *springe*, Osrick,
I'm justly killed with mine own treachery.

Shakspeare.

They've all new legs, and lame ones ; one would
take it,
That never saw them pace before, the spavin
And *springhalt* reigned among them.

Id. Henry VIII.

Springs on the tops of hills pass through a great
deal of pure earth, with less mixture of other waters.

Bacon's Natural History.

Thus I reclaimed my buzzard love to fly
At what, and when, and how, and where I chose ;
Now negligent of sport I lie ;
And now, as other fawkners use,
I *spring* a mistress, swear, write, sigh, and die ;
And the game killed, or lost, go talk or lie. *Donne.*

Each petty hand

Can steer a ship becalmed ; but he that will
Govern, and carry her to her ends, must know
His tides, his currents ; how to shift his sails :

Where her *springs* are, her leaks, and how to stop 'em

Ben Jonson's Catiline

All these

Shall, like the brethren *sprung* of dragon's teeth,
Ruin each other, and he fall amongst 'em.

Ben Jonson.

The *spring* visiteth not these quarters so timely as
the eastern parts. *Carew.*

Fly, fly, prophane fogs ! far hence fly away.
Taint not the pure streams of the *springing* day

With your dull influence : it is for you
To sit and scoule upon night's heavy brow.

Crashaw

To that great *spring* which doth great kingdoms
move,
The sacred *spring* whence right and honour streams;
Distilling virtue, shedding peace and love
In every place, as Cynthia sheds her beams. *Davies.*
This may be performed by the strength of some
such *spring* as is used in watches: this *spring* may be
applied to one wheel, which shall give an equal mo-
tion to both the wings. *Wilkins.*

They found new hope to *spring*
Out of despair. *Milton.*

That *spring* the game you were to set,
Before you'd time to draw the net. *Hudibras.*
Let the wide world his praises sing,
Where Tagus and Euphrates *spring*;
And from the Danube's frosty banks to those
Where from an unknown head great Nilus flows.
Roscommon.

My doors are hateful to my eyes,
Filled and dammed up with gaping creditors,
Watchful as fowlers when their game will *spring*.
Outway.

Where there is a continued endeavour of the parts
of a body to put themselves into another state, the
progress may be much more slow; since it was a
great while before the texture of the corpuscles of the
steel were so altered as to make them lose their former
springiness. *Bayle.*

Mankind *spring* from one common original; whence
this tradition would be universally diffused.
Tillotson.

What makes all this but Jupiter the king,
At whose command we perish and we *spring*?
Then 'tis our best, since thus ordained to die,
To make a virtue of necessity.
Dryden's Knight's Tale.

When heaven was named, they loosed their hold
again;
Then *spring* she forth, they followed her again.
Dryden.

'Tis true from force the noblest title *spring*s,
I therefore hold from that which first made kings.
Id.

Thus man by his own strength to heaven would
soar,

And would not be obliged to God for more:
Vain, wretched creature, how art thou misled,
To think thy wit these godlike notions bred!
These truths are not the product of thy mind,
But dropt from heaven, and of a nobler kind:
Revealed religion first informed thy sight,
And reason saw not, till faith *spring*d the light. *Id.*

The prisoner with a *spring* from prison broke;
Then stretched his feathered fans with all his might,
And to the neighbouring maple winged his flight.
Id.

The nurse, surprised with fright,
Starts up and leaves her bed, and *spring*s a light. *Id.*
Love, like *spring*tides, full and high,
Swells in every youthful vein;

But each tide does less supply,
Till they quite shrink in again;
If a flow in age appear,
'Tis but rain, and runs not clear.

Id. Tyrannick Love.

Let goats for food their loaded udders lend;
But neither *springing* nets nor snares employ.
Dryden.

Whether she *spring*d a leak, I cannot find,
Or whether she was overset with wind,
But down at once with all her crew she went. *Id.*
Tall Norway fir their masts in battle spent,
And English oaks *spring* leaks and planks restore.
Id.

My heart sinks in me while I hear him speak,
And every slackened fibre drops its hold,

Like nature letting down the *spring*s of life;
So much the name of father awes me still. *Id.*

He adds the running *spring*s and standing lakes,
And bounding banks for winding rivers makes. *Id.*

I move, I see, I speak, discourse and know;
Though now I am, I was not always so:
Then that from which I was must be before,
Whom, as my *spring* of being, I adore. *Id.*

Heavens, what a *spring* was in his arm, to throw!
How high he held his shield, and rose at every blow!
Id.

People discharge themselves of burdensome reflec-
tions, as of the cargo of a ship that has *spring*d a leak.
L'Estrange.

Some have been deceived into an opinion that the
inheritance of rule over men, and property in things,
spring from the same original, and descend by the
same rules. *Locke.*

He that was sharp-sighted enough to see the cou-
figuration of the minute particles of the *spring* of a
clock, and upon what peculiar impulse its elastic
motion depends, would no doubt discover something
very admirable. *Id.*

He bathed himself in cold *spring* water in the
midst of winter. *Id.*

Nature is the same, and man is the same, has the
same affections and passions, and the same *spring*s
that give them motion. *Rymer.*

Our author shuns by vulgar *spring*s to move.
Pope.

Where the sandy or gravelly lands are *springy* or
wet, rather marl them for grass than corn.
Mortimer's Husbandry.

A link of horsehair, that will easily slip, fasten to
the end of the stick that *spring*s. *Id.*

The mountain stag that *spring*s
From height to height, and bounds along the plains,
Nor has a master to restrain his course,
That mountain stag would Vanoe rather be
Than be a slave. *Philip's Briton.*

The *spring* must be made of good steel, well tem-
pered; and the wider the two ends of the *spring* stand
asunder, the wider it throws the chape of the vice
open. *Moxon's Mechanical Exercises.*

Most people die when the moon chiefly reigns;
that is, in the night, or upon or near a *spring*tide.
Grew's Cosmologia.

Our miners discovered several of the enemies'
mines, who have *spring*d divers others which did
little execution. *Tatler.*

Do not blast my *springing* hopes,
Which thy kind hand has planted in my soul.
Rowe.

I *spring*d a mine, whereby the whole nest was
overthrown. *Addison's Spectator.*

A covey of partridges *springing* in our front, put
our infantry in disorder. *Addison.*

A large cock pheasant he *spring*d in one of the
neighbouring woods. *Id. Spectator.*

Here I use a great deal of diligence before I can
spring any thing; whereas in town, whilst I am fol-
lowing one character, I am crossed by another, that
they puzzle the chase. *Addison.*

The soul is gathered within herself, and recovers
that *spring*, which is weakened when she operates
more in concert with the body. *Id.*

He that has such a burning zeal, and *spring*s such
mighty discoveries, must needs be an admirable patri-
ot. *Collier.*

This vast contraction and expansion seems unin-
telligible, by feigning the particles of air to be *springy*
and ramous, or rolled up like hoops, or by any other
means than a repulsive power. *Newton.*

Bodies which are absolutely hard, or so soft as to
be void of elasticity, will not rebound from one ano-
ther; impenetrability makes them only stop. If two

equal bodies meet directly in vacuo, they will by the laws of motion stop where they meet, lose their motion, and remain in rest; unless they be elastic, and receive new motion from their *spring*. *Newton.*

See, awed by heaven, the blooming Hebrew flies
Her artful tongue, and more persuasive eyes;
And, *springing* from her disappointed arms,
Prefers a dungeon to forbidden charms. *Blackmore.*

Had not the Maker wrought the *springy* frame,
Such as it is, to fan the vital flame,
The blood, defrauded of its nitrous food,
Had cooled and languished in the arterial road;
While the tired heart had strove, with fruitless pain,
To push the lazy tide along the vein.

Id. Creation.

The reason of the quicker or slower termination of this distemper, arises from these three *spring*s.

Blackmore.

See how the well-taught pointer leads the way!
The scent grows warm; he stops, he *spring*s the prey.

Gay.

In adult persons, when the fibres cannot any more yield, they must break, or lose their *spring*.

Arbutnot.

Though the bundle of fibres which constitute the muscles may be small, the fibres may be strong and *springy*.

Id.

Heroes of old, by rapine and by spoil,
In search of fame did all the world embroil;
Thus to their gods each then allied his name,
This *spring* from Jove, and that from Titan came.

Granville.

The air is a thin fluid body, endowed with elasticity and *springiness*, capable of condensation and rarefaction.

Bentley.

If our air had not been a *springy* body, no animal could have exercised the very function of respiration; and yet the ends of respiration are not served by that *springiness*, but by some other unknown quality.

Id. Sermons.

Now from beneath Maleas' airy height
Aloft she *spring*s, and steered to Thebes her flight.

Pope.

Who *spring* from kings shall know less joy than I.

Id.

Swift fly the years, and rise the' expected morn!
Oh *spring* to light, auspicious babe, be born!

Id.

Tell me, in what happy fields

The thistle *spring*s, to which the lily yields?

Id.

Even thought meets thought, ere from the lips it part,

And each warm wish *spring*s mutual from the heart.

Id.

The friendly gods a *springing* gale enlarged;
The fleet swift tilting o'er the surges flew,
Till Grecian cliffs appeared.

Id.

With hairy *spring*s we the birds betray,
Slight lines of hair surprise the finny prey.

Id.

Our author shuns by vulgar *spring*s to move.
The friends to the cause *spring* a new project;
and it was advertised that the Crisis could not appear, till the ladies had shown their zeal against the Pretender.

Swift.

The first *spring*s of great events, like those of great rivers, are often mean and little.

Id.

Come, gentle *spring*, ethereal mildness, come,
And from the bosom of yon dropping cloud
Upon our plains descend.

Thomson's Spring.

Unbeseeing skill

To *spring* the fence, to rein the prancing steed.

Thomson.

The haunt o' *spring*'s the primrose brae,

The simmer joys the flocks to follow,

How cheery through her shortening day

Is autumn, in her weeds o' yellow!

Burns.

SPRING, in cosmography, denotes one of the seasons of the year; commencing, in the northern parts of the world, on the day the sun enters the first degree of Aries, which is about the tenth day of March, and ending when the sun leaves Gemini; or, more strictly and generally, the spring begins on the day when the distance of the sun's meridian altitude from the zenith, being on the increase, is at a medium between the greatest and least. The end of the spring coincides with the beginning of summer. See *SUMMER*.

SPRING, in mechanics, denotes a thin piece of tempered steel, or other elastic substance, which, being wound up, serves to put machines in motion by its elasticity, or endeavours to unbend itself; such is the spring of a watch, clock, or the like.

SPRING, ELATER, in physics, denotes a natural faculty, or endeavour, of certain bodies to return to their first state, after having been violently put out of the same by compressing, or bending them, or the like. This faculty is usually called by philosophers elastic force or elasticity.

SPRINGS. Many have been the conjectures of philosophers concerning the origin of fountains, and great pains have been taken by the members of the Royal Society, and those of the Academy of Sciences at Paris, to ascertain the true cause of it. It was Aristotle's opinion, and held by most of the ancient philosophers after him, that the air contained in the caverns of the earth, being condensed by cold near its surface, was thereby changed into water; and that it made its way through where it could find a passage. And this transmutation of air into water strictly accords with the recent discoveries that water in fact is compounded of nothing else but two kinds of air, though it is hardly to be supposed that Aristotle had the most distant idea of this fact. Those who imagine, that fountains owe their origin to waters brought from the sea by subterraneous ducts, give a tolerable account how they lose their saltiness by percolation as they pass through the earth; but they cannot explain by what power the water rises above the level of the sea to near the tops of mountains, where springs generally abound; it being contrary to the laws of hydrostatics that a fluid should rise in a tube above the level of its source. It was a generally received opinion, and much espoused by Mariotte, that the rise of springs is owing to the rains and melted snow. The rain water, he says, which falls upon the hills and mountains, penetrating the surface, meets with clay or rocks contiguous to each other; along which it runs, without being able to penetrate them, till, being got to the bottom of the mountain or to a considerable distance from the top, it breaks out of the ground, and forms springs. To examine this opinion Mr. Perrault, De la Hire, and D. Sideleau, endeavoured to make an estimate of the quantity of rain and snow that falls in a year, to see whether it would be sufficient to afford a quantity of water equal to that which is annually discharged into the sea by the rivers. The result of their enquiries was, that the quantity of rain and snow which fell in a year into a cylindrical vessel would fill it (if secured from evaporating) to the height of about nineteen inches; which quantity, D. Sideleau

showed, was not sufficient to supply the rivers; for that those of England, Ireland, and Spain, discharge a greater quantity of water annually than the rain, according to that experiment, is able to supply. Another observation was made by them, that the quantity of water raised in vapor, one year with another, amounted to about thirty-two inches, which is thirteen more than falls in rain: a plain indication that the water of fountains is not supplied by rain and melted snow. Thus the true cause of the origin of fountains remained undiscovered till Dr. Halley, in making his celestial observations upon the tops of the mountains at St. Helena, about 800 yards above the level of the sea, found that the quantity of vapor which fell there (even when the sky was clear) was so great that it very much impeded his observations, by covering his glasses with water every half quarter of an hour; and upon that he attempted to determine by experiment the quantity of vapor exhaled from the surface of the sea, as far as it rises from heat, to try whether that might be a sufficient supply for the water continually discharged by fountains. His experiment was as follows:—He took a vessel of water salted to the same degree with that of sea-water, in which he placed a thermometer; and, by means of a pan of coals, brought the water to the same degree of heat, which is observed to be that of the air in our hottest summer; this done he fixed the vessel of water, with the thermometer in it, to one end of a pair of scales, and exactly counterpoised it with weights on the other: then, at the end of two hours, he found, by the alteration made in the weight of the vessel, that about a sixtieth part of an inch of the depth of the water was gone off in vapor; and therefore, in twelve hours, one-tenth of an inch would have gone off. Now this accurate observer allows the Mediterranean Sea to be 40° long, and 4° broad, so that its whole surface is 160 square degrees; which must yield at least 5,280,000,000 tons of water: in which account no regard is had to the wind and the agitation of the surface of the sea, both which undoubtedly promote the evaporation. It remained now to compare this quantity of water with that which is daily conveyed into the same sea by the rivers. The only way to do which was to compare them with some known river; and accordingly he takes his computation from the river Thames; and, to avoid all objections, makes allowances, probably greater than were necessary. The Mediterranean receives the rivers Iberus, Rhone, Tiber, Po, Danube, Niester, Borysthenes, Tanais, and Nile. Each of these he supposes to bring down ten times as much water as the Thames, whereby he allows for smaller rivers which fall into the same sea. The Thames, then, he finds by mensuration to discharge about 20,300,000 tons of water a day. If therefore the above nine rivers yield ten times as much water as the Thames doth, it follows, that all of them together yield but 1,827,000,000 of tons in a day, which is little more than one-third of what is proved to be raised in vapor out of the Mediterranean in the same time. We have therefore a source abundantly sufficient for the supply of fountains. The doctor considers next the manner in which they

are raised, and how they are condensed into water again, and conveyed to the sources of springs. He considers that if an atom of water was expanded into a shell or bubble, so as to be ten times as big in diameter as when it was water, that atom would become specifically lighter than air, and therefore would rise so long as the warmth which first separated it from the surface of the water should continue to distend it to the same degree; and, consequently, that vapors may be raised from the surface of the sea in that manner, till they arrive at a certain height in the atmosphere, at which they find air of equal specific gravity with themselves. Here they will float till, being condensed by cold, they become specifically heavier than the air, and fall down in dew; or being driven by the winds against the sides of mountains (many of which far surpass the usual height to which the vapors would of themselves ascend), are compelled by the stream or the air to mount up with it to the tops of them; where, being condensed into water, they presently precipitate, and gleeing down by the crannies of the stones, part of them enters into the caverns of the hills; which being once filled, all the overplus of water that comes thither runs over by the lowest place, and breaking out by the sides of the hills forms single springs. Many of these running down by the valleys between the ridges of the hills, and coming to unite, form little rivulets or brooks; many of these again meeting in one common valley, and gaining the plain ground, being grown less rapid, become a river; and many of these, being united in one common channel, make such streams as the Rhine and the Danube; which last is the sum of all those springs which break out on the south side of the Carpathian mountains, and on the north side of the immense ridge of the Alps. Thus one part of the vapors which are blown on the land is returned by the rivers into the sea whence it came. Another part falls into the sea before it reaches the land; and this is the reason why the rivers do not return so much water into the Mediterranean as is raised in vapor. A third part falls on the low lands, where it affords nourishment to plants; yet it does not rest there, but is again exhaled in vapor by the action of the sun, and is either carried by the winds to the sea to fall in rain or dew there, or else to the mountains to become the sources of springs. Besides these causes some streams arise from rain and melted snow, which, subsiding through the surface of the earth, makes its way into certain cavities, and thence issues out in the form of springs; because the waters of several increase and diminish in proportion to the rain which falls: others again, especially such as are salt, and spring near the sea-shore, owe their origin to sea-water percolated through the earth; and some to both these causes. The above reasoning of Dr. Halley is confirmed by more recent discoveries. It is now found that, though water is a tolerable conductor of the electric fluid, dry earth is an electric per se, consequently the dry lands must always be in an electrified state compared with the ocean, unless in such particular cases as are mentioned under the article EARTHQUAKE. It is also well known that such bodies as are in an electrified

state, whether plus or minus, attract vapor, or other light substances. Hence the vapors that are raised from the ocean must necessarily have a tendency to approach the land in great quantity, even without the assistance of the wind, though this last undoubtedly contributes much to the same purpose. The higher grounds are always in a more electrified state than the lower ones; and hence the vapors, having once left the ocean and approached the shore, are attracted by the high mountains; of which Mr. Pennant gives an instance in Snowdon. See SNOWDON. Hence we may see the reason why springs are so common in the neighbourhood of mountains, they being so advantageously formed in every respect for collecting and condensing the vapors into water. But now that the nature and composition of water have been so decisively proved, we need have no hesitation to ascribe the origin of all springs and fountains to this general cause, the meeting of oxygen and hydrogen, and the consequent conversion of these airs into water. This also is probably the cause of rain.

The heat of springs is generally the same with the mean temperature of the atmosphere. The mean temperature of the south of England is 48°; in Scotland, near Edinburgh, it is 45°; in the north of Ireland it is 48°, and on the south coast about 51°. Dr. Hutton makes the mean heat of springs near Edinburgh 47°, and that of London 51°. At Upsal, in Sweden, it is 43°, and in Paris 53°. According to accurate experiments made by eminent philosophers, the heat of the springs in these different countries corresponds with the medium temperature. Though this coincidence of the heat of springs with the mean temperature of the climate where they flow seems to be a general fact, yet it admits of many exceptions. In many parts of the world there are springs which not only exceed the mean temperature, but even the strongest meridian heat ever known in the torrid regions. The following table shows the degrees of heat which different springs possess according to the experiments of philosophers:—

Places.	Springs.	Highest Lowest	
		deg. of heat.	deg. of heat.
Bristol,	St. Vincent's,	84	76
Buxton,	Gentleman's bath,	82	
Matlock,		69	
Bath,	King's bath,	119	113
Aix-la-Chapelle,		146	136
Barege,		122	
Pisa,		104	
Caroline baths	Prudel,		
in Bohemia,		165	
Iceland,	Geyzer,	212	

In cold countries, where congelation takes place, the heat of the earth is considerably above the freezing point, and continues so through the whole year. From experiments made in mines and deep pits this heat is uniform and stationary at a certain depth. The heat of these springs far exceeds the common heat of the internal parts of the earth; but the causes are not easy to determine. The subterranean heat has been ascribed to the electrical fluid, and to a great body of fire in the centre of the earth. The electrical fluid seems at least a probable cause, but as to the

supposition that the heat of springs is owing to a central fire, it is too hypothetical to require any refutation. Hot springs are always found among combustible substances. It is well known that when water is mixed with the sulphuric acid, a degree of heat is produced superior to that of boiling water; and when water meets with pyrites a violent inflammation takes place. If, therefore, we could prove that these materials exist in the strata from which hot springs are derived, we should be enabled to give a satisfactory account of this curious phenomenon. As some ground for this supposition we may add, that most of the hot springs mentioned above have been found by analysis to be impregnated with sulphur, and some of them with iron. It must, however, be acknowledged that the hot springs of Iceland, which are 112°, the heat of boiling water, according to an accurate analysis of their contents by the ingenious Dr. Black, were neither found to contain iron nor sulphur. We must therefore continue to collect facts till the sciences of chemistry and mineralogy shall be so far advanced as to enable us to form a permanent theory on this subject.

Springs are of different kinds. Some are perennial, or continue to flow during the whole year; others flow only during the rainy season; some ebb and flow. At Torbay there is one of this kind which ebbs and flows five or six inches every hour. There is another near Coriso in Italy which ebbed and flowed three times a day in the time of Pliny, and continues to do so still. A spring near Henly sometimes flows for two years together, and then dries up for an equal period. The cause of this is explained under HYDROSTATICS.

SPRING BOCK. See CAPRA.

SPRINGER, in zoology. See CAPRA.

SPRINGFIELD, a post town and capital of Hampden county, Massachusetts, on the east side of the Connecticut; eighteen miles south of Northampton, twenty-eight north of Hartford, forty-eight W. S. W. of Worcester, and eighty-eight west by south of Boston; is a pleasant and flourishing town, and contains a court house, a jail, a bank, a woollen manufactory, a rope walk, a furnace, two paper mills, two congregational churches, two public libraries, which together contain about 1000 volumes, and a printing office, from which is issued a weekly newspaper. Here is a large, pleasant, and handsome village, which has considerable trade, and contains a number of elegant houses. An excellent covered bridge, connecting this town with West Springfield, was carried away by the rise of the river in 1818.

There is in this town, belonging to the United States, a very extensive establishment for the manufacture of arms. The arsenal is delightfully situated on an elevated plain about half a mile east of the village. The buildings are finely arranged around a level square of twenty acres, and make an elegant appearance. One building is 204 feet by thirty-two, of two stories, with a cupola, which affords an extensive and interesting view of Connecticut River and the surrounding country; another is 100 by forty; a third sixty by thirty-two; all of brick, two

stories high. The second story of the last, forming a spacious hall, is consecrated as a place of public worship. There are also other buildings for workshops, store houses, &c., and seventeen dwelling houses.

The water-works are situated about a mile south of the arsenal, in three divisions, denominated Upper, Middle, and Lower, water shops, on Mill River, a fine stream which falls into the Connecticut. They form the greatest collection of mills and other water-works in the state. The whole comprises five work shops, twenty-eight forges, ten trip hammers, eighteen water-wheels, nine coal houses, three stores, and five dwelling houses.

This establishment employs from 240 to 250 workmen, who complete on an average about forty-five muskets daily. It is estimated that the cost of muskets at Springfield is 1356 dollars each; at Harper's Ferry 1425 dollars.

SPRINGFIELD, WEST, a post-town of Hampden county, Massachusetts, on the west side of the Connecticut, opposite Springfield. This is a pleasant and valuable agricultural town, and contains four parishes, in each of which is a meeting-house, and three post-offices, West Springfield, Agawam, and Feeding Hills. This is also the name of numerous smaller townships of the United States.

SPRINGTIDE. See ASTRONOMY, INDEX, and TIDE.

SPRINKLE, *v. a. & v. n.* Sax. *pprengan*; Belg. *sprinkelen*; Swed. *sprenga*. To scatter; disperse in small masses or drops; bedew; christen: to perform the act of scattering in this way: sometimes written SPRINGLE.

Take handfuls of ashes of the furnace, and let Moses *sprinkle* it towards the heaven. *Exodus ix. 8.*

The priest shall *sprinkle* of the oil with his finger. *Leviticus xiv.*

Sprinkle water of purifying upon them. *Numbers viii. 7.*

Let us draw near with a true heart, in full assurance of faith, having our hearts *sprinkled* from an evil conscience. *Hebrews.*

'This is Timon's last,

Who, stuck and spangled with your flatteries,
Washes it off, and *sprinkles* in your faces
Your reeking villany. *Shakspeare. Timon of Athens.*

Woodcocks arrive first on the north coast, where every splash-shoot serveth for *sprinkles* to take them. *Carew.*

Wings he wore

Of many a coloured plume *sprinkled* with gold. *Milton.*

The prince with living water *sprinkled* o'er
His limbs and body; then approached the door,
Possessed the porch. *Dryden's Æneid.*

To content and fill the eye of the understanding,
The best authors *sprinkle* their works with pleasing digressions, with which they recreate the minds of their readers. *Dryden.*

Baptism may well enough be performed by *sprinkling*, or effusion of water. *Ayliffe's Pavergon.*

When dext'rous damself twirl the *sprinkling* mop,
And cleanse the spattered ash, and scrub the stairs,
Know Saturday appears. *Gay's Trivia.*

SPRIT, *v. a. v. n. & n. s.* Sax. *ppryctan*; Belg. *spruyten*; Swed. *spruta*; Goth. *sprida, sprita*. To throw out; eject with force: shoot; germinate: a shoot or sprout: commonly written spirt.

Toads sometimes exclude or *sprit* out a dark and liquid matter behind, and a venomous condition there may be perhaps therein; but it cannot be called their urine. *Broune.*

The barley, after it has been couched four days, will sweat a little, and shew the chit or *sprit* at the root-end of the corn. *Mortimer's Husbandry.*

The SPRIT, in botany, consists of two parts; viz. the radical and plume; the latter among malsters is called the acospire.

SPRIT, in boat-building, a small boom or pole which crosses the sail of a boat diagonally from the mast to the upper hindmost corner of the sail, which it is used to extend and elevate; the lower end of the sprit rests in a sort of wreath or collar called the smotter, which encircles the mast in that place.

SPRITSAIL, *n. s.* Sprit and sail. The sail which belongs to the boltsprit mast.

Our men quitted themselves of the fireship, by cutting the *spritsail* tackle off with their short hatchets. *Wiseman.*

SPRITSAIL. See SAIL and SHIP.

SPRITSAIL-TOPSAIL. See SAIL and SHIP.

SPROUT, *v. n. & n. s.* Sax. *ppryctan*; Belg. *spruyten*. Sprout, sprit, and by a very frequent transposition spirt or spurt, are all radically, as Dr. Johnson says, the same word. To shoot by vegetation; germinate; ramify: a vegetable shoot.

Try whether these things in the *sprouting* do increase weight, by weighing them before they are hanged up; and afterwards again, when they are *sprouted*. *Bacon.*

Stumps of trees, lying out of the ground, will put forth *sprouts* for a time. *Id.*

Vitriol is apt to *sprout* with moisture. *Id.*

The *sprouting* leaves that saw you here,
And called their fellows to the sight. *Cowley.*

Early, ere the odorous breath of morn
Awakes the slumbering leaves, or tassell'd horn
Shakes the high thicket, haste I all about,
Number my ranks, and visit every *sprout*. *Milton.*

We find no security to prevent germination, having made trial of grains, whose ends, cut off, have notwithstanding *sprouted*. *Broune's Vulgar Errors.*

Old Baucis is by old Philemon seen

Sprouting with sudden leaves of sprightly green
Dryden.

To this kid, taken out of the womb, were brought
In the tender *sprouts* of shrubs; and, after it had
tasted, it began to eat of such as are the usual food
of goats. *Ray on the Creation.*

'Rub malt between your hands to get the come or
sprouting clean away. *Mortimer's Husbandry.*

Envid Britannia, sturdy as the oak
Which on her mountain top she proudly bears,
Eludes the ax, and *sprouts* against the stroke,
Strong from her wounds, and greater by her wars. *Prior.*

Hence *sprouting* plants enrich the plain and wood;
For physick some, and some designed for food. *Blackmore.*

The' enlivening dust its head begins to rear,
And on the ashes *sprouting* plumes appear. *Ticket.*

SPROUT, in botany. See PLANT and SPRIT.
SPRUCE, *adj.* Skinner hesitatingly derives this word from Fr. *preur*. Junius from spront. I know not whence to deduce it, except from pruce, says Dr. Johnson, a thing costly and elegant, and thence probably came spruce. Mr. Thompson refers to the Teut. *spreisse, spreissen*;

Swed. *spruka, sprutta*, to glitter, be lively. Nice; trim; neat without elegance. It was anciently used of things with a serious meaning; it is now used only, with levity, of persons.

The tree

That wraps that crystal in a wooden tomb,
Shall be took up *spruce*, filled with diamond.

Donne.

Thou wilt not leave me in the middle street,
Though some more *spruce* companion thou dost meet.

Id.

Along the crisped shades and bowers
Revels the *spruce* and jocund spring;

The graces, and the rosy-bosomed hours,
Thither all their bounties bring.

Milton.

He put his band and beard in order,
The *sprucer* to accost and board her.

Hudibras.

I must not slip into too *spruce* a style for serious
matters; and yet I approve not that dull insipid
way of writing practised by many chymists.

He is so *spruce*, that he can never be genteel.

Tatler.

This Tim makes a strange figure with that ragged
coat under his livery: can't he go *spruce* and clean?

Arbuthnot.

SPRUCE FIR. See PINUS.

SPRUCEBEER', *n. s.* From spruce, Germ. *preussin*, a kind of fir. Beer tinctured with branches of fir.

In ulcers of the kidneys, *sprucebeer* is a good balsamic.

Arbuthnot.

SPRUCE BEER, a cheap and wholesome liquor thus made:—Take of water sixteen gallons and boil the half of it. Put the water thus boiled, while in full heat, to the reserved cold part, which should be previously put into a barrel or other vessel; then add sixteen pounds of treacle or molasses, with a few table spoonfuls of the essence of spruce, stirring the whole well together; add half a pint of yeast, and keep it in a temperate situation, with the bung hole open, for two days, till the fermentation be abated. Then close it up or bottle it off, and it will be fit for being drunk in a few days afterwards. In North America and perhaps in other countries where the black and white spruce firs abound, instead of adding the essence of the spruce at the same time with the molasses, they make a decoction of the leaves and small branches of these trees, and find the liquor equally good. It is a powerful antiscorbutic, and may prove very useful in long sea voyages.

SPRUCELEATHER', *n. s.* Corrupted from Prussian leather.

The leather was of *Pruce*. *Dryden's Fables.*

SPUD, *n. s.* Irish *spud*; Welsh *yspod*. A short knife used for weeding; a small spade; any short thick thing, in contempt.

My love to Sheelah is more firmly fixt
Than strongest weeds that grow these stones betwixt;

My *spud* these nettles from the stones can part,
No knife so keen to weed thee from my heart.

Swift.

SPUME, *n. s.* } Lat. *spuma*. Foam; froth:
SPUMOUS, *adj.* } the adjective corresponding.
SPUMY.

Materials dark and crude,

Of spirituous and fiery *spume*, till touched
With heaven's ray, and tempered, they shoot forth
So beauteous, opening to the ambient light. *Milton.*

Waters frozen in pans, after their dissolution, leave a froth and *spume* upon them, which are caused by the airy parts diffused by the congealable mixture.

Brown's Vulgar Errors.

The cause is the putrefaction of the body by unnatural heat: the putrifying parts suffer a turgescence, and, becoming airy and *spumous*, ascend unto the surface of the water.

Browne.

Not with more madness rolling from afar,
The *spuny* waves proclaim the watery war;
And, mounting upwards with a mighty roar,
March onwards, and insult the rocky shore. *Dryden.*

The *spumous* and florid state of the blood, in passing through the lungs, arises from its own elasticity, and its violent motion, the aerial particles expanding themselves.

Arbuthnot.

SPUN YARN, among sailors, a small line or cord formed of two or three rope-yarns twisted together by a winch; the yarns, of which it is usually made at sea, are drawn out of the strands of old cables, or other ropes, and are knotted together and tarred. It is employed for several purposes, particularly to fasten one rope to another, to seize block-strops to the shrouds, and to serve ropes which are liable to be chafed, &c.

SPUNGE, *n. s. & v. n.* } Lat. *spongia*. A
SPUN'GINGHOUSE, *n. s.* } sponge. See SPONGE.
SPUN'GY, *adj.* } To hang on others for maintenance: a spunging-house is a house to which bailiffs take debtors and sponge them: spungy, of the nature of sponge; having the quality of imbibing wet.

When he needs what you have gleaned, it is but
squeeze you, and, *spunge*, you shall be dry again.

Shakspeare. Hamlet.

I saw Jove's bird, the Roman eagle, winged
From the *spungy* south to this part of the west,
There vanished in the sun-beams. *Id. Cymbeline*

There is no lady of more softer bowels,
More *spungy* to suck in the sense of fear.

Shakspeare.

Some English wool, vexed in a Belgian loom,
And into cloth of *spungy* softness made,
Did into France or colder Denmark roam,
To ruin with worse air our staple trade. *Dryden.*

Considering the motion that was impressed by the painter's hand upon the *spunge*, compounded with the specific gravity of the *spunge* and the resistance of the air, the *spunge* did mechanically and unavoidably move in that particular line of motion.

Bentley's Sermons.

This will maintain you, with the perquisite of
spunging while you are young. *Swift to Gay.*

A bailiff kept you the whole evening in a *spunging-house*. *Swift.*

SPUNGE, or SPONGE. See SPONGIA.

SPUNGE is used, in gunnery, for a cylinder of wood, from ten to twelve inches long, of the same diameter with the rammer, with a piece of sheep or lamb-skin wound about its end, to serve for scouring great guns when discharged, before they be charged with fresh powder; hence called spunging. In small guns it is commonly fixed to the other end of the handle of the rammer; but has a separate one in those of a larger calibre.

SPUNGING, in gunnery, the cleaning of the inside of a gun with a sponge, in order to prevent any sparks of fire from remaining in it, which would endanger the life of him that should load it again.

SPUNK, *n. s.* See **SPONK**. Rotten wood; touch-wood.

To make white powder, the best way is by the powder of rotten willows: *spunk*, or touchwood prepared, might perhaps make it russet.

Broune's Vulgar Errors.

SPUNK, a term used indifferently for half-rotten wood, match for guns, and a substance growing on the sides of trees.

SPUNK, in botany. See **BOLETUS**.

SPUR, *n. s., v. a. & v. n.* } **Sax.** *ƿyppa*; **Dan.** *SPUR* *GALLED*, *adj.* } *spore*: **Isl.** *Dut.* and **Goth.** *spor*. A sharp point fixed in the rider's heel, with which he pricks his horse forward; a point on the cock's leg; any prick or stimulus: to prick with a spur; instigate; excite; drive forward: to press forward; travel expeditiously: spurgalled is hurt with the spur.

He borrowing that homely armour for want of a better, had come upon the *spur* to redeem Philoclea's picture.

Sidney.

Seeing then that nothing can move, unless there be some end, the desire whereof provoketh unto motion, how should that divine power of the soul, that spirit of our mind, ever stir itself into action, unless it have also the like *spur*?

Hooker.

He presently set *spurs* to his horse, and departed with the rest of the company.

Knolles's History of the Turks.

Whether the body politick be
A horse whereon the governour doth ride,
Who, newly in the seat, that it may know
He can command it, lets it straight feel the *spur*.

Shakspeare.

Grief and patience, rooted in him both,
Mingle their *spurs* together.

Id. Cymbeline.

The strong-based promontory
Have I made shake, and plucked up by the *spurs*
The pine and cedar.

Shakspeare.

I was not made a horse,
And yet I bear a burthen like an ass,
Spurgalled and tired by jaunting Bolingbroke.

Id.

His laws are deep, and not vulgar; not made upon the *spur* of a particular occasion; but out of providence of the future, to make his people more and more happy.

Bacon.

Of birds the bill is of like matter with the teeth; as for their *spur*, it is but a nail.

Id.

Was I for this intitled Sir,
And girt with rusty sword and *spur*,
For fame and honour to wage battle?

Hudibras.

Reward is the *spur* of virtue in all good arts, all laudable attempts; and emulation, which is the other *spur*, will never be wanting when particular rewards are proposed.

Dryden.

Your father, when he mounted,
Reined 'em in strongly, and he *spurred* them hard.

Id.

Ascanius took the' alarm, while yet he led,
And, *spurring* on, his equals soon o'erpass'd.

Id. Æneid.

The chief, if not only *spur*, to human industry and action, is uneasiness.

Locke.

Let the awe he has got upon their minds be so tempered with the marks of good will, that affection may *spur* them to their duty.

Id.

Animals have natural weapons to defend and offend; some talons, some claws, some *spurs* and beaks.

Ray.

Some bold men, though they begin with infinite ignorance and error, yet, by *spurring* on, refine themselves.

Greiv.

My friend, who always takes care to cure his horse

of starting fits, *spurred* him up to the very side of the coach.

Addison.

Who would be at the trouble of learning when he finds his ignorance is caressed? But, when you brow-beat and maul them, you make them men; for, though they have no natural mettle, yet, if they are *spurred* and kicked, they will mend their pace.

Collier on Pride.

The former may be a *spur* to the latter, till age makes him in love with the study, without any childish bait.

Cheyne.

What! shall each *spurgalled* hackney of the day,
Or each new-pensioned sycophant, pretend
To break my windows, if I treat a friend?

Pope.

Thus reputation is a *spur* to wit,
And some wits flag through fear of losing it.

Cruper.

A **SPUR** is a piece of metal consisting of two branches encompassing a horseman's heel, and a rowel in form of a star advancing out behind. Louis le Debonnair forbade ecclesiastics the wearing of spurs. Anciently the difference between the knight and esquire was that the knight wore gilt spurs, whence the appellation of eques auratus, and the squire silvered ones. Two sorts of spurs seem to have been in use about the time of the Conquest, one called a pryck, having only a single point like the gaffle of a fighting-cock; the other consisting of a number of points of considerable length, radiating from and revolving upon a centre, thence named the rouelle or wheel-spur. Delineations of the first occur in the seals of most of our kings and great barons prior to the reign of Edward III., and also on the engraved and sculptured figures of cross-legged knights. The rouelle is sometimes found on figures of equal antiquity; instances occurring of the same person being delineated with the pryck-spur on one seal and the rouelle on another. Some specimens of the pryck-spur are still to be found in the cabinets of the curious.

SPUR, jingling, a curious spur which was worn in the seventeenth century. Mr. Harte, in his ingenious translation of the Life of Gustavus Adolphus, king of Sweden, has furnished the following particulars respecting it. His words are—'I have seen one of these jingling spurs which was found in the Star Park, on the famous White Mountain, near Prague, where the battle was fought between the imperialists and troops of the union; by the event of which the elector palatine lost the crown of Bohemia. The spur was large and strong; it was made of brass, and had a short curved neck. The box (from whose centre the rowels came) was as broad as a half-crown piece; hollow, and something more than a quarter of an inch. It was of bell-metal gilt, and contained three or four metal balls about the size of a small field pea. The rowels, which were generally four or six, passed through the sides of the box, and measured nearly three inches from opposite point to point.' In the text it is observed (Essay, vol. i. p. 43) that it is thought these spurs were made to jingle in order to animate the horses, and keep them up to their duty, without goring their flanks unmercifully.

SPUR, in agriculture, is the name of a disease which frequently attacks rye, and sometimes wheat. It is found that the grains which have

the spur are thicker and longer than the sound ones, and generally project beyond their husks, appearing sometimes straight, and sometimes more or less crooked; and that their outsides are brown or black; their surface is rough, and three furrows may frequently be perceived in them which run from end to end. Their outward end is always thicker than that which sticks to the chaff, and the most swollen end is sometimes split into two or three parts. It is not unusual to find on their surfaces cavities which seem to have been made by insects.

SPUR was anciently a piece of the armour of a cavalier fastened to the talar, that is, the hind part of that piece of a complete armour which covers the legs and feet. At present the spur is a piece of iron or other metal.

SPUR, ORDER OF THE GOLDEN, in Rome, supposed by several writers to have been instituted by pope Pius IV., in 1559. The badge is a star of eight points *argent*, and between the two bottom points a spur *or*.

SPURS, in old fortifications, are walls that cross a part of the rampart and join to the town wall.

SPURS, in the construction of a wooden bridge, are braces which prop the two pillars that support it. The French use the word *éperon*.

SPURGE, *n. s.* Fr. *espurge*; Belg. *spurgie*; Lat. *purgo*. A plant violently purgative: a general name in English for various milky purgative plants.

SPURGE, in botany. See EUPHORBIA.

SPURGE LAUREL. See DAPHNE.

SPURGE OLIVE. See DAPHNE.

SPURGE WORT is a species of iris.

SPURIOUS, *adj.* } Lat. *spurius*. Not ge-

SPURIOUSNESS, *n. s.* } *niine*; counterfeit; adulterine; bastard: the noun substantive corresponding.

SPURLING, *n. s.* Fr. *esperlan*. A small sea-fish.

SPURLING, or SPARLING. See SALMO.

SPURN, *v. a. v. n. & n. s.* Sax. *spornan*, from *ppon*, the foot. To kick; strike or drive with the foot; hence to reject; scorn: a kick; contemptuous treatment.

SPURT, *v. n.* See *To SPIRT*. To fly out with a quick stream.

SPURZHEIM (Dr. G.), a celebrated phrenologist, born at Tongueits, near Treves, on the Moselle, and, being destined by his father for the clerical profession, educated at the university of Treves. On the invasion of Germany by the French, in 1799, he removed to Vienna, where he became acquainted with Dr. Gall, and from a hearer, was soon converted into an associate in his labours. Having completed his medical studies, he quitted Vienna, in company with Gall, whose doctrines he fully adopted in 1805, and visited Berlin, delivering lectures on the structure of the brain in that city, and elsewhere on the continent. After this period, until 1810, he was engaged, in conjunction with Gall, in preparing for publication in Paris, their great work, entitled "Anatomie et Physiologie du Systeme Nerveux en general, et du Carveau en particulier," in four vols. folio, with a hundred atlas plates, price £40, each copy. After this,

Spurzheim published, unassisted, his *Observations sur Phrenologie*, and treatises on Education. In 1813 he again revisited Vienna, where he took the degree of M. D., and in 1814 came to England; here he published two editions of his "Physiognomical System," his *Outlines*, and a *Dissertation on Insanity*. In Great Britain he delivered lectures, which were heard with attention in London, Dublin, Edinburgh, Liverpool, Cork, Bristol, and Bath. On his return to Paris, he contributed to the advancement of Phrenology, by many important discoveries, by a more philosophic arrangement, and by pointing out its application to many useful purposes. In 1825, he revisited London, and delivered lectures at several public rooms, besides several courses on the dissection and anatomy of the brain at St. Thomas's and St. Bartholomew's Hospitals. In England he published his "Phrenology, or the Doctrine of the Mind," &c., and "A View of the Philosophical Principles of Phrenology." He continued to lecture in the various provincial towns of Great Britain and Ireland, for some years longer, and received much applause, in addition to a high degree of esteem which he obtained as a gentleman and scholar. During his latter visit to England he published "The Anatomy of the Brain," and a "A General View of the Nervous System;" "Phrenology in Connection with the Study of Physiognomy;" "A Sketch of the Natural Laws of Man;" besides many pamphlets and letters, defensive of his system. The death of his wife, in 1829, who had made the drawings and lithographic engravings for all his works, induced him to seek alleviation of sorrow in travelling; and in 1832 he sailed for America, where he met a most gratifying reception, and delivered lectures in Boston, to crowded auditories. The climate of America made sudden inroads upon his hitherto sound frame and constitution; and after suffering an attack of the lungs, he caught a violent fever, of which he died on Nov. 10, 1832, in the fifty-sixth year of his age. His body was embalmed, his heart and lungs preserved, and a cast taken from his head and brain. Dr. Troller, German Professor at the University of Havard, delivered a feeling oration over his grave.

SPUTATION, *n. s.* Lat. *sputam*. The act of spitting.

A moist consumption receives its nomenclature from a moist *sputation*, or expectoration: a dry one is known by its dry cough. *Harvey on Consumption*.

SPUTTER, *v. n.* Swed. *sputa*; Lat. *sputo*. To emit moisture in small flying drops; fly out in small particles: hence to speak hastily and obscurely.

If a manly drop or two fall down,
It scalds along my cheeks, like the green wood,
That, *sputtering* in the flame, works outwards into
tears. *Dryden*.

Thou dost with lies the throne invade;
Obtending heaven for whate'er ills befall,
And *sputtering* under specious names thy gall. *Id.*

A pinking owl sat *sputtering* at the sun, and asked him what he meant, to stand staring her in the eyes?
L'Estrange.

They could neither of them speak their rage, and so fell a *sputtering* at one another, like two roasting apples. *Congreve.*

Though he *sputter* through a session,
It never makes the least impression;
Whate'er he speaks for madness goes. *Swift.*

In the midst of caresses, and without the least pretended incitement, to *sputter* out the basest accusations. *Id.*

SPY, *n. s., v. a. & v. n.* Welsh *yspio*; Fr. *espion*; Belg. *spie*; Lat. *speculator*. It is observed by a German that spy has been in all ages a word by which the eye, or office of the eye, has been expressed: thus the Arimaspians of old, fabled to have but one eye, were so called from *ari*, which among the nations of Caucasus still signifies *one*, and *spi*, which has been received from the old Asiatic languages for an *eye, sight*, or one that *sees*.—Johnson. One who watches the conduct of others: one sent to gain intelligence of an enemy's movements; an informer: to search; discover; search narrowly; pry.

Moses sent to *spy* out Jazzar, and took the villages. *Numbers.*

We'll hear poor rogues

Talk of court news, and we'll talk with them too,
And take upon's the mystery of things,
As if we were God's *spies*. *Shakspeare. King Lear.*

It is my nature's plague

To *spy* into abuse; and oft my jealousy
Shapes faults that are not. *Id. Othello.*

Light hath no tongue, but is all eye;

If it could speak as well as *spy*,

This were the worst that it could say,

That being well I fain would stay. *Donne.*

Let a lawyer tell he has *spied* some defect in an entail, how solicitous are they to repair that error!

Decay of Piety.

Every corner was possessed by diligent *spies* upon their master and mistress. *Clarendon.*

As tyger *spied* two gentle fawns. *Milton.*

I come no *spy*,

With purpose to explore, or to disturb,

The secrets of your realm. *Id. Paradise Lost.*

Such command we had,

To see that none thence issued forth a *spy*,
Or enemy, while God was in his work. *Milton.*

Nothing lies hid from radiant eyes;

All they subdue become their *spies*;

Secrets, as chosen jewels, are

Presented to oblige the fair. *Waller.*

Over my men I'll set my careful *spies*,

To watch rebellion in their very eyes. *Dryden.*

My brother Guyomar, methinks, I *spy*;

Haste in his steps, and wonder in his eye. *Id.*

A countryman *spied* a snake under a hedge, half frozen to death. *L'Estrange.*

Those who attend on their state are so many *spies* placed upon them by the publick to observe them nearly. *Atterbury.*

One in reading skipped over all sentences where he *spied* a note of admiration. *Swift.*

SQUAB, *adj.* } Lat. *ex cubito*. Unfeathered;
SQUAB'BISH. } newly hatched: squabbish is, thick; heavy.

Diet renders them of a *squabbish* or lardy habit of body. *Harvey.*

The eagle took the tortoise up into the air, and dropt him down, *squab*, upon a rock, that dashed him to pieces. *L'Estrange.*

Why must old pigeons, and they stale, be drest,
When there's so many *squab* one's in the nest?

King.

The nappy ale goes round;
Nor the *squab* daughter nor the wife were nice,
Each health the youths began, Sim pledged it twice
Betteleton.

SQUAB, *n. s.* Lat. *se cubere*. A kind of sofa or couch; a stuffed cushion.

On her large *squab* you find her spread,
Like a fat corpse upon a bed. *Pepe.*

SQUABPIE', *n. s.* Squab and pie. A pie made of many ingredients.

Cornwal *squabpie*, and Devon whitepot brings;
And Leister beans and bacon, food of kings. *King.*

SQUAB'BLE, *v. n.* Swed. *kiabla*; Teut. *kabelen*, of Goth. *keappa*. To quarrel; to debate peevishly; to wrangle; to fight. A low word.

Drunk? and speak parrot? and *squabble*? swag-gery? oh, thou invincible spirit of wine

Shakspeare. Othello.

I thought it not improper, in a *squabbling* and contentious age, to detect the vanity of confiding ignorance. *Glanville.*

In popular factions, pragmatick fools commonly begin the *squabble*, and crafty knaves reap the benefit. *L'Estrange.*

If there must be disputes, is not *squabbling* less inconvenient than murder? *Collier on Duelling.*

A man whose personal courage is suspected, is not to drive squadrons before him; but may be allowed the merit of some *squabble*, or throwing a bottle at his neighbour's head. *Arbutnot.*

The sense of these propositions is very plain, though logicians might *squabble* a whole day, whether they should rank them under negative or affirmative. *Watts's Logick.*

SQUAD (Fr. *escuade*), a diminutive of squadron, is used in military matters to express any small number of men, horse or foot, that are collected together for the purposes of drill, &c.

To SQUAD, to divide a troop or company into certain parts, in order to drill the men separately or in small bodies, or to put them under the direction and care of some steady corporal or lance corporal. In every well regulated troop, or company, the men are squadded in such a manner that the most minute concern, with respect to the interior economy, can be instantly accounted for.

Aukward SQUAD. The aukward squad consists not only of recruits at drill, but of formed soldiers that are ordered to exercise with them, in consequence of some irregularity under arms. This term has likewise been used, partly in ridicule and partly in reproach, to mark out those officers who are negligent of their duty. An industrious tactician, in the British army, frequently uses the expression in the latter sense.

SQUADRON, *n. s.* } Fr. *escadron*; Ital.
SQUADRONED, *adj.* } *squadrone*; Lat. *quadra-*
tus. A body of men drawn up square: hence any considerable part of an army or fleet: the adjective corresponding.

Nothing the Moors were more afraid of, than in a set battle to fight with *squadrons* coming orderly on. *Knolles.*

Eurimidon then reined his horse, that trotted neighing by;

The king a foot-man, and so scowres the *squadron* orderly. *Chapman.*

Those half-rounding guards
Just met, and closing stood in *squadron* joined.

Milton.

They gladly thither haste; and by a choir
Of *squadroned* angels hear his carol sung. *Id.*

Then beauteous Atys, with Iulus bred,
Of equal age, the second *squadron* led. *Dryden.*

Rome could not maintain its dominion over so
many provinces, without *squadrons* ready equipt.

Arbuthnot.

SQUADRON (Fr. *escadron*), a body of cavalry composed of two troops. The number is not fixed, but is generally from eighty to 120 men. The oldest troop always takes the right of the squadron, the second the left. The most scientific and the most experienced officers have always held the cavalry in high estimation. The services which have been rendered by this body of men; their innumerable successes, of which so many records are preserved both in ancient and modern history, together with the unanimous approbation of those authors who are considered as masters in the art of war; all these circumstances sufficiently evince that cavalry is not only useful but indispensably necessary in war. Marshal Turenne was known to say—*Avec une bonne cavalerie, on travaille l'armée de son ennemie par détail*; with a body of good cavalry one works, or harasses, the army of one's enemy by detail; meaning thereby, that the desultory and rapid movements of dragoons, if properly managed, are of a nature to destroy the best concerted plans of an adversary, by hanging upon his flanks, driving in his outposts, intercepting his convoys, and by taking advantage of every opening during the heat of engagement. The Austrians had a memorable instance of the latter, when the French general Désaix, at the head of a body of horse, decided the fate of the battle of Marengo. In pursuits the superiority of the cavalry is unquestionable.

SQUADRON OF SHIPS either implies a detachment of ships employed on any particular expedition, or the third part of a naval armament.

SQUALID, *adj.* Lat. *squalidus*. Foul; nasty; filthy.

A doleful case desires a doleful song,
Without vain art or curious compliments;
And *squalid* fortune into baseness flowing
Doth scorn the pride of wonted ornaments.

Spenser.

Uncombed his locks, and *squalid* his attire,
Unlike the trim of love and gay desire.

Dryden's Knight's Tale.

'**SQUALL**, *v. n. & n. s.* Swed. *squala*. To scream out as a child or woman frightened; a gust of wind or rain.

In my neighbourhood, a very pretty prattling
shoulder of veal *squalls* out at the sight of a knife.

Spectator.

I put five into my coat-pocket; and, as to the sixth, I made a countenance as if I would eat him alive. The poor man *squalled* terribly. *Swift.*

Cornelius sunk back on a chair; the guests stood
astonished; the infant *squalled*.

Arbuthnot and Pope.

There oft are heard the notes of infant woe,
The short thick sob, loud scream, and shriller *squall*.

Pope.

A **SQUALL** is a violent blast of wind usually occasioned by the interruption and reverberation

of the wind from high mountains. These are very frequent in the Mediterranean, particularly that part of it called the Levant, as produced by the repulsion and new direction which the wind meets with in its passage between the various islands of the Archipelago.

SQUALOR, *n. s.* Lat. *squalor*. Coarseness; nastiness; want of cleanliness and neatness.

Take heed that their new flowers and sweetness
do not as much corrupt as the others dryness and
squalor.

Ben Jonson.

What can filthy poverty give else, but beggary,
fulsome nastiness, *squalor*, ugliness, hunger, and
thirst?

Burton.

SQUALUS, the shark, in ichthyology, a genus arranged by Linnæus under the class of amphibia, and the order of nantes; but by Gmelin more properly referred to the class of pisces, and order of chondropterygii. The head is obtuse; on the sides of the neck there are from four to seven semilunar spiracles. The eyes are oblong, vertical, half covered, and before the foramen temporale. The mouth is situated in the interior and lower part of the head, and is armed with several rows of teeth, which are serrated, acute, partly moveable and partly fixed, and unequal in form. The body is oblong, tapering, and rough, with very tender prickles. The ventral fins are much less than the pectoral, and are situated round the anus and genitals. Sharks are seldom destructive in the temperate regions: it is in the torrid zone that their ravages are most frequent. In the West Indies accidents happen from them daily. During the American war, in 1780, while the Pallas frigate was lying in Kingston Harbour, a young north American jumped overboard one evening to make his escape, and perished by a shark in a shocking manner. He had been captured in a small vessel, lost all his property, and was detained by compulsion in the English navy to serve in a depredatory war against his country. But he, animated with that spirit which pervaded every bosom in America, resolved, as soon as he arrived at some port, to release himself from the mortifying state of employing his life against his country, which, as he said when dying, he was happy to lay down as he could not employ it against her enemies. He plunged into the water; the Pallas was a quarter of a mile from the shore. A shark perceived him, and followed him very quietly till he came near the shore; where, as he was hanging by a rope that moored a vessel to a wharf, scarcely out of his depth, the shark seized his right leg, stripped the flesh entirely from the bones, and took the foot off at the ankle. He still kept his hold, and called to the people in the vessel near him, who were standing on the deck and saw the affair. The shark then seized his other leg, which the man by his struggling disengaged from his teeth, but with the flesh cut through down to the bone into a multitude of narrow slips. The people in the vessel threw billets of wood into the water and frightened the shark away. The young man was brought on shore. Dr. Moseley was called to him; but he had lost so much blood before any assistance could be given him that he expired before the mangled limbs could be taken off. A few weeks before this a shark, of twelve feet in length, was

caught in the harbour; and on being opened the entire head of a man was found in his stomach. The scalp and flesh of the face were macerated to a soft pulpy substance, which, on being touched, separated entirely from the bones. The bones were somewhat softened and the sutures loosened.—Moseley on Tropical Diseases. A very extraordinary instance of intrepidity and friendship is given by Mr. Hughes in his Natural History of Barbadoes. It happened about the end of queen Anne's wars at Barbadoes. The sailors of the York Merchant having ventured into the sea to wash themselves, a large shark made toward them; upon which they swam back, and all reached the boat except one, whom the monster overtook, and gripping him by the small of his back, soon cut him asunder, and swallowed the lower part of his body; the remaining part was taken up and carried on board, where a comrade of his was, whose friendship with the deceased had been long and reciprocal. When he saw the severed trunk of his friend, with a horror and emotion too great for words to paint, he vowed that he would make the devourer disgorge or be swallowed himself in the same grave, and plunged into the deep armed with a sharp-pointed knife. The shark no sooner saw him but he made furiously toward him; both equally eager, the one for his prey the other for revenge. The moment the shark opened his rapacious jaws, his adversary dexterously diving, and grasping him with his left hand somewhat below the upper fins, successfully employed his knife in his right hand, giving him repeated stabs in the belly; the enraged shark, after many unavailing efforts, finding himself overmatched in his own element, endeavouring to disengage himself, sometimes plunging to the bottom, then mad with pain rearing his uncouth form, now stained with his own streaming blood, above the foaming waves. The crews of the surrounding vessels saw the unequal combat, uncertain from which of the combatants the streams of blood issued; till at length the shark, much weakened by the loss of blood, made toward the shore, and with him his conqueror, who, now assured of victory, pushed his foe with redoubled ardor, and, by the help of an ebbing tide, dragged him on shore, ripped up his bowels, and united and buried the severed carcase of his friend. It is evident (says Dr. Moseley) that digestion in these animals is not performed by trituration, nor by the muscular action of the stomach; though nature has furnished them with a stomach of wonderful force and thickness, and far exceeding that of any other creature. Whatever their force of digestion is it has no effect upon their young ones, which always retreat into their stomachs in time of danger. That digestion is not performed by heat in fish is equally evident. The coolness of the stomach of these fishes is far greater than the temperature of the water out of which they are taken; or of any other part of the fish, or of any other substance of animated nature I ever felt. On wrapping one of them round my hand, immediately on being taken out of the fish, it caused so much aching and numbness that I could not endure it long. Of these voracious sea-monsters there are thirty-three species; of which

the following is an exact list, with descriptions of the most remarkable:—

1. *S. acanthias*, the picked dog-fish. There is another species which has the same English name, and probably the same characters.
2. *S. Africanus*, the African shark, or galonue, abounds on the coasts of Africa.
3. *S. Americanus*, the American shark, or liehe, swarms on the coasts of America.
4. *S. barbatus*, the barbu, or bearded shark.
5. *S. canicula*, the greater dog-fish, or spotted shark, is distinguished by large nostrils, which are covered by a lobe and worm-shaped flap, or by the position of the anal fin, which is at an equal distance from the anus and tail. The body is spotted; the head is small, with a short snout; the eyes are oblong; the iris whitish; the mouth is large and oblong, armed with three rows of teeth; the tongue is cartilaginous; the anus is before the middle of the body; the first dorsal fin is behind the ventral fins; the other, which is less, is almost opposite the anal fin; the caudal fin is narrow and margined. This species is found in almost every sea, is about four feet long, extremely voracious, generally feeding on fishes, and is long lived. The skin, which is spotted like a leopard, is used when dried for various purposes.
6. *S. carcharias*, the requiu, or white shark, is often thirty feet long, and, according to Gillius, weighs 4000 lbs. The mouth is sometimes furnished with a six-fold row of teeth, flat, triangular, and exceedingly sharp at their edges, and finely serrated. Mr. Pennant had one rather more than an inch and a half long. Grew says that those in the jaws of a shark two yards in length are not half an inch; so that the fish to which this tooth belonged must have been six yards long, provided the teeth and body kept pace in their growth. This dreadful apparatus, when the fish is in a state of repose, lies quite flat in the mouth; but when he seizes his prey he has power of erecting them by the help of a set of muscles that join them to the jaw. The mouth is placed far beneath; for which reason these, as well as the rest of the kind, are obliged to turn on their backs to seize their prey; which is an observation as ancient as the days of Pliny. The eyes are large; the back broad, flat, and shorter than that of other sharks. The tail is of a semilunar form, but the upper part is larger than the lower. It has vast strength in the tail and can strike with great force; so that the sailors instantly cut it off with an axe as soon as they draw one on board. The pectoral fins are very large, which enables it to swim with great swiftness. The color of the whole body and fins is a light ash. The ancients were acquainted with this fish; and Oppian gives a long and entertaining account of its capture. Their flesh is sometimes eaten, but is esteemed coarse. They are the dread of the sailors in all hot climates, where they constantly attend the ships in expectation of what may drop overboard: a man that has that misfortune perishes without redemption. A master of a Guinea ship informed Mr. Pennant that a rage of suicide prevailed among his new-bought slaves, from a notion the unhappy creatures had, that after death they should be re-

stored again to their families, friends, and country. To convince them at least that they should not re-animate their bodies he ordered one of their corpses to be tied by the heels to a rope and lowered into the sea; and, though it was drawn up again as fast as the united force of the crew could be exerted, yet in that short space the sharks had devoured every part but the feet, which were secured at the end of the cord. Swimmers very often perish by them; sometimes they lose an arm or a leg, and sometimes are bit quite asunder, serving but for two morsels for this ravenous animal: a melancholy tale of this kind is related in a West India ballad, preserved in Dr. Percy's Relics of ancient English poetry. This species inhabits the abyss of the ocean, and only appears on the surface when allured by its prey. It is the most voracious of all animals, not even, it is said, sparing its own offspring, and often swallowing its prey entire. This is probably the species of fish that swallowed the prophet Jonah; for a whale it could not be without an additional miracle.

7. *S. catulus*, the smaller dog-fish, has a large head; the pupil of the eye is black; the iris white; the snout is of a bright hue; the mouth, which is large, is situated between the nostrils, and is armed with four rows of teeth, serrated with three points bent inwards; those in the middle between the two mandibles are longer than the rest. The tongue is broad and smooth; the spiracles are five; the back is tapering and yellowish; the sides are somewhat compressed; the tail longer than the body, and the caudal fin is narrow and marginated; the anterior anal and dorsal fins are behind the ventral; the posterior dorsal fin is opposite to the anal. They inhabit the Mediterranean, Northern, and Indian Ocean, and are two or three feet long.

8. *S. centrina*, the humantun.

9. *S. cinereus*, or the perlon.

10. *S. cirratus*, the curled shark.

11. *S. cornubius*, the por-beagle, or Beaumarish shark.

12. *S. Fernandinus*, the Fernandine shark. This species swarms near Juan Fernandez.

13. *S. Galeus*, the tope.

14. *S. Glaucus*, the blue shark, is about seven feet long. The color of the back is a fine blue; the belly a silvery white; the head is flat; the eyes small and roundish; the teeth are almost triangular, elongated, and pointed, but not serrated. The anus is very near the tail; the anterior dorsal fin is situated before the ventral fins, about the middle of the body, and is almost triangular; the posterior dorsal fin is equal to the anal fin, and is placed nearer the tail; the pectoral fins are large, long, and marginated; and the ventral are blue above and white below; the caudal is blue, divided into two lobes, of which the superior is much longer than the inferior lobe. This species is frequent in every sea, and is fierce; but not very destructive in our seas.

15. *S. griseus*, the griset.

16. *S. Indicus*, the Indian shark, abounds in the Indian Ocean.

17. *S. Isabella* has a wrinkled spotted skin, and the anterior dorsal fin is perpendicular to

the abdominal fins. The body is somewhat flat; the head short, large, and obtuse. The teeth are disposed in six rows, compressed short, and triangular, having a notch on each side of their bases. The eyes are sunk; the iris is of a copper color, and the pupil is black and oblong. The fins of the back are almost square; the caudal fin is divided into two lobes, and the lateral line is parallel to the back. The upper part of the body is of a reddish ash-color, with blackish spots disposed irregularly. The under part is of a dirty white hue. This species is found near New Zealand, and is about two feet and a half long.

18. *S. kumalis*, the kumal.

19. *S. longicaudus*, the long-tailed shark.

20. *S. massasa*, the massasa.

21. *S. maximus*, the basking shark, or the sun-fish of the Irish. This species has been long known to the inhabitants of the south and west of Ireland and Scotland, and those of Caernarvonshire and Anglesey; but is described by no English writer except Mr. Pennant; and has been mistaken for, and confounded with, the luna of Rondeletius, which English writers call the sun-fish. The Irish and Welsh give it the same name, from its lying as if to sun itself on the surface of the water; and for the same reason Mr. Pennant calls it the basking shark. It was long taken for a species of whale, till Mr. Pennant pointed out the bronchial orifices on the sides, and the perpendicular site of the tail. These are migratory fish; in a certain number of years they are seen in multitudes on the Welsh seas, though in most summers a single strayed fish appears. They inhabit the northern seas, even as high as the arctic circle. They visited the bays of Caernarvonshire and Anglesey in vast shoals in the summers of 1756 and a few succeeding years, continuing there only the hot months; for they quitted the coast about Michaelmas. These fish visited these seas in vast numbers about fifty years ago. They appear in the Frith of Clyde and among the Hebrides in June, in small droves of seven or eight, but oftener in pairs. They continue in those seas till the end of July. They have nothing of the fierce and voracious nature of the shark's kind, and are so tame as to suffer themselves to be stroked; they generally lie motionless on the surface, commonly on their bellies, but sometimes on their backs. Their food seems to consist entirely of sea plants, no remains of fish being ever discovered in the stomachs of numbers that were cut up, except some green stuff, the half digested parts of algæ, and the like. Linnaeus says they feed on medusæ. At certain times they are seen sporting on the waves, and leaping with vast agility several feet out of the water. They swim very deliberately, with the dorsal fins above water. Their length is from three to twelve yards, and sometimes longer. Their form is rather slender. The upper jaw is much larger than the lower, and blunt at the end. The tail is very large, and the upper part remarkably longer than the lower. The upper part of the body is of a deep leaden color; the belly white. The skin is rough like shagreen, but less so on the belly. In the mouth, towards the throat, is a

very short sort of whale-bone. The liver is of a great size, but that of the female is the largest; some weigh above 1000 lbs., and yield a great quantity of pure and sweet oil, fit for lamps, and also much used to cure bruises, burns, and rheumatic complaints. A large fish has afforded to the captors a profit of £20. They are viviparous; a young one about a foot in length being found in the belly of a fish of this kind. One found dead on the shore of Loch Ranza in the Isle of Arran measured as follows:—The whole length twenty-seven feet four inches; first dorsal fin three feet; second one foot; pectoral fin four feet; ventral two feet; the upper lobe of the tail five feet; the lower three. They will permit a boat to follow them without accelerating their motion till it comes almost within contact, when a harpooner strikes his weapon into them as near to the gills as possible. But they are often so insensible as not to move till the united strength of two men have forced in the harpoon deeper. As soon as they perceive themselves wounded they fling up their tail and plunge headlong into the bottom; and frequently coil the rope round them in their agonies, attempting to disengage the harpoon by rolling on the ground, for it is often found greatly bent. As soon as they discover that their efforts are in vain they swim away with amazing rapidity, and with such violence that there has been an instance of a vessel of seventy tons having been towed away against a fresh gale. They sometimes run off with 200 fathoms of line, and with two harpoons in them; and will employ the fishers for twelve and sometimes for twenty-four hours before they are subdued. When killed they are either hauled on shore, or, if at a distance from land, to the vessel's side. The liver (the only useful part) is taken out and melted into oil in kettles. A large fish will yield eight barrels of oil, and two of sediment.

22. *S. mustelus*, the smooth hound shark.

23. *S. ocellatus*, the oelle.

24. *S. pristi*, the sole, or saw-fish, is sometimes fifteen feet long, smooth, black on the upper parts, ash-colored on the sides, and white underneath. The head is flat and conical; the beak or snout projecting from the nose is about five feet long, covered with a coriaceous skin, and armed on each side, generally with twenty-four long, strong and sharp-pointed teeth; but the number varies with age. The teeth are granulated; the eyes large, the iris of a golden color, and the spiracles five. The anterior dorsal fin corresponds to those of the belly; the posterior is situated in the middle, between the former and apex of the tail; the pectoral fins are broad and long, the caudal is shorter than in the other species. It inhabits all the seas from Greenland to Brasil; and is found also in the Indian Ocean. It is harmless.

25. *S. spinax*, the sagre, or picked dog-fish, takes its name from a strong and sharp spine placed just before each of the back fins, distinguishing it at once from the rest of the British sharks. The nose is long, and extends greatly beyond the mouth, but is blunt at the end. The teeth are disposed in two rows, are small and sharp, and bend from the middle of each jaw to-

wards the corners of the mouth. The back is of a brownish ash-color; the belly white. It grows to the weight of about twenty pounds. This species swarms on the coasts of Scotland, where it is taken, split, and dried; and is a food among the common people. It forms a sort of inland commerce, being carried on women's backs fourteen or sixteen miles up the country, and sold or exchanged for necessaries.

26. *S. spinosus*, the bouelé, or spinous shark.

27. *S. squamosus*, the ecailleux, or scaly shark.

28. *S. squatina*, the angel-fish, or rather devil-fish, is from six to eight feet long, has a large head, teeth broad at their base, but slender and very sharp above, and disposed in five rows all round the jaws. Like those of all sharks, they are capable of being raised or depressed by means of muscles uniting them to the jaws, not being lodged in sockets as the teeth of cetaceous fish are. The back is of a pale ash-color, and very rough; along the middle is a prickly tuberculated line; the belly is white and smooth. The pectoral fins are very large, and extend horizontally from the body to a great distance: they have some resemblance to wings, whence its name. The ventral fins are placed in the same manner, and the double penis is placed in them; which forms another character of the males in this genus. This species connects the genus of rays and sharks, partaking somewhat of the character of both; yet it is an exception to each in the situation of the mouth, which is placed at the extremity of the head. It is pretty frequent on most of our coasts, where it prowls about for prey. It is extremely voracious; and feeds on flounders and flat fish, which keep at the bottom of the water. It is exceedingly fierce, and dangerous to be approached. Mr. Pennant mentions a fisherman whose leg was terribly torn by a large one of this species, which lay within his nets in shallow water, and which he went to lay hold of incautiously. The aspect of these, as well as the rest of the genus, have much malignity in them; their eyes are oblong, and placed lengthwise in their head, sunk in it, and overhung by the skin, and seem fuller of malevolence than fire. Their skin is very rough; the ancients made use of it to polish wood and ivory, as we do at present that of the greater dog-fish. The flesh is now but little esteemed on account of its coarseness and rankness; yet Archestratus (as quoted by Athenæus, p. 319) speaking of the fish of Miletus, gives this the first place, in respect to delicacy, of the whole cartilaginous tribe. They grow to a great size; being sometimes nearly a hundred weight.

29. *S. stellaris*, the greater cat-fish. The head is marked with points; the abdominal fins are united and sharp at the apex; the dorsal fins extend almost to the tail; the skin is reddish, marked with black spots of different sizes, and is of a dirty ash-color below. It is from two to six feet long; resembles the canicula, but is distinguished by larger and fewer spots, by a snout somewhat longer, a tail somewhat shorter, and nostrils almost shut. The female brings fortynineteen or twenty young at a time. They inhabit the European seas, living chiefly on shell

fish, molluscæ, and other small fishes. The dorsal fins are equal; the anterior one being behind the middle of the body, and the posterior one being a little behind the anal.

30. *S. tiburo*, the pantouffier of Broussonet.

31. *S. tigrinus* is about fifteen feet long; the body is long, of unequal thickness, black, interspersed with white stripes and spots, irregularly and transversely. The head is large; the mouth low and transverse, the upper jaw having two curls; the upper lip is thick and prominent; there are five spiracles on each side, the last two being united so as to give the appearance only of four; the mandibles are armed with very small pointed teeth; the tongue is short and thick; the eyes small and oblong; the pupil azure colored; the iris black. The abdomen is broad; the pectoral fins are broad, and rounded at the extremity. The anterior dorsal fin is opposite to the ventral fins, and the posterior dorsal fin to the anal. The tail is compressed on both sides, and the fin which terminates it is hollow. They are found in the Indian Ocean, and live chiefly on shell fish.

32. *S. vulpes*, the sea-fox, is most remarkable for the great length of its tail, the body being about seven feet long, and the tail six feet. The head is short and conical; the eyes are large; the jaws are armed in a dreadful manner with three rows of triangular, compressed, and pointed teeth; the tongue is blunt; the lateral line is straight, the anterior dorsal fin is placed about the middle of the back; the posterior, which consists of two pointed lobes, is opposite to the anal fin; the ventral fins are very near one another; the anal is acuminate; the inferior lobe of the tail is about a foot long; the upper, which is shaped like a scythe, is five times longer. This species inhabits the Mediterranean, the coast of Scotland and England. It is covered with small scales; its back is ash-colored, belly whitish. It is extremely voracious. The ancients styled this fish $\alpha\lambda\omega\pi\eta\chi\epsilon\iota$, and *vulpes*, from its supposed cunning. They believed that when it had the misfortune to have taken a bait, it swallowed the hook till it got at the cord, which it bit off and so escaped.

33. *S. zyæna*, the marteau, or balance-fish, is frequently six feet long, and weighs 500 lbs. The head is elongated on each side; the fore part is bent back, and convex both above and below. At the extremities of the elongated part are the eyes, which are large, prominent and directed downwards; the iris is of a golden color; the mouth is arched, and near the beginning of the trunk. It has a horrible appearance from the teeth, which are arranged in three or four rows, and are broad pointed, and serrated on both sides. The tongue is thick, broad, and like a man's. The trunk is long and tapering; the fins are semicircular on the margin, and black at the basis; the ventral fins are separate; the anal and posterior dorsal fins are small; the anterior dorsal fin is large, and near the head; the caudal is long. This species inhabits the Mediterranean Sea and the Indian Ocean. It is one of the most voracious of the whole tribe.

SQUAMARIA, in botany. See LATHRÆA.

SQUAMOSA RADIX. See BOTANY.

SQUAMOUS, *adj.* Lat. *squamæus*. Sealy; covered with scales.

The sea was replenished with fish of the cartilaginous and *squamosæ*, as of the testaceous and crustaceous kinds.

Woodward.

Those galls and balls are produced in the gems of oak, which may be called *squamous oak cones*.

Derham's *Physico-Theology*.

SQUAMOUS, in anatomy, an epithet applied to the spurious or false futures of the skull, because composed of squamæ, or scales like those of fishes.

SQUANDER, *v. a.* } Saxon *scendan*;
SQUANDERER, *n. s.* } Teut. *schwenden*. To scatter lavishly; to spend profusely; to throw away in idle prodigality; scatter: a spendthrift; prodigal; lavish.

He hath an argosie bound to Tripolis, another to the Indies, and other ventures he hath squandered abroad.

Shakspeare.

The troops we squandered first again appear
From several quarters, and inclose the rear.

Dryden

Plenty in their own keeping teaches them from the beginning to be squanderers and wasters. Locke.

They often squandered, but they never gave.

Swille.

We squander away some part of our fortune at play.

Atterbury.

How uncertain it is, whether the years we propose to ourselves shall be indulged to us; uncertain whether we shall have power, or even inclination, to improve them better than those we now squander away.

Rogers.

True friends would rather see such thoughts as they communicate only to one another, than what they squander about to all the world.

Pope.

Never take a favourite waiting-maid, to insinuate how great a fortune you brought, and how little you are allowed to squander.

Swift.

SQUARCIONE (Francis), an eminent Italian painter, born in 1394. He formed his taste on the finest antiques. For that purpose he travelled into Greece, where he copied the relics of antiquity. On his return to Italy he obtained the highest reputation, insomuch that he was styled the father of painting. He died in 1474.

SQUARE, *adj.*, *n. s.*, *v. a.*, } Welsh *ysgwâr*;

SQUARENESS, *n. s.* [& *v. n.*] Italian *quadra*; Span. *esquadra*, of Lat. *quadratus*. Rectangular; cornered; parallel; suitable; strong; compact: a figure of this kind; the area of the figure; content of an angle; rule; regularity; for a square number, see below; quaternion; the number four; the astrological situation of planets distant 90°: to square is, to form into a square or into right angles: hence to adjust; measure; fit: as a verb neuter, suit or fit with; also to oppose; go to opposite sides (obsolete): squareness is the state of being square.

All the doors and posts were square, with the windows.

Kings

Catching up in haste his three square shield,
And shining helmet, soon him buckled to the field.

Spenser.

Then did a sharped spire of diamond bright;
Ten feet each way, in square appear to me,
Justly proportioned up into his height,
So far as archer might his level see.

Id.

The whole ordinance of that government was at first evil plotted, and through other oversights came

more out of *square*, to that disorder which it is now come unto. *Id. Ireland.*

In St. Paul's time the integrity of Rome was famous; Corinth many ways reprov'd; they of Galatia much more out of *square*. *Hooker.*

She's a most triumphant lady, if report be *square* to her. *Shakespeare.*

All have not offend'd;

For those that were, it is not *square* to take On those that are, revenge; crimes like to lands Are not inherit'd. *Id. Timon of Athens.*

He alone

Dealt on lieutenantry, and no practice had In the brave *squares* of war. *Shakespeare.*

I profess

Myself an enemy to all other joys Which the most precious *square* of sense possesses, And find I am alone felicitate In your dear love. *Id.*

Stubborn criticks, apt, without a theme For depravation, to *square* all the sex By Cressid's rule. *Id.*

How frankly I *square* my talk! *Id.*

Are you such fools

To *square* for this? would it offend you then That both should speed? *Id. Titus Andronicus.*

Nothing so much setteth this art of influence out of *square* and rule as education. *Raleigh.*

God has design'd us a measure of our undertakings; his word and law, by the proportions whereof we are to *square* our actions. *Decay of Piety.*

The oracle was enforced to proclaim Socrates to be the wisest man in the world; because he apply'd his studies to the moral part, the *squaring* men's lives. *Hammond.*

O'er Libra's sign a crowd of foes prevails, The icy goat and crab that *square* the scales. *Creech.*

Raised of grassy turf their table was; And on her ample *square* from side to side All autumn pided. *Milton.*

To the' other five

Their planetary motions and aspects, In sextile, *square*, and trine, and opposite, Of noxious efficacy. *Id. Paradise Lost.*

Eye me, blest providence, and *square* my trial To my proportioned strength. *Milton.*

In rectangle triangles the *square* which is made of the side that subtendeth the right angle is equal to the *squares* which are made of the sides containing the right angle. *Broune.*

He employs not on us the hammer and the chizzel, with an intent to wound or mangle us, but only to *square* and fashion our hard and stubborn hearts. *Boyle's Seraphick Love.*

We live not on the *square* with such as these, Such are our betters who can better please. *Dryden.*

His preaching much, but more his practice wrought;

A living sermon of the truths he taught: For this by rules severe his life he *squared*, That all might see the doctrine which they heard. *Id.*

Men should sort themselves with their equals; for a rich man that converses upon the *square* with a poor man, shall certainly undo him. *L'Estrange.*

I shall break no *squares* whether it be so or not. *Id.*

This instrument is for striking lines *square* to other lines or straight sides, and try the *squareness* of their work. *Moxon.*

Some professions can equally *square* themselves to, and thr^{ve} under, all revolutions of government. *South.*

The statue of Alexander VII. stands in the large *square* of the town. *Addison on Italy.*

Water and air the varied form confound; The straight looks crooked, and the *square* grows round. *Prior.*

Circles to *square*, and cubes to double, Would give a man excessive trouble. *Id.*

His description *squares* exactly to lime. *Woodward.*

These marine bodies do not *square* with those opinions, but exhibit phænomena that thwart them. *Id.*

Advance thy golden mountains to the skies, On the broad base of fifty thousand rise: Add one round hundred; and, if that's not fair, Add fifty more, and bring it to a *square*. *Pope.*

This must convince all such who have, upon a wrong interpretation, presumed to *square* opinions by theirs, and have in loud exclamations shewn their abhorrence of university education. *Swift.*

Motion, *squareness*, or any particular shape, are the accidents of body. *Watts's Logick.*

SQUARE, in geometry, a quadrilateral figure both equilateral and equiangular. See **GEO-METRY**.

SQUARE, among mechanics, an instrument consisting of two rules or branches, fastened perpendicularly at one end of their extremities, so as to form a right angle. It is of great use in the description and mensuration of right angles, and laying down perpendiculars.

SQUARE, HOLLOW, in the military art, body of foot drawn up with an empty space in the middle, for the colors, drums, and baggage, faced and covered by the pikes every way, to keep off the horse.

SQUARE NUMBER is the product arising from a number multiplied by itself. Thus 4 is the square of 2, and 16 the square of 4.

The series of square integers is . . . 1, 4, 9, 16, 25, 36, &c. which are the squares of 1, 2, 3, 4, 5, 6, &c. Or the square fractions $\frac{1}{4}, \frac{9}{16}, \frac{25}{36}, \frac{36}{49}, \frac{49}{64},$ &c. which are the squares of $\frac{1}{2}, \frac{3}{4}, \frac{5}{6}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5},$ &c.

Square numbers have remarkable properties, of which the following are some of the most interesting, viz.—1. Every square number is of one of the forms $4n$ or $4n + 1$; that is, every square, when divided by 4, will leave either 0 or 1 for a remainder; and, understanding this expression still in the same sense, the following table will express the terms of square numbers to the moduli or divisors, 3, 4, 5, 6, 7, 8, 9, 10, 11, and 12.

Moduli:	Possible Forms of Squares.					
3	3n	3n + 1				
4	4n	4n + 1				
5	5n	5n ± 1				
6	6n	6n + 1	6n + 3	6n + 4		
7	7n	7n + 1	7n + 2	7n + 4		
8	8n	8n + 1	8n + 4			
9	9n	9n + 1	9n + 4	9n + 7		
10	10n	10n ± 1	10n ± 4	10n ± 5		
11	11n	11n + 1	11n + 3	11n + 5	11n + 9	
12	12n	12n + 1	12n + 4	12n + 9		

2. Hence, by exclusion, we may derive the following table of impossible forms, viz.

Moduli.	Impossible Forms for Squares.				
3	$3n+2$				
4	$4n+2$	$4n+3$			
5	$5n+2$	$5n+3$			
6	$6n+2$	$6n+5$			
7	$7n+3$	$7n+5$	$7n+6$		
8	$8n\pm 2$	$8n\pm 3$	$8n+7$		
9	$9n+2$	$9n\pm 3$	$9n+5$	$9n+8$	
10	$10n\pm 2$	$10n\pm 3$			
11	$11n+2$	$11n+6$	$11n+7$	$11n+8$	$11n+10$
12	$12n\pm 2$	$12n+3$	$12n\pm 5$	$12n+6$	$12n+8$
	$12n+10$				

These formulæ, as they involve no higher power of the indeterminate n than the first, are called linear forms; but, by means of them, we easily arrive at a variety of quadratic formulæ, which it is extremely useful to be acquainted with, in practising the diophantine or indeterminate analysis. A person unacquainted with these exclusions, required to find two such numbers, that double the square of one, added to triple the square of the other, should be a square, would see nothing impossible in the proposition, and might therefore lose many useless hours in the research; whereas, by a little attention to the impossible and possible forms, he would find the problem absolutely impossible, and hence spare himself much useless labor.

3. The method of deducing impossible quadratic forms from the linear ones above given will be seen immediately from a single example. Let it be required to ascertain whether the equation $2x^2 + 3y^2 = w^2$ be possible or impossible. First, we may assume $x, y,$ and $w,$ prime to each other; for, if x and y have a common divisor, w must have the same, and the whole equation may be divided by it; whereby it will be reduced to another equation $2x'^2 + 3y'^2 = w'^2$, in which these quantities have no longer a common divisor, or in other words they are prime to each other.

Since, then, x and y are prime to each other, they cannot be both of the form $3n$; for, in this case, they would have a common divisor 3. Let then, first, x^2 be of the form $3n$, and y^2 of the form $3n' + 1$; then $2x^2$ is of the form $3n'$, and $3y^2$ of the form $3n'' + 3$, and consequently their sum will have the form $3n$, which is impossible, because, in this case, w and x would have a common divisor 3; and, if we suppose x^2 of the form $3n + 1$, and y^2 of the form $3n$, then $2x^2 + 3y^2$ is of the form $3n + 2$, which is an impossible form: and, lastly, if we assume both of the form $3n + 1$, then $2x^2 + 3y^2$ would have again the same impossible form $3n + 2$; therefore, in no case can $2x^2 + 3y^2 = w^2$ be possible in integral numbers.

In the same manner a variety of other impossible forms may be deduced, of which the following are those which most commonly occur.

5. Modulus 3.

$$\begin{aligned} 2t^2 + 3u^2 &= w^2 \\ 5t^2 + 3u^2 &= w^2 \\ 8t^2 + 3u^2 &= w^2 \\ (3p + 2)t^2 + 3u^2 &= w^2 \end{aligned}$$

6. Modulus 5.

$$\begin{aligned} 2p^2 \pm 5u^2 &= w^2 \\ 3p^2 \pm 5u^2 &= w^2 \\ 7t^2 \pm 5u^2 &= w^2 \\ (5p \pm 2)t^2 \pm 5u^2 &= w^2 \end{aligned}$$

Or the two latter general forms may be rendered more comprehensive, by the introduction of another indeterminate q ; observing only that, in this case, the quantity must always be prime to the modulus. With this condition the two latter may be written thus:—

$$\begin{aligned} (3p + 2)t^2 + 3qu^2 &= w^2, \text{ and} \\ (5p \pm 2)t^2 \pm 5qu^2 &= w^2. \end{aligned}$$

7. Modulus 7.

$$\begin{aligned} (7p + 3)t^2 \pm 7qu^2 &= w^2 \\ (7p + 5)t^2 \pm 7qu^2 &= w^2 \\ (7p + 6)t^2 \pm 7qu^2 &= w^2 \end{aligned}$$

8. Modulus 11.

$$\begin{aligned} (11p + 2)t^2 \pm 11qu^2 &= w^2 \\ (11p + 6)t^2 \pm 11qu^2 &= w^2 \\ (11p + 7)t^2 \pm 11qu^2 &= w^2 \end{aligned}$$

9. Modulus 13.

$$\begin{aligned} (13p \pm 2)t^2 \pm 13qu^2 &= w^2 \\ (13p \pm 5)t^2 \pm 13qu^2 &= w^2 \\ (13p \pm 6)t^2 \pm 13qu^2 &= w^2 \\ (13p \pm 7)t^2 \pm 13qu^2 &= w^2 \end{aligned}$$

10. Modulus 17.

$$\begin{aligned} (17p \pm 3)t^2 \pm 17qu^2 &= w^2 \\ (17p \pm 5)t^2 \pm 17qu^2 &= w^2 \\ (17p \pm 6)t^2 \pm 17qu^2 &= w^2 \\ (17p \pm 7)t^2 \pm 17qu^2 &= w^2 \end{aligned}$$

A great variety of impossible forms might have been given to other moduli; but the above are sufficient for our present purpose.

There are also many formulæ, which, though possible singly, become impossible in pairs; such are the following:—

$$\begin{aligned} 11. \begin{cases} x^2 + y^2 = z^2 \\ x^2 - y^2 = w^2 \end{cases} & \quad 12. \begin{cases} x^2 + y^2 = 2w^2 \\ x^2 - y^2 = 2w^2 \end{cases} \\ 13. \begin{cases} 2x^2 + y^2 = z^2 \\ 2x^2 - y^2 = w^2 \end{cases} & \quad 14. \begin{cases} x^2 + 2y^2 = 2z^2 \\ x^2 - 2y^2 = 2w^2 \end{cases} \\ 15. \begin{cases} x^2 + 2y^2 = z^2 \\ x^2 - 2y^2 = w^2 \end{cases} & \quad 16. \begin{cases} 2x^2 + y^2 = 2z^2 \\ 2x^2 - y^2 = 2w^2 \end{cases} \end{aligned}$$

These might also be carried to a much greater extent and many collateral properties drawn from them relative to the impossibility of some higher powers; we must not, however, carry the subject farther in this place. The reader who is desirous of more detailed information may consult Barlow's Elementary Investigation of the Theory of Numbers, where this part of the doctrine of Numbers is carried to a considerable extent. We shall merely select a few other distinct properties of squares, as they are given by the same author in his Mathematical Dictionary.

17. The sum of two odd squares cannot be a square.

18. An odd square, taken from an even square, cannot leave a square remainder.

19. If the sum of two squares be itself a square, one of the three squares is divisible by 5.

20. Square numbers must terminate in one of the digits 0, 1, 4, 5, 6, or 9.

21. No number of repetend digits can be a square.

22. The area of a rational right-angled triangle cannot be equal to a square.

23. The two following series are remarkable for being such as, when reduced to improper fractions, the sum of the squares of each numerator and denominator is a complete square; or, which is the same, they are the sides of rational right-angled triangles. These series are as follow, viz. :—

$$1\frac{1}{2}, 2\frac{3}{10}, 3\frac{3}{10}, 4\frac{3}{10}, 5\frac{3}{10}, \&c. \&c.$$

$$1\frac{1}{8}, 2\frac{11}{16}, 3\frac{11}{8}, 4\frac{11}{8}, 5\frac{11}{4}, \&c. \&c.$$

24. The second differences of consecutive square numbers are equal to each other, thus:—

Squares	1, 4, 9, 16, 25, &c.
First difference	3, 5, 7, 9, &c.
Second difference	2, 2, 2, &c.

To these we may also add the following; which are more particularly applicable to the indeterminate and diophantine analysis.

25. If a number be the sum of two squares, its double is also the sum of two squares; for $(x^2 + y^2) \times 2 = (x + y)^2 + (x - y)^2$.

Hence also the sum of two squares, multiplied by any power of 2, is the sum of two squares.

26. The product of two numbers, each being the sum of two squares, is itself the sum of two squares; for

$$(x^2 + y^2) \times (x'^2 + y'^2) =$$

$$\{ (x x' + y y')^2 + (x y' - x' y)^2, \text{ or}$$

$$\{ (x x' - y y')^2 + (x y' + x' y)^2$$

Thus, $5 = 2^2 + 1^2$
 $13 = 3^2 + 2^2$

Product $65 = 8^2 + 1^2$ or $7^2 + 4^2$

27. The product of the sum of four squares, by the sum of four other squares, is itself the sum of four squares; thus:—

$$(w^2 + x^2 + y^2 + z^2) \times (w'^2 + x'^2 + y'^2 + z'^2) =$$

$$\{ (w w' + x x' + y y' + z z')^2 + (w x' - x w')^2 +$$

$$\{ (y w' - x z' - y w' + z x')^2 + (w z' + x y' - y x' - z w')^2$$

as will appear by the development of these formulæ.

28. Every integral number is either a square, or the sum of two, three, or four squares. The latter is one of the celebrated numerical theorems of Fermat, first demonstrated by Lagrange.

SQUARE MEASURES, the squares of the lineal measures; as in the following table of square measures:—

Square Inches.	Square Feet.	Sq. Yards.	Sq. Poles.	S. Chs.	Acres.	S. Miles
144	1					
1296	9					
39204	272 $\frac{1}{4}$	30 $\frac{1}{4}$	1			
627264	4356	484	16	1		
6272640	43560	4840	160	10	1	
4014489600	27878400	3097600	102400	6400	640	1

SQUARE ROOT. See ALGEBRA.

SQUARE-RIGGED, an epithet applied to a ship whose yards are very long. It is also used in contradistinction to all vessels whose sails are extended by stays or lateen-yards, or by booms and gaffs; the usual situation of which is nearly in the plane of the keel; and hence,

SQUARE-SAIL, is a sail extended to a yard which hangs parallel to the horizon, as distinguished from the other sails which are extended by booms and stays placed obliquely. This sail is only used in fair winds, or to scud under in a tempest. In the former case, it is furnished with a large additional part called the bonnet, which is then attached to its bottom, and removed when it is necessary to scud. See SCUDDING.

SQUARING THE CIRCLE is the making or finding a square whose area shall be equal to that of any proposed circle. See QUADRATURE. This problem has never yet been solved so as to be precisely exact; but mathematicians, it is said, can come so near it as not to err so much in the area as a grain of sand would cover in a circle, whose diameter is equal to the diameter of Sa-

turn's orbit. The following proportions are near enough to the truth for any real use that can arise from this problem. As 100000000 is to the diameter of the given circle, so is 88622692 to the side of the square required. Therefore,

If the Diameter of the Circle be	The Side of the Square will be
100000000	88622692
10000000	8862269.2
1000000	886226.92
100000	88622.692
10000	8862.2692
1000	886.22692
100	88.622692
10	8.8622692
1	0.88622692

And as 100000000 is to the side of a given square, so is 112837917 to the diameter of a circle very nearly equal to the square. Therefore,

If the Side of the Square be	The Diameter of the Circle will be
100000000	112837917
10000000	11283791·7
1000000	1128379·17
100000	112837·917
10000	11283·7917
1000	1128·37917
100	112·837917
10	11·2837917
1	1·12837917

SQUASH, *n. s.* From quash. Any thing soft and easily crushed: hence perhaps the plant of this name: any thing unripe; a sudden fall or shock.

Not yet old enough for a man, nor young enough for a boy; as a *squash* is before it is a peascod, or a codling when it is almost an apple.

Shakspeare. Twelfth Night.

How like I then was to this kernel,
This *squash*, this gentleman. *Id. Winter's Tale.*
Since they will overload my shoulders, I shall
throw down the burden with a *squash* among them.

Arbutnot.

My fall was stopped by a terrible *squash*, that sounded louder than the cataract of Niagara.

Swift.

Squash is an Indian kind of pumpion that grows apace.

Boyle.

SQUAT, *v. n. & adj.* Ital. *quattare*. To sit covering; sit close to the ground; covering; close to the ground.

Bruises, *squats*, and falls, which often kill others, can bring little hurt to those that are temperate.

Herbert.

Him there they found,
Squat like a toad close at the ear of Eve. *Milton.*

A stitch-fallen cheek that hangs below the jaw;
Such wrinkles as a skilful hand would draw
For an old grandam ape, when with a grace
She sits at *squat*, and scrubs her leathern face.

Dryden.

The squill-insect is so called from some similitude to the squillfish: the head is broad and

Grew.

Alma in verse, in prose the mind,
Throughout the body, *squat* or tall,
Is bona fide all in all.

Prior.

Her dearest comrades never caught her
Squat on her hams. *Swift.*

SQUAT, *n. s.* From the adjective probably. A sort of mineral; a flat thin bed of ore.

The *squat* consists of tin ore and spar incorporated.

Woodward.

SQUATINA. See **SQUALUS**.

SQUEAK, *v. n. & n. s.* Swed. *sqwaka*. To set up a sudden dolorous cry; to cry out with pain; to cry with a shrill acute tone: a shrill cry; a cry of pain.

The sheeted dead
Did *squeak* and gibber in the Roman streets.

Shakspeare.

Cart wheels *squeak* not when they are liquored.

Bacon.

I see the new Arion sail,
The lute still trembling underneath thy nail:
At thy well sharpened thumb from shore to shore,
The trebles *squeak* for fear, the bases roar. *Dryden.*

Blunderbusses, planted in every loop-hole, go off at the *squeaking* of a fiddle, and the thrumming of a guitar. *Id.*

Ran cow and calf, and family of hogs,
In panick horror of pursuing dogs:
With many a deadly grunt and doleful *squeak*,
Poor swine! as if their pretty hearts would break.

Id.

Who can endure to hear one of the rough old Romans *squeaking* through the mouth of an enunch?

Addison.

How like brutes organs are to ours;
They grant, if higher powers think fit,
A bear might soon be made a wit;
And that, for any thing in nature,
Pigs might *squeak* love-odes, dogs bark satire.

Prior.

In florid impotence he speaks,
And, as the prompter breathes, the puppet *squeaks*.

Pope.

Zoilus calls the companions of Ulysses the *squeaking* pigs of Homer.

Id. Odyssey.

SQUEA'MISH, *adj.* } For quawmish, or
SQUEA MISHLY, *adv.* } qualmish, from qualm.
SQUEA'MISHNESS, *n. s.* } Nice; fastidious; easily disgusted; apt to take offence. It is used always in dislike either real or ironical: the adverb and noun substantive correspond.

Yet, for countenance sake, he seemed very *squamish* in respect of the charge he had of the princess Pamela.

Sidney.

Quoth he, that honour's very *squeamish*,
That takes a basting for a blemish;

For what's more honourable than scars,
Or skin to tatters rent in wars?

Hudibras.

Upon their principles they may revive the worship of the host of heaven; it is but conquering a little *squeamishness* of stomach.

Stillingfleet.

There is no occasion to oppose the ancients and the moderns, or to be *squeamish* on either side. He that wisely conducts his mind in the pursuit of knowledge, will gather what lights he can from either.

Locke.

It is rare to see a man at once *squeamish* and voracious.

South.

The thorough-paced politician must laugh at the *squeamishness* of his conscience, and read it another lecture.

Id.

To administer this dose, fifty thousand operators, considering the *squeamishness* of some stomachs, and the peevishness of young children, is but reasonable.

Swift.

His muse is rustick, and perhaps too plain
The men of *squeamish* taste to entertain.

Southern.

SQUEEZE, *v. a., v. n. & n. s.* Sax. *epiran*; Teut. *quetschen*; Welsh *ysgwasgu*. To press, crush between two bodies: to act in consequence of compression; force a way: compression; pressure.

It is applied to the *squeezing* or pressing of things downwards, as in the presses for printing. *Wilkins.*

He reaped the product of his laboured ground,
And *squeezed* the combs with golden liquor crowned

Dryden.

In a civil war people must expect to be crushed and *squeezed* toward the burden.

L'Estrange.

Many a public minister comes empty in; but, when he has crammed his guts, he is fain to *squeeze* hard before he can get off.

Id.

A subtle artist stands with wondrous bag,
That bears imprisoned winds, of gentler sort
Than those that erst *L'aertes'* son enclosed:
Peaceful they sleep; but let the tuneful *squeeze*

Of labouring elbow rouse them, out they fly
Melodious, and with spritely accents charn.

Philips.

The sinking of the earth would make a convulsion of the air, and that crack must so shake or squeeze the atmosphere as to bring down all the remaining vapours.

Burnet.

A concave sphere of gold filled with water and soldered up, upon pressing the sphere with great force, let the water squeeze through it, and stand all over its outside in multitudes of small drops, like dew, without bursting or cracking the body of the gold.

Newton's Opticks.

What crowds of these, impetuously bold,
In sounds and jingling syllables grown old,
Still run on poets, in a raging vein,
Even to the dregs and squeezings of the brain.

Pope.

SQUELCH, *n. s.* From QUASH. Heavy fall.
A low ludicrous word.

He tore the earth which he had saved
From squelch of knight, and stormed and raved.

Hudibras.

So soon as the poor devil had recovered the squelch,
away he scampers, bawling like mad. *L'Estrange.*

SQUIB, *n. s.* Ital. *schippo*. A small pipe of paper filled with wild fire: any petty fellow.

Asked for their pass by every squib,
That list at will them to revile or snib.

Spenser.

The armada at Calais, Sir Walter Raleigh was
wont prettily to say, were suddenly driven away with
squibs; for it was no more than a stratagem of fire-
boats manless, and sent upon them.

Bacon's War with Spain.

The forest of the south compareth the French valour
to a squib, or fire of flax, which burns and crackles for
a time, but suddenly extinguishes.

Howel's Vocal Forest.

Lampoons, like squibs, may make a present blaze;
But time, and thunder, pay respect to bays.

Waller.

The squibs, in the common phrase, are called li-
bellers.

Tatler.

Furious he begins his march,
Drives rattling o'er a brazen arch;
With squibs and crackers armed, to throw
Among the trembling crowd below.

Swift.

SQUILL, *n. s.* Fr. *squille*; Lat. *squilla*, *scilla*.
A plant; a fish; an insect.

Seed or kernels of apples and pears, put into a
squill, which is like a great onion, will come up
earlier than in the earth itself.

Bacon's Natural History.

'Twill down like oxymel of squills. *Roscommon.*

The self-same atoms

Can, in the truffle, furnish out a feast;
And nauseate, in the scaly squill, the taste.

Garth.

It hath a large acrid bulbous root, like an onion;
the leaves are broad; the flowers are like those of or-
nithogalum, or the starry hyacinth: they grow in
a long spike, and come out before the leaves.

Miller.

The squill insect is so called from some similitude
to the squill fish, in having a long body covered with
a crust, composed of several rings; the head broad
and squat.

Grew.

SQUILL, in botany. See SCILLA.

SQUILLA, the name of a species of cancer.
See CANCER.

SQUINANCY, *n. s.* Fr. *squinance*, *squinancie*;
Ital. *squinantia*. An inflammation in the throat;
a quinsy.

Used for squinancies and inflammations of the
throat, it seemeth to have a mollifying and lenifying
virtue.

Bacon.

In a squinancy there is danger of suffocation.

Wiseman.

SQUINT, *adj., v. n. & v. a.* } Belg. *squinte*,
SQUINT'EYED, *adj.* } oblique, trans-
SQUINTIFÉGO, } verse. Looking
SQUIN'Y, *v. n.* } obliquely; looking
not directly; looking suspiciously: to look ob-
liquely; to form or turn the eye obliquely: the
two adjectives both mean having the sight ob-
lique: to squiny is to look askant or obliquely.

He was so squinteyed that he seemed spitefully to
look upon them whom he beheld.

Knolles's History of the Turks.

I remember thine eyes well enough:

Dost thou squiny at me? *Shakspeare. King Lear.*

This is the foul Filbertigibbet; he gives the web
and the pin, squints the eye, and makes the hairlip.

Shakspeare.

Some can squint when they will; and children set
upon a table, with a candle behind them, both eyes
will move outwards, to seek the light, and so induce
squinting.

Bacon.

Perkin began already to squint one eye upon the
crown, and another upon the sanctuary.

Id. Henry VII.

This is such a false and squinteyed praise,
Which, seeming to look upwards on his glories,
Looks down upon my fears.

Denham.

Where an equal poise of hope and fear
Does arbitrate the event, my nature is
That I incline to hope rather than fear,
And gladly banish squint suspicion.

Milton.

The timbrel and the squintifego maid
Of Isis awe thee; lest the gods, for sin,
Should with a swelling dropsy stuff thy skin.

Dryden.

Not a period of this epistle but squints towards
another over against it.

Pope.

SQUINTING, or Strabismus, an affection of
the eyes, occasioned by the optic axis not con-
verging; in consequence of which the organs of
sight appear distorted. Improper habits fre-
quently induce this defect, while the eye and its
muscles are perfect; for instance, in children,
who accustom themselves to view different things
at one time; or who are placed obliquely towards
any object that may attract their attention. Another
cause is malconformation of the retina, or
such parts as serve to convey impressions to the
point of vision; so that persons thus situated are
obliged to turn the eye from the object to be in-
vestigated, in order that they may be enabled to
behold it more distinctly.—Farther, it often pro-
ceeds from weakness or defect of either eye, so
that both cannot be mutually employed. Be-
sides, it may be consequent on affections of the
brain, epilepsy, terror, and defluxions of rheu-
matic humors.

The method of cure to be adopted in this un-
pleasant distortion varies according to the cause.
Thus, in children, and in cases of weakness of
the eyes, it may be remedied by mechanical con-
trivances. Hence, when there is no organic de-
fect in either eye, which is frequently the case
with persons who squint from a depraved habit of
moving their eyes, the disease may often be cured.

Dr. Darwin remarks (*Philosophical Transac-*

tions, vol. lxxviii.), that in all the squinting people he had occasion to attend, one eye was less perfect than the other; these patients are, in his opinion, certainly curable, by covering the best eye many hours in the day; as, by a more frequent use of the weak eye, it not only acquires a habit of turning to the objects which the patient wishes to see, but gains at the same time a more distinct vision: in both these respects, the better eye is under some disadvantage, which also facilitates the cure. This ingenious physician relates, in the same paper, a remarkable case of a boy, then five years old (now or lately a reputable English clergyman at Edinburgh), who had the misfortune of viewing every object with one eye only at a time. Dr. Darwin directed a paper gnomon to be made, and affixed to a cap; and when this artificial nose was placed over the patient's real nose, so as to project an inch between his eyes, the child, rather than turn his head so far to look at oblique objects, immediately began to exert the eye which was nearest to them. But, having the misfortune to lose his father, soon after this method was begun to be followed, the child was neglected for six years, during which time the habit was confirmed in such a manner as seemed to leave little room to hope for a cure. Dr. Darwin, however, being again called, attempted a second time to remove the deformity, by a similar contrivance. A gnomon of thin brass was made, to stand over his nose, with a half-circle of the same metal to go round his temples: these were covered with black silk; and, by means of a buckle behind his head, and a cross-piece over the crown of his head, this gnomon was worn without any inconvenience, and projected before his nose about two inches and a half. By the use of this machine, he soon found it less inconvenient to view all oblique objects with the eye next to them, instead of the eye opposite to them. After this habit was weakened, by a week's use of the gnomon, two bits of wood, about the size of a goose-quill, were blackened all but a quarter of an inch at their summits; these were frequently presented to him to look at; one being held on one side the extremity of his black gnomon, and the other on the opposite. In viewing these, they were gradually brought forward beyond the gnomon, and then one was concealed behind the other: by such means, in another week, he could bend both his eyes on the same object for half a minute together; and, by continuing the use of the same machine, he was in a fair way of being cured.

Lastly, if squinting arise from any adventitious circumstance, such as terror, defluxions of humors, &c., the removal of those causes will also cure the disorder; but, where it originates from mal-conformation of the organs of vision, or has been so long neglected as to become confirmed, it is not in the power of art to afford any relief. See MEDICINE.

SQUIRE, *n. s.* Contraction of esquire. *Fr. escuyer.* See **ESQUIRE**. A gentleman next in rank to a knight.

He will maintain you like a gentlewoman.—Ay, that I will, come cut and long tail under the degree of a *squire*. *Shakspeare.*

The rest are princes, barons, knights, *squires*,
And gentlemen of blood. *Id. Henry V.*

Return with her!—I could as well be brought
To knee his throne, and *squire*-like pension beg,
To keep base life a-foot. *Id. King Lear.*

Old Butes' form he took, Anchises' *squire*,
Now left to rule Ascanius. *Dryden's Æneid.*
Knights, *squires*, and steeds, must enter on the
stage. *Pope.*

SQUIRE (Samuel), D. D. and F. R. S. &c., a late eminent English prelate, born at Warminster, in Wilts, in 1714, and educated at St. John's College, Cambridge, of which he became a fellow. His father was an apothecary. In 1749 he graduated, and was made rector of Toppfield; in 1750 rector of St. Anne, Westminster; in 1760 dean of Bristol; and in 1761 bishop of St. David's. He died May 7th, 1766. He was a fellow of the Royal and Antiquarian Societies, and a constant attendant. His chief works are, 1. An Enquiry into the Nature of the English Constitution, or an Historical Essay on the Anglo-Saxon Government. 2. The Ancient History of the Hebrews vindicated; Cambridge, 1741. 3. Two Essays: i. A Defence of the Ancient Greek Chronology; ii. An Enquiry into the Origin of the Greek Language; Cambridge, 1741. 4. An Essay on the Balance of Civil Power in England, 1742. 5. Plutarchi de Iside et Osiride liber, 1744.

SQUIR'REL, *n. s.* *Fr. escurreuil; Lat. sciurus.* A small animal that lives in woods, remarkable for leaping from tree to tree.

One chanced to find a nut,
In the' end of which a hole was cut,
Which lay upon a hazel-root,
There scattered by a *squirrel*,
Which out the kernel gotten had;
When quoth this fay, Dear queen, be glad,
Let Oberon be ne'er so mad,
I'll set you safe from peril. *Dayton.*

SQUIRREL, in zoology. See **SCIURUS**.
SQUIRT, *v. a., v. n. & n. s.* Of uncertain etymology. To throw out in a quick stream: let fly: an instrument for either purpose.

Water those with *squirts* of an infusion of the medicine in dunged water. *Bacon's Natural History.*

He with his *squirt*-fire could disperse
Whole troops. *Hudibras.*
You are so given to *squirting* up and down, and chattering, that the world would say I had chosen a jack-pudding for a prime minister. *L'Estrange.*
Sir Roger she mortally hated, and used to hire fellows to *squirt* kennel water upon him as he passed along. *Arbuthnot.*

The *squirters* were at it with their kennel water; for they were mad for the loss of their bubble. *Id.*

His weapons are, a pin to scratch, and a *squirt* to bespatter. *Pope.*

SRADHIA, a ceremony among the Hindoos in honor of departed ancestors. The 'Hindoo Pantheon' furnishes some particulars explanatory of this interesting and affecting ceremony, which, the author tells us, is an oblation of daily recurrence with Brahmans and rigid Hindoos who can afford it. It is offered not only in honor of deceased ancestors, but for their comfort; as the manes, as well as the gods connected with them, enjoy, like the gods of the Greeks, the incense of such offerings; which are farther of an expiatory

nature, similar, it may be presumed, in their efficacy, as well as in the motives that induce them, to the masses of the Romish church. Over these ceremonies of Sradha, Yama presides, in his character of Sradhadeva, or lord of the obsequies.

Mr. Colebrooke says (As. Res. vol. vii.) that the priests, in the performance of the Sradha, meditate the gayatri, and thrice repeat, 'Salutation to the gods, to the manes of ancestors, and to mighty saints; to Swaha (goddess of fire); to Swadha (the food of the manes); salutation to them for ever and ever.'

In the third chapter of the Institutes of Menu, the rules for the performance of the Sradha are detailed with prolixity. Among other particulars of the most important of those ceremonies, we learn that Brahmans only ought to be invited to the feast, which forms one important rite; and such Brahmans should be of holy and learned habits. A Sudra, that is, one of the fourth or servile class, is urgently prohibited as a guest. Let the housekeeper, it is said, who knows his duty, perform each day a Sradha with boiled rice, and the like, or with water, or with milk, roots, and fruit: for thus he obtains favor from departed progenitors, &c., &c., &c.

The following extract is from Colebrooke's Dissertation on the Religious Ceremonies of the Hindoos, in the seventh volume of the Asiatic Researches; which article contains much valuable matter, and many curious particulars of the Sradha, or feast attending funeral obsequies. "A dying man, when no hopes of his surviving remain, should be laid on a bed of Kusa grass (see KUSA), in the open air, his head sprinkled with water drawn from the Ganges, and smeared with clay brought from the same river. A salagrama stone (see SALAGRAMA) should be placed near him, holy strains from the Veda (see VEDA) should be chanted aloud, and leaves of holy basil scattered over his head. When he expires, the corpse must be washed, perfumed, and decked with wreaths of flowers, and carried by the nearest relations to some spot in the forest, or near water: the funeral pile is lighted from the consecrated fire maintained by the deceased. See of this under our articles SAGNIKA and SAMI. The nearest relation applies the flaming brand to the pile, hung round with flowers; and the attendant priests recite the appropriate invocations: 'Fire! thou wast lighted by him; may he, therefore, be reproduced from thee, that he may attain the regions of celestial bliss. May this offering be auspicious!' All who followed the corpse walk round the pile, but may not view the fire. They then proceed to the river, and, after bathing, present oblations of water to the manes of the deceased, saying, 'May this oblation reach thee!' Elegiac verses, such as the following, are then recited.

'Foolish is he who seeks for permanence in the human state; insolid, like the stem of the plantain-tree; transient, like the foam of the ocean.'

'When a body, formed of five elements, to receive the reward of deeds done in its own former person, reverts to its own five original principles, what room is there for regret?'

'The earth is perishable; the ocean, the gods themselves pass away: how should not that bubble, mortal man, meet destruction?'

'All that is low must finally perish; all that is elevated must ultimately fall; all compounded bodies must end in dissolution; and life be concluded by death.'

Exclusive of the daily sradhas, or feasts, given by wealthy individuals, formal obsequies are performed ninety-six hours in every year, on particular days. 'It should be observed,' Mr. Colebrooke says, 'respecting the practice of giving food at these obsequies, that Brahmans generally give it to one or more of their own relations. A stranger, unless indigent, would be very unwilling to accept the food, or attend at a sradha, for the purpose of eating it. The use of flesh meat is positively enjoined to Hindoos at certain obsequies, and recommended at all.' See Inst. of Menu, c. iii. v. 124, 268, &c. But the precepts of their lawgivers are, by some, deemed obsolete in the present age; and are evaded by others, who acknowledge the cogency of these laws. These commonly make a vow of abstaining from flesh meat, and consider that vow as more binding than the precepts here alluded to. Others, again, not only eat meat at obsequies and solemn sacrifices, but make it their common diet, in direct breach of their religion.' It hence appears clear that the idea so common in Europe, of the universal abstinence of Hindoos from flesh meat, is as erroneous as general. Some pages of the Hindoo Pantheon are devoted to prove this fact; and it is fully proved that not only all Hindoos may, but that a great majority of those who can obtain it, including Brahmans themselves, actually do eat meat. The feast attendant on the ceremonies of the Sradha can be given only by the son, the grandson, or male issue of the defunct; and as the greatest importance is attached by Brahmans and others to the due performance of these ceremonies, default of male issue is deprecated as among the heaviest of misfortunes. The Hindoo books, therefore, abound in instances of the efficacy of prayers, sacrifices, alms to Brahmans, pilgrimages, austerities, &c., in obtaining this grand object of comfort to departed souls. Appeasing the manes, by the Sradha, is as common in the mind of a Hindoo, as relieving the pains of purgatory by masses is in that of a Papist. Though the ceremonies differ, the principle is strikingly similar. Being childless is felt as an angry visitation of the gods inflicted partly for sins in a former state of existence: they are, therefore, propitiated by alms, pilgrimages, &c. One mode of removing sterility is by circumambulating an image, or tree, sacred to some deity. Of this see under PRADAKSHNA, the name of this ceremony. If every thing fail, there is, however, still a remedy by adoption, accompanied by certain ceremonies, expensive, according to the means of the party. Another is by giving daughters in marriage with like ceremonies; all of which are minutely detailed in the ritual. For all these proceedings divine authority can be quoted. Holy men, of even divinities, in the times of their terrestrial sojournments, are related to have done the like 'He,' says Menu, 'who has no son, may appoint

a daughter to raise up a son for him, saying, 'The male child who shall be born from her in wedlock shall be mine, for the purpose of performing my obsequies.' In this manner Daksha himself, lord of created beings, anciently appointed all his fifty daughters to raise up sons to him, for the sake of multiplying his race.'

SRADHADEVA, in Hindoo mythology, a name of the Pluto of their infernal regions. It means lord of the sradha, a feast often, by many daily, offered in commemoration of deceased ancestors. The more common name for the lord of the obsequies is **YAMA**, which see.

SRAVAKA, the name of the laity of the Jainas, a sect of schismatic Hindoos. Their priests are called Yati. A name also of the god Budha, or Boohd. See **Moor on Hindoo Infanticide**, p. 174. Among the Mahrattas, the sra-vakas are called shevari.

SRI, in the Hindoo mythology, is a name given to several goddesses; oftenest perhaps to **Lakshmi**, the goddess of prosperity and abundance. This name is in the first case Sris, which Sir William Jones remarked as resembling, both in name and character, the goddess of abundance of the Latins; and he says, that in very ancient temples near Gaya there are images of **Lakshmi**, with full breasts, and a cord twisted under her arm, like a horn of plenty, which looks very much like the old Grecian and Roman figures of **Ceres**. See **LAKSHMI**. The word **Sri**, however, although given as a name or epithet to the **Ceres** of India, and to the other great goddesses **Parvati** and **Saraswati**, is not confined to them: it means fortunate, happy, &c., as well as blessed or divine; and is sometimes prefixed to the names both of gods and men.

SRI BHAGAVATA, the title of a work in the Sanscrit language, of great celebrity among the Hindoos. It is usually ascribed to **Vyasa**, the reputed compiler or author of the **Vedas**, **Puranas**, **Mahabarat**, and other works. But the real author of the **Sri Bhagavata** is **Vopadeva**, who, in attempting to revive the leading doctrines of **Vyasa**, opened a door to the reconciliation of the various sects of Hindoos, numerous divided and subdivided as they are, and, as far as historical evidence can be traced, ever have been.

The main subject of the **Bhagavat** is the life and actions of **Krishna**; including the extravagant and mystical details of his incarnation, miracles, debaucheries, and various fooleries; intermixed, however, with sublime effusions of pure theology and morals. See **MYSTICAL POETRY**. Like most of the other respected writings of the Hindoos, it contains much to applaud and admire; but more, whether viewed philosophically or morally, to reprehend. It is comprised in twelve books, and, like the other poems bearing the common denomination of **Purana**, contains, besides the general thread of sectarian theology interwoven throughout, five subjects, viz. primary creation, or creation of matter in the abstract; secondary creation, or the production of subordinate beings, both spiritual and material; chronological account of their grand periods of time called **Manwantara**; genealogical rise of families, particularly of those who have reigned in India; and lastly a history of the lives of par-

ticular families. This work is in general estimation, and is found in most of the vulgar dialects of India, and in the Persian language. It has also appeared in a very imperfect and abridged form, in French, under the title of **Bagavadam**, translated from the **Tamul** version. Its title is derivable from **Bhagavan**, one of the names of **Krishna** and **Vishnu**; and **Bhagavan** from **Bhaga**, meaning, it is said, the author of existence, or lord of nature. See **SIVA**. **Sri** is a prefixure of respect, extensively applied. See **SRI**. The modern sect, who adhere to the liberal doctrine expounded in this work, are called **Bhagavatas**.

But we must again refer to our article **SECTS OF HINDOOS**, for an explanation of the nature of the Hindoo sectarial distinctions. See also **KRISHNA**, for an account of the hero of the **Bhagavat**.

SRIPADA (Hind. a *divine footstep*). On the top of the mountain, in the island of Ceylon, which European geographers call **Adam's Peak**, the Hindoos fancy there is a sripad; and accordingly pilgrimages are made to it from distant parts of India. **Vishnu**, it is said, alighted on this spot, and left the holy and indelible impression. In the neighbourhood of temples, or at their threshold, it is not unusual to see a flat stone embossed or engraved with the impression of two feet, joined from heel to toe; such being the attitude of adoration; and it is said that such stones are the last terrene substance pressed by the feet of the unhappy victims of superstition, who burn themselves alive on the pile of their husbands. They step from these flat stones upon the pile, and then appertain more to the next world than to this. The next step is into the presence of the gods; or, in the case of temples, to their holy place. The Hindoos are not the only people who have a veneration for the mystical impressions of feet. The sripad above mentioned on Ceylon was said by our early zealous missionaries to have been left by **Adam**; they endeavouring to establish the fact of that chosen island having been the **Eden** of our first parents. In the holy land miraculous sripada, or footsteps, are still shown and revered, as left by the last pressure of our Saviour on the earth. On this subject the reader will find some interesting remarks in **Dr. Clarke's Travels**, vol. ii. p. 584.

STAAL (Madam de), a celebrated French lady of the eighteenth century, who wrote her own **Memoirs**, but without mentioning the year of her birth. She was the daughter of **M. De Launai**, a painter, and was educated in a convent, by the favor of the abbess; but, her patroness dying, she became waiting maid to the duchess of **Maine**. A letter which she wrote to the celebrated **Fontenelle** raised her literary fame, and attracted the attention of the wits of **Paris**. She married lieutenant **De Staal** of the **Swiss guards**, afterwards **Mareschal**. She died in 1750; and her **Memoirs**, in 4 vols. 12mo., with two of her comedies, were published soon after.

STAB, *v. a., v. n., & n. s.* Teut. *stab*, a stick; old Dutch *staven*. To pierce with a pointed weapon; wound mortally or mischievously: to give a wound with a pointed weapon; offer to wound: the wound given; a stroke; blow

Hear the lamentations of poor **Anne**,
Wife to thy **Edward**, to thy slaughtered son;

Stabbed by the self-same hand that made these wounds. *Shakspeare.*

Thou hid'st a thousand daggers in thy thoughts,
Which thou hast whetted on thy stony heart,
To stab at my frail life. *Id. Henry IV.*

He speaks poinards, and every word stabs. *Shakspeare.*

None shall dare
With shortened sword to stab in closer war,
But in fair combat fight. *Dryden's Knight's Tale.*

Killing a man with a sword or a hatchet are looked on as no distinct species of action; but, if the point of the sword first enter the body, it passes for a distinct species where it has a distinct name; as in England, where it is called *stabbing*. *Locke.*

He had a scripture ready to repel them all; every pertinent text urged home being a direct stab to a temptation. *South.*

Cleander,
Unworthy was thy fate thou first of warriors,
To fall beneath a base assassin's stab. *Rowe.*

Porcius, think thou seest thy dying brother
Stabbed at his heart, and all besmeared with blood,
Storming at thee! *Addison's Cato.*

What tears will then be shed!
Then, to complete her woes, will I espouse
Hermione: 'twill stab her to the heart! *A. Philips.*

STABBING, in law. The offence of mortally stabbing another, though done upon sudden provocation, is punished as murder; the benefit of clergy being taken away from it by statute. For, by James I. c. 8, when one thrusts or stabs another, not then having a weapon drawn, or who hath not then first stricken the party stabbing, so that he dies thereof within six months after, the offender shall not have the benefit of clergy, though he did it not of malice aforethought. This statute was made on account of the frequent quarrels and stabbings with short daggers between the Scotch and the English, at the accession of James I.; and, being therefore of a temporary nature, ought to have expired with the mischief which it meant to remedy. For, in point of solid and substantial justice, it cannot be said that the mode of killing, whether by stabbing, strangling, or shooting, can either extenuate or enhance the guilt; unless where, as in the case of poisoning, it carries with it internal evidence of cool and deliberate malice. But the benignity of the law hath construed the statute so favorably in behalf of the subject, and so strictly when against him, that the offence of stabbing now stands almost upon the same footing as it did at the common law. Thus (not to repeat the cases mentioned under **MANSLAUGHTER**, of stabbing an adulteress, &c., which are barely manslaughter, as at common law), in the construction of this statute it hath been doubted, whether, if the deceased had struck at all before the mortal blow given, this does not take it out of the statute, though in the preceding quarrel the stabber had given the first blow; and it seems to be the better opinion that this is not within the statute. Also it hath been resolved that the killing a man, by throwing a hammer or other weapon, is not within the statute; and whether a shot with a pistol be so or not is doubted. But if the party slain had a cudgel in his hand, or had thrown a pot or a bottle, or discharged a pistol at the party stabbing, this is a

sufficient reason for having a weapon drawn on his side within the words of the statute.

STABEN (Henry), an eminent painter, born in Flanders in 1578. He was a disciple of Tintoretto, was capital in history and perspective, and died in 1658.

STABILIMENT, or } Lat. *stabilis*. Sup-
STABILITY, *n. s.* } port; firmness; act of
STABLE, *adj.* } making firm; fixed-
STABLENESS, *n. s.* } ness: stability is the
more usual word: stable is fixed, steady, constant: stability is the power to stand; steadiness.

The king becoming graces,
As justice, verity, temperance, *stablenss*,
Bounty, persever'ance, I have no relish of them. *Shakspeare.*

If man would be invariable,
He must be like a rock, or stone, or tree;
For even the perfect angels were not *stable*,
But had a fall more desperate than we. *Davies.*

He began to try
This and that hanging stone's *stability*. *Cotton.*

Since fluidness and *stability* are contrary qualities, we may conceive that the firmness or *stability* of a body consists in this, that the particles which compose it do so rest, or are intangled, that there is among them a mutual cohesion. *Boyle.*

By the same degrees that either of these happen, the *stability* of the figure is by the same lessened. *Temple.*

He perfect, *stable*; but imperfect we,
Subject to change. *Dryden's Knight's Tale.*

This region of chance and vanity, where nothing is *stable*, nothing equal; nothing could be offered to-day but what to-morrow might deprive us of *Rogers*.

These mighty girders which the fabric bind,
These ribs robust and vast in order joined,
Such strength and such *stability* impart,
That storms above, and earthquakes under ground,
Break not the pillars. *Blackmore.*

They serve for *stabiliment*, propagation, and shade. *Derham.*

STABLE, *n. s., v. n., & v. a.* } Lat. *stabulum*. A
STABLEBOY, *n. s.* } house for beasts.
STABLEMAN. } to kennel; dwell
as beasts: the compounds corresponding.

I will make Rabbah a *stable* for camels. *Ezra*
I would with jockeys from Newmarket dine,
And to rough riders give my choicest wine;
I would caress some *stableman* of note,
And imitate his language and his coat. *Bramstone.*

In their palaces,
Where luxury late reigned, sea-monsters whelped
And *stabled*. *Milton.*

Stolth disorder filled his *stable*,
And sluttish plenty decked her table. *Prior.*

As soon as you alight at the inn deliver your horses to the *stableboy*. *Swift.*

If the gentleman hath lain a night get the *stableman* and the scullion to stand in his way.

Id. Directions to the Butler.

STABLE, in rural economy, a building or house constructed for horses and other animals, being furnished with stalls and proper contrivances to contain their food and other matter. See **RURAL ARCHITECTURE**.

STABLESTAND, *n. s.* In law. One of the four evidences or presumptions, whereby a man is convinced to intend the stealing of the king's deer in the forest: 'and this is when a man is found at his standing in the forest, with a cross-bow bent, ready to shoot at any deer; or with a

long bow; or eise standing close by a tree with greyhounds in a leash ready to slip.—Cowell.

I'll keep my *stablestand* where I lodge my wife;
I'll go in couples with her. *Shakspeare.*

STABLISH, *v. a.* Lat. *stabilio*; Fr. *establi*. To establish; fix; settle.

Comfort your hearts, and *stabliss* you in every good work. *2 Thess. ii. 17.*

Then she began a treaty to procure,
And *stabliss* terms betwixt both their requests. *Spenser.*

Stop effusion of our Christian blood,
And *stabliss* quietness on every side. *Shakspeare. Henry VI.*

Poor hereticks in love there be,
Which think to *stabliss* dangerous constancy;
But I have told them, since you will be true,
You shall be true to them who're false to you. *Donne.*

His covenant sworn
To David, *stabliss* as the days of heaven. *Milton.*

STABLO. See **STAVELO**.

STACHYS, in botany, a genus of plants belonging to the class of didynamia, and order of gymnospermia; natural order forty-second, verticillatæ. The upper lip of the corolla is arched; the lower lip is reflexed, and the larger intermediate lacina is marginated. The stamina, after shedding the farina, are bent towards the sides. There are sixteen species, viz. 1. *S. æthiops*; 2. *alpina*; 3. *annua*; 4. *arvensis*; 5. *Canariensis*; 6. *cretica*; 7. *Germanica*; 8. *glutinosa*; 9. *hirta*; 10. *lanata*; 11. *maritima*; 12. *orientalis*; 13. *Palæstina*; 14. *palustris*; 15. *recta*; and, 16. *sylvatica*. Of these only four are natives of Britain; viz. 1. *S. arvensis*, corn stachys, petty ironwort, or all-heal. The stalk is ten or twelve inches high, square, branched, and hairy. The leaves are heart-shaped, obtuse, bluntly serrated, and less hairy. The calyx is hairy and sessile, and deeply divided into five acute dents of equal length. The flowers are flesh-colored, and grow from three to six in a whirl. The lower lip is trifid; the middle segment spotted with red, but not emarginated according to the character of the genus. It is frequent in corn-fields, and grows from June to August. 2. *S. Germanica*, base horehound. The stem is downy, and about two feet high. The leaves are white, downy, wrinkled, and indented. The flowers are white, purplish within, and grow in multiflorous whirls. It grows in England. 3. *S. palustris*, clown's all-heal. The roots are white and tuberous. The stalk is branched at the bottom, and two or three feet high. The flowers are red or purple, from six to ten in a whirl, ending in a long spike. The leaves are sessile, narrow, pointed, and in part surrounding the stem. This plant has a fetid smell and bitter taste, and is reckoned a good vulnerary. It grows on the sides of rivers and lakes, in low moist grounds, and sometimes in corn-fields. 4. *S. sylvatica*, hedge nettle. The plant is hairy all over, erect, a yard high, and branched; the hairs are jointed. The flowers are of a deep red color, six or eight in a whirl, which terminates in a long spike destitute of leaves. The leaves are heart-shaped, and grow on foot-stalks. The whole plant has a strong

fetid smell. It grows commonly in woods and shady places, and flowers in July or August.

STACK, *n. s. & v. a.* Ital. *stacca*; Goth. and Swed. *stack*. A large quantity of hay, corn, or wood, heaped up; a number of chimneys built together: to pile up.

So likewise a hovel will serve for a room,
To *stack* on the pease. *Tusser.*

Against every pillar was a *stack* of billets above a man's height, which the watermen that bring wood down the Seine laid there. *Bacon's Natural History.*

While the marquis and his servant on foot were chasing the kid about the *stack*, the prince from horseback killed him with a pistol. *Wotton's Buckingham.*

While the cock
To the *stack* or the barn-door
Stoutly struts his dame before. *Milton.*

The prices of *stacking* up of wood I shall give you. *Mortimer.*

Stacks of moist corn grow hot by fermentation. *Newton.*

A mason making a *stack* of chimneys the foundation of the house sunk. *Wiseman's Surgery.*

An inundation, says the fable,
O'erflowed a farmer's barn and stable;
Whole ricks of hay and *stacks* of corn
Were down the sudden current borne. *Swift.*

STACKHOUSE (Thomas), a learned and pious English divine, who was many years curate of Finchley, and afterwards vicar of Beenham, in Berkshire. He first attracted the public attention by his treatise On the Miseries of the Inferior Clergy, 1722. He acquired still greater fame by his New History of the Bible, in 2 vols. folio; which has been often reprinted, in 6 or 8 vols. 8vo. He also wrote several other works; and died in 1752.

STADIUM, an ancient Greek long measure containing 125 geometrical paces, or 625 Roman feet, corresponding to our furlong. The word is said to be formed from the Greek word *στασις*, a station, or *στημι*, to stand, because it is reported that Hercules, having run a stadium at one breath, stood still at the end of it. The Greeks usually measured distances by stadia, which they called *παραδασμος*. Stadium also signified the course on which their races were run.

STADIUS (John), a learned mathematician, born at Loenhout, near Antwerp, in 1527. He became professor of history at Louvain, and afterwards of mathematics and history at Paris; where he died in 1579. He published, 1. *Ephemerides*: Cologne, 1556 and 1570. 2. *Tabula Æquabilis et apparentis motus cælestium corporum*: 3. *Commentarius in Lucium Florum*.

STAD'LE, *n. s. & v. a.* Sax. *stadel*, a foundation. Any thing which serves for support; staff; crutch: to furnish with stables. Obsolete.

Leave growing for *staddles* the likeliest and best,
Though seller and buyer dispatched the rest. *Tusser.*

First see it well fenced, ere hewers begin;
Then see it well *staddled* without and within. *Id.*

He cometh on, his weak steps governing
And aged limbs on cypress *stadle* stout,
And with an ivy twine his waist is girt about. *Spenser.*

Coppice-woods, if you leave in them *staddles* too thick, will run to bushes and briars, and have little clean underwood. *Bacon.*

STADTHOLDER. This office was abolished by the French and Dutch republicans, in 1795. For

its institution, in favor of William I., see UNITED PROVINCES.

STADTHOLDERATE, the office and dignity of stadtholder.

STÆHELINA, in botany, a genus of plants belonging to the class of syngenesia, and order of polygamia æqualis; natural order forty-ninth, compositæ. The receptacle is paleaceous, the chaff being very short; the pappus is branched, and the antheræ caudated. There are eight species; viz. 1. *S. arborescens*; 2. *chamæpeuce*; 3. *corymbosa*; 4. *dubia*; 5. *fruticosa*; 6. *gnaphaloides*; 7. *ilicifolia*; and, 8. *imbricata*.

STAEL HOLSTEIN (Anne Louise Germaine Necker, baroness de), a late celebrated female writer, was the daughter of M. Necker, the French financier, and born at Paris, April 22d, 1766. She soon displayed signs of genius; and at the age of fifteen was capable of discussing with her father the most serious and important subjects. Theatrical compositions at this time also particularly interested her; and before she was twenty she wrote a comedy in three acts, entitled *Sophie, ou les Sentiments secrets*; and the year following she produced a tragedy on the story of Lady Jane Gray. In 1786 she was married to the baron de Stael Holstein, the Swedish ambassador, through the patronage of the queen of France; and was consequently introduced at court. Her *Lettres sur J. J. Rousseau*, soon after published, attracted great notice. In August, 1788, she had the pleasure of announcing to her father his appointment to the ministry; but this triumph was not of long duration, for M. Necker was dismissed from office, and he left France accompanied by his daughter. He had scarcely reached Basil, when he was recalled, only, however, to experience the inconstancy of popular favor, as he was soon obliged again to resign. Mad. de Stael followed him in his retreat to Coppet; but she revisited France in 1792, when she endeavoured to save some of the victims of revolutionary fury. Her own life was endangered, however, and she only escaped through the care of Manuel, attorney of the commune of Paris. She returned to Switzerland, and subsequently went to England, where she heard of the execution of Louis XVI. She immediately rejoined her father, and published an elegant *Défense de la Reine*. After the fall of Robespierre she produced two anonymous pamphlets, *Réflexions sur la Paix, adressées à M. Pitt et aux Français*; and *Réflexions sur la Paix Intérieure*. Under the Directory she again returned to France, where she, through her influence with Barras, was the means of procuring the elevation of Talleyrand to the post of minister of foreign affairs. In December, 1797, she for the first time saw Buonaparte at Paris, preparing for his expedition to Egypt; and the admiration with which she had regarded the conqueror of Italy was succeeded by a sentiment bordering on aversion, which seems to have become mutual. She continued in France after the return of Buonaparte, and her influence was frequently employed in opposition to his views. She at length left France, and went to reside with her father. She remained about twelve months at this time in her retreat, and

composed the romance of *Delphine*, which was not published till 1803. She returned to Paris; but this work, and a tract entitled *Les Dernières Vues de Politique et de Finance*, published by M. Necker, had given so much offence that Napoleon, at the close of the year 1803, banished madame de Stael. She was consequently obliged to leave her father, whom she never afterwards saw. After visiting Germany and Italy, she was permitted to return to Coppet in 1805; and subsequently resided at Auxerre and at Rouen. In 1807 appeared her *Corinne*, a novel, the sentiments of which revived the anger of the French ruler, and she was again exiled to Coppet. In this retirement she was visited by a young French officer, M. de Rocca, whom she afterwards married, and by whom she had a son; but the union was kept a secret till after her death. In 1812 she took a journey into Austria; thence she went to Russia, and afterwards visited Sweden and England. She was in London at the period of the taking of Paris; and, on the restoration of Louis XVIII., she returned to France. On the escape of Buonaparte from Elba, she retired to Coppet; and after the battle of Waterloo, and the decree of the 5th of September, 1815, made her appearance at Paris, with her daughter, then married to the duke de Broglie. She was favorably received by Louis XVIII.; and obtained an order on the royal treasury for the payment of £2,000,000, which had been deposited there by M. Necker. In 1816 she went to Italy, and resided at Pisa. Returning to France, her death took place July 14th, 1817. Her works, beside those already mentioned, are, *Considérations sur les principaux Evénemens de la Révolution Française*; *De la Littérature considérée dans ses Rapports avec les Institutions Sociales*; and, *L'Allemagne, or Observations on Germany, &c.*, have been published since her death.

STAFF, *n. s.* } Plur. staves. Sax. *stæf*
STAFFISH, *adj.* } Dan. *staff*; Belg. *staf*; Goth. *stafa*, is to command. A stick with which a man supports himself in walking; a club; an ensign of office: staffish is stiff; harsh.

A wit in youth not over dull, heavy, knotty, and lumpish, but hard, tough, and though somewhat staffish, both for learning and whole course of living, proveth always best. *Ascham.*

It much would please him,
 That of his fortunes you would make a staff
 To lean upon. *Shakspeare. Antony and Cleopatra.*

The boy was the very staff of my age, my very prop
Shakspeare.

I cannot strike at wretched kernes, whose arms
 Are hired to bear their staves. *Id. Macbeth.*

Methought this staff, mine office badge in court,
 Was broke in twain. *Id. Henry VI.*

All his officers brake their staves; but at their return new staves were delivered unto them.

Hayward on Edward VI.
 Grant me and my people the benefit of thy chastisements, that thy rod as well as thy staff may comfort us. *King Charles.*

If a subject be a son, then ought he to be a staff
 unto his father, wherewith not to strike, but to sustain him. *Holiday.*

He forthwith from the glittering staff unfurled
 The imperial ensign.

Descending and ascending by ladders, I ascended at one of six hundred and thirty-nine *staves*, or eighty-nine fathoms.

Browne's Travels.

With forks and *staves* the felon they pursue.

Dryden.

He that bought the skin ran greater risque than t'other that sold it, and had the worse end of the *staff*.

L'Strange.

To his single eye that in his forehead glared,
Like a full moon or a broad burnished shield,
A forky *staff* we dexterously applied,
Which, in the spacious socket turning round,
Scoopt out the big round gelly from its orb.

Addison.

Is it probable that he, who had met whole armies in battle, should now throw away his *staff* out of fear of a dog?

Broome.

The author of *Davideis* is commended by *Dryden* for having written it in couplets, because he discovered that any *staff* was too lyrical for an heroic poem.

Johnson.

STAFF, n. s. *Isl. stef.* A stanza; a series of verses regularly disposed, so as that, when the series is concluded, the same order begins again. See **STAVE**.

Cowley found out that no kind of *staff* is proper for an heroic poem, as being all too lyrical; yet though he wrote in couplets, where rhyme is freer from constraint, he affects half verses.

Dryden.

When *Crito* once a panegyric showed,
He beat him with a *staff* of his own ode.

Harte.

STAFF, in music, five lines, on which, with the intermediate spaces, the notes of a song or piece of music are marked.

STAFF, in naval affairs, is a light pole erected in different parts of a ship, whereon to hoist and display the colors. The principal of these is reared immediately over the stern, to display the ensign; another is fixed on the bowsprit, to extend the jack; three more are erected at the three mast heads, or formed by their upper ends, to show the flag or pendant of the respective squadron or division to which the ship is appropriated. See **ENSIGN**, **JACK**, **MAST**, and **PENDANT**.

STAFF, in military matters, consists of a quarter-master-general, adjutant-general, and majors of brigade. The staff properly exists only in time of war. See **QUARTER-MASTER GENERAL**, &c.

STAFF, **REGIMENTAL**, consists of the adjutant, quarter-master, chaplain, surgeon, &c.

STAFFA, one of the Western Islands of Scotland, remarkable for its basaltic pillars. It was visited by *Sir Joseph Banks*, who communicated the following account of it to *Mr. Pennant*. Staffa lies fifteen miles west of Mull, and nine north-east of Icolumbkill; 'Its greatest length is about an English mile, and its breadth about half a one. On the west side of the island is a small bay, where boats generally land; a little to the south of which the first appearance of pillars is to be observed: they are small; and, instead of being placed upright, lie down on their sides, each forming a segment of a circle. Thence you pass a small cave, above which the pillars, now larger, incline in all directions; in one place, in particular, a small mass of them very much resembles the ribs of a ship. Hence having passed the cave, which, if it is not low-

water you must do in a boat, you come to the first ranges of pillars, which are still not above half as large as those a little beyond. Over against this place is a small island, called in *Erse* *Boo-sha-la*, separated from the main by a channel not many fathoms wide. This whole island is composed of pillars, without any stratum above them; they are still small, but by much the neatest formed of any about the place. The first division of the island (for at high water, it is divided into two) makes a kind of cone, the pillars converging together towards the centre; on the other they are in general laid down flat: and in the front next to the main you see how beautifully they are packed together, their ends coming out square with the bank which they form. All these have their transverse sections exact, and their surface smooth; which is by no means the case with the large ones, which are cracked in all directions. I much question, however, if any part of this whole island of *Boo-sha-la* is two feet in diameter. The main island opposite to *Boo-sha-la*, and farther towards the north-west, is supported by ranges of pillars pretty erect, and, though not tall (as they are not uncovered to the base), of large diameters; and at their feet is an irregular pavement, made by the upper sides of such as have been broken off, which extends as far under water as the eye can reach. Here the forms of the pillars are apparent: these are of three, four, five, six, and seven sides; but the number of five and six are by much the most prevalent. The largest I measured was of seven: it was four feet five inches in diameter. The surfaces of these large pillars, in general, are rough and uneven, full of cracks in all directions; the transverse figures in the upright ones never fail to run in their true directions. The surfaces upon which we walked were often flat, having neither concavity nor convexity; the larger number, however, were concave, though some were very evidently convex. In some places, the interstices within the perpendicular figures were filled up with a yellow spar; in one place a vein passed in among the mass of pillars, carrying here and there small threads of spar. Though they were broken and cracked through, in all directions, yet their perpendicular figures might easily be traced; whence it is easy to infer that, whatever the accident might have been that caused the dislocation, it happened after the formation of the pillars.—Hence, proceeding along shore, you arrive at *Fingal's* cave. Its dimensions I have given in the form of a table:—

	Feet. In.
Length of the cave from the rock without	371 6
From the pitch of the arch	250 0
Breadth of ditto at the mouth	53 7
At the farther end	20 0
Height of the arch at the mouth	117 6
At the end	70 0
Height of an outside pillar	39 6
Of one at the north-west corner	54 0
Depth of water at the mouth	13 0
At the bottom	9 0

The cave runs into the rock at the direction of north-east by east, by the compass. Proceeding

farther to the north-west, you meet with the highest ranges of pillars; the magnificent appearance of which is past all description. Here they are bare to their very basis, and the stratum below them is also visible: in a short time, it rises many feet above the water, and gives an opportunity of examining its quality. Its surface is rough, and has often large lumps of stone sticking in it as if half immersed; itself, when broken, is composed of a thousand heterogeneous parts, which together have very much the appearance of a lava; and the more so, as many of the lumps appear to be of the very same stone of which the pillars are formed. This whole stratum lies in an inclined position, dipping gradually towards the south-east. As hereabouts is the situation of the highest pillars, I shall mention my measurements of them, and the different strata in this place, premising that the measurements were made with a line, held in the hand of a person who stood at the top of the cliff, and reaching to the bottom; to the lower end of which was tied a white mark, which was observed by one who staid below for the purpose: when this mark was set off from the water, the person below noted it down, and made a signal to him above, who made then a mark in his rope: whenever this mark passed a notable place, the same signal was made, and the name of the place noted down as before: the line being all hauled up, and the distances between the marks measured and noted down, gave, when compared with the book kept below, the distances; as, for instance, in the cave, No. 1 in the book below, was called from the water to the foot of the first pillar in the book above; No. 1 gave thirty-six feet eight inches, the highest of that ascent which was composed of broken pillars.

Feet. In.

No. 1. Pillar at the west corner of Fingal's cave.

1 From the water to the foot of the pillar	12 10
2 Height of the pillar	37 3
3 Stratum above the pillar	66 9

No. 2. Fingal's cave.

1 From the water to the foot of the pillar	36 8
2 Height of the pillar	39 6
3 From the top of the pillar to the top of the arch	31 4
4 Thickness of the stratum above	34 4
By adding together the three first measurements, we got the height of the arch from the water	117 6

No. 3. Corner pillar west of Fingal's cave.

Stratum below the pillar of lava-like matter	11 0
Length of the pillar	54 0
Stratum above the pillar	61 6

No. 4. Another pillar to the west.

Stratum below the pillar	17 1
Height of the pillar	50 0
Stratum above	51 1

No. 5. Another pillar farther to the west.

Stratum below the pillar	19 8
Height of the pillar	55 1
Stratum above	54 7

The stratum above the pillars, which is here mentioned, is uniformly the same, consisting of numberless small pillars, bending and inclining

in all directions, sometimes so irregularly that the stones can only be said to have an inclination to assume a columnar form; in others more regular, but never breaking into or disturbing the stratum of large pillars, whose tops everywhere keep a uniform and regular line. Proceeding now along the shore, round the north end of the island, you arrive at Oua na scarve, or the Corvorant's cave. Here the stratum under the pillars is lifted up very high; the pillars above it are considerably less than those at the north-west end of the island, but still very considerable. Beyond is a bay, which cuts deep into the island, rendering it in that place not more than a quarter of a mile over. On the sides of this bay, especially beyond a little valley, which almost cuts the island into two, are two stages of pillars, but small; however, having a stratum between them exactly the same as that above them, formed of innumerable little pillars, shaken out of their places, and leaning in all directions. Having passed this bay, the pillars totally cease; the rock is of a dark brown stone, and no signs of regularity occur till you have passed round the south-east end of the island (a space almost as large as that occupied by the pillars), which you meet again on the west side, beginning to form themselves irregularly, as if the stratum had an inclination to that form, and soon arrive at the bending pillars where I began. The stone of which the pillars are formed is a coarse kind of basalt, very much resembling the Giant's Causeway in Ireland, though none of them are near so neat as the specimens of the latter which I have seen at the British Museum; owing chiefly to the color, which in ours is a dirty brown, in the Irish a fine black; indeed the whole production seems very much to resemble the Giant's Causeway.

STAFFORD, the county town of Staffordshire, in the Pirehill hundred of the county, twelve miles north-west from Litchfield, and 135 from London. It is a borough, consisting of two parishes united, situated on the banks of the Sow; the houses are well built, and covered with slate, and the streets are well paved. Formerly it was surrounded by a strong wall, and had four gates. The church of St. Mary has an octagonal tower, and a very antique font. St. Chad's is an old decayed building. Here are several dissenting chapels: the town-hall is a neat new building. Stafford has also a good hospital, free-school, twelve alms-houses, and a spacious market-place, with two banks. In the suburbs, and on the green, were formerly several free-chapels and hospitals. It was an exempt jurisdiction, under a dean and thirteen prebendaries, but the dean's house is now converted into a school. The assizes for the county are held here in the county-hall, a large handsome building; and near the town is the new infirmary, nearly opposite to which is the county-gaol. A lunatic asylum has lately been erected near. This is a very ancient borough, being first incorporated by king John; it sends two members to parliament. It is governed by a mayor, recorder, ten aldermen, ten common-councilmen, &c. The town has a considerable traffic, by

means of its canal, communicating with all the neighbouring counties. Its chief manufactures are cloth and shoes. Market on Saturday. Fairs, February 10, May 14, June 27, September 16, October 2, and December 4.

STAFFORDSHIRE. Stafford, the county town, gives name to this shire. This county belonged to the ancient *Connavii*, the division of *Flavia Cæsariensis* of the Romans, and the kingdom of Mercia during the Saxon Hierarchy. Bede calls the inhabitants *Angli Mediterranei*, the Midland English. Some have derived the name of Stafford from the river Sow, which skirts the western and southern sides of that town. It is probable that the Sow had at one time the letter *t* in its orthography; and if so there will be very little difficulty in discovering a rational etymology for Stafford and Staffordshire. In support of this opinion it is certain that the passage through the fords of the river into Stafford is in the recollection of many of the inhabitants of that borough.

Staffordshire is an inland county, lying nearly in the centre of the kingdom. It is a long and narrow tract, something in the form of a rhombus; bounded on the north by Cheshire and Derbyshire, on the east by Leicestershire, on the west by Shropshire, and on the south by Warwickshire and Worcestershire. Its greatest length from N. N. E. to S. S. W. is about sixty miles; and its greatest breadth, from Newton Salney to the western point of Terbey Heath, near Market Drayton in Shropshire, is thirty-eight miles. It contains about 780,800 acres of land. It is divided into five hundreds, one city, six boroughs, and sixteen market-towns. There are 181 parishes, reckoning, according to Mr. Pitt's Agricultural Survey, every tract of land to be a parish which has a place of worship, and united in some degree by a common or mutual interest. It is in the diocese of Litchfield and Coventry, except two parishes. It is included in the Oxford circuit.

The *climate* of this county is rather inclining to wet. The air is generally good; but in the northern parts extremely sharp, impressing the nerves with a greater degree of cold than in most other counties of England. The annual rains are calculated, supposing them to stagnate without waste or evaporation, at upwards of thirty-six inches, an excess of nearly sixteen inches above the computed rains in the metropolis. The quantity of snow which falls in the Moorlands during winter is very great; a circumstance which no doubt contributes much to the piercing coldness of this district.

This county exhibits as great a variety of *soils* as any other in England of proportionate extent. Mr. Pitt says the arable soils may in general be divided into, first, the stiff and strong clayey (argillaceous); secondly, the loose and light (arenaceous); thirdly, although the county have no chalk, yet, in the limestone district, lime earth (calcareous); fourthly, the mixed or compound soil or loam composed of the above, with the addition of stones and other matters (*terra composita*). The argillaceous soil is most prevalent in the hundred of Cuttlestone, and in those portions of the hundred of Offlow to the

south of the Trent and east of the Tame, together with the southern parishes in the hundreds of Pyrehill and Totmanslow. The arenaceous soil predominates chiefly in the hundred of Offlow to the south of the Trent, and in the lands adjoining to Pattingham Womfum, Himley, and King's Swinford in the hundred of Leisdon. The calcareous district is of small extent, and situated chiefly eastward of a semicircular line which may be supposed to be drawn from Farley by Kingsale and Ipstones to Warton, in the hundred of Totmanslow. The other districts of that hundred, and all the central portions of the county, or on the south side of the river Trent, are composed of the mixed compound soil. The meadow grounds, which for the most part lie in the vicinity of the canals and rivers, usually partake of the arable soils in their neighbourhood, with the addition of the sediment of water, when within reach of the streams. In some particular spots peat earth forms the soil in the meadow ground reaching different degrees of thickness in different places. This species of earth consists principally of the decayed roots of aquatic vegetables. Sometimes it contains trunks of trees, of which many curious specimens have been found near Stonehall in the parish of Shenstone. When properly drained, consolidated, and meliorated, this kind of soil becomes valuable pasture and meadow land.

Staffordshire is plentifully watered by rivers, but none of them are navigable within its boundaries. The principal are the Trent, the Dove, the Tame, and the Sow. The first is esteemed the third river in England. Its proper rise is in the hills beyond Newcastle-under-Line, at Newport near Biddulph. During its passage through Staffordshire its banks are covered with rich and luxuriant meadows, between which the water glides along in silver beauty. As it approaches Derbyshire it forms a number of small islands; and, upon reaching the confines of that county, sweeps rapidly to the north, and becomes the boundary between it and Staffordshire till its junction with the river Dove. This latter river takes its rise among the hills in the Moorlands, near the points where the three counties of Stafford, Derby, and Chester meet. Having been increased by the union of the Manifold near Thorp Cloud Hill, the Hamps at Ham, and the Charnet near Leek, it finally falls into the Trent not far from Tutbury. The Tame springs from several sources in the vicinity of Walsall and Coleshill, and forms a junction with the Trent at the point where that river reaches the borders of Derbyshire. The Blythe, which falls into the Trent near King's Bromley, may also be reckoned among the considerable rivers of this county. It rises in the neighbourhood of Wetley Moor in the northern district. Its line of direction is nearly parallel to the Trent. The Sow from Eccleshall, and the Penk from the vicinity of Somerford near Penkridge, forming a junction below Stafford, proceed together to Great Haywood, where they likewise precipitate themselves into the Trent. The Stour and the Dove also in part belong to this county. Though the rivers in this county are not navigable, the deficiency is amply compensated by the many

conveniences which it enjoys arising from canals. The Grand Trunk Canal unites the three ports of Bristol, Liverpool, and Hull. It enters this county near Lawton. It has numerous branches in almost every convenient direction, and in its passage through Staffordshire generally follows a course parallel to the Trent, which it intersects at different points, and falls into it at Wilden in Derbyshire. The Staffordshire and Worcestershire canal, the Willey and Essington canal, the Birmingham canal, and Sir Nigel Gresley's canal, all contribute to the facilities of trade, &c., in this county. There are not many lakes or springs in Staffordshire. The principal one is that of Aquelate, which measures 1848 yards in length, and 672 yards in breadth. Ladford Pool has been drained for some years. Salt springs, however, are found in various parts; the most important of which are at Shirlywich, in the parish of Weston. Here also are a few sulphureous springs. The other productions of this county are chiefly of a mineral kind, and these both numerous and valuable. Upwards of 50,000 acres have been ascertained to contain an almost inexhaustible store of coal, near enough the surface of the ground to be easily raised. Limestone is still more abundant than coal. Iron ore is also plentiful. Very excellent freestone is found in several quarries. Alabaster, marble, and above all potter's clay, are dug here. The agricultural products have nothing very remarkable in them.

This county sends seventeen members to Parliament; viz., four for the shire, two for the city of Lichfield, two for Stafford, two for Newcastle-under-line, and two for Tamworth. The additions by the Reform Bill are, two for Wolverhampton, two for Stoke-upon-Trent, and one for Walsall.

Staffordshire is not very copious in its biography; but among the natives of eminence from thence we find some of distinguished character and celebrity. We may notice the following:—Thomas Allen, a mathematician. Born at Uttoxeter in 1542. Died 1632. Alexander Gardner, a distinguished naval commander. Born at Uttoxeter, 1742. Died 1810.—Lord George Anson, the circumnavigator. Born at Hugborough, 1697. Died 1762.—Elias Ashmole, philosopher and antiquary. Born at Litchfield, 1617. Died 1692.—Thomas Astle, the antiquary. Born at Yoxall, 1735. Died 1803.—Lord James Audley, a distinguished warrior. Born at Heleigh, 1314. Died 1386.—Simeon Ashmole, a Non-conformist divine. Died 1662.—Isaac Hawkins Browne, poet. Born at Burton-upon-Trent, 1705. Died 1760.—Charles Cotton, the poet. Born at Beresford. Died about 1687.—Dr. Richard Hurd, bishop of Worcester. Born at Cotgreve. Died 1808, in the eighty-ninth year of his age.—Elijah Fenton, the poet. Born at Shelton. Died 1730.—Dr. R. James, inventor of the fever powders bearing his name. Born at Kinverston, 1703. Died 1716.—Dr. Samuel Johnson, the great lexicographer. Born at Litchfield in 1709. Died 1784.—Dr. J. Lightfoot. Born at Stafford, 1602. Died 1675.—The learned bishop Newton, author of the *Dissertations on the Prophecies*. Born at Litchfield, 1703. Died 1782.—Rev. Stebbing Shaw, topographer. Born

at Stone, 1762. Died 1802.—Dr. G. Smaltridge, bishop of Bristol. Born at Litchfield, 1666. Died 1719.—The amiable Isaac Walton, the angler. Born at Stafford, 1593. Died 1683.—William Wollaston, a distinguished philosophical writer. Born at Coton Clomford, in 1659.—Josiah Wedgwood, the ingenious potter. Born 1731. Died 1795.—John Goodwin, the celebrated Arminian, was born in this county, at Newcastle, about 1593. Died 1665.—Nor should we by any means omit to mention the name of Sampson Erdeswicke, the genealogist and antiquary, who was born at Sandon. Died 1603.—William Mountfort, the actor, was born in this county in 1659. Died 1692.—Rev. R. Meadowcroft, critic and annotator on Milton. Born 1697. Died 1769.

This is a very important manufacturing county. The manufactures of hardware, glass, toys, japanned goods, potters' ware, cotton, silk, leather, woollen, linen, the making of brass from copper with lapis calaminaris, the dipping of iron plates to make what is called tin, &c. &c., are very extensive. The hardware manufacture is carried on to a very great extent; and Wolverhampton and its neighbourhood produce locks of every kind, and of the very best quality; buckles are also manufactured there. The steel toys, watch-chains, edge-tools, files, augers, and japanned goods of this town are unrivalled in their quality; shoe-buckles and chapes, sadlers' ironmongery, &c., are manufactured in great quantities at Walsall and the neighbourhood. The manufacture of nails in Staffordshire is exceedingly extensive, particularly at Ledgely, Rowley, Westbromwich, Smethwich, Wombourne, Pellsall, the Foreign of Walsall, and many other places. Plated, lackered, japanned, and even enamelled goods are made at Bilston. Wednesbury does something in the gun trade. Tobacco and snuff-boxes of iron or steel, and finished in various ways, are got up at Darlaston, Willenhull, and in their neighbourhood. Shoes, boots, and cutlery, both for home consumption and exportation; and the tanning, and other different branches of the leather trade, and also the manufacture of hats, are carried on upon a very large scale in Stafford and other towns in the county. Leek does a great deal of business in the silk and mohair way; the manufactured goods from which are sewing silks, twist, buttons, ribands, silk ferrets, shawls, and handkerchiefs. There are also some cotton mills in the neighbourhood, where west is spun for the Manchester market. Cheadle and Jean. have a considerable manufacture of tape. But neither the woollen nor linen manufactures are very large: cotton is spun in large quantities at Rocceter, Fazeley, and Tamworth, as also at Burton and Tutbury; the ale of the former place has been long celebrated. But the pottery manufacture is that for which, beside hardware, this county is most celebrated. This manufacture is chiefly carried on in the north of the county; and the name of Wedgwood is renowned throughout Europe for his inventions and discoveries in this business. The potteries consist of a number of scattered villages, occupying an extent of about ten miles. and may contain about 22,000 inhabitants, in-

cluding those who depend on them for employment and subsistence. The war had a lamentable effect on this trade, especially the war with America; but the prospects of the manufacturers have since brightened, and the population increased.

STAFFTREE. See CELASTRUS.

STAG, *n. s.* Goth. *stæk*; the male hind when his horns are grown. Thus Dan. *sta'g*, is the point of a horn. The male red deer; the male of the hind.

To the place a poor sequestered *stag*,
That from the hunter's aim had ta'en a hurt,
Did come to languish. *Shakspeare. As You Like it.*

The swift *stag* from under ground
Bore up his branching head. *Milton.*

The inhabitants of seas and skies shall change;
And fish on shore, and *stags* in air shall range. *Dryden.*

The *stag*
Hears his own feet, and thinks they sound like more,
And fears his hind legs will o'ertake his fore. *Pope.*

STAG, in zoology. See CERVUS.

STAG BEETLE. See LUCANUS.

STAGE, *n. s. & v. a.* Fr. *estage*, of Lat. *statio*. A floor raised to view, on which any thing is exhibited; the theatre; a place of scenic entertainments; a station of rest or pause on a journey: hence a single step of progress: to stage is to exhibit publicly (obsolete): a *stager*, a player; an old practitioner: the other compounds seem to need no explanation.

Those two Mytelene brethren, basely born, crept out of a small galliot unto the majesty of great kings. Herein admire the wonderful changes and chances of these worldly things, now up, now down, as if the life of man were not of much more certainty than a *stage* play. *Knolles's History.*

When we are born, we cry that we are come
To this great *stage* of fools. *Shakspeare. King Lear.*

I love the people;
But do not like to *stage* me to their eyes:
Though it do well, I do not relish well
Their loud applause. *Id. Measure for Measure.*

The quick comedians
Extemp'rally will *stage* us, and present
Our Alexandrian revels. *Id. Antony and Cleopatra.*
The changes and vicissitudes in wars are many;
but chiefly in the feats or *stages* of the war, the weapons, and the manner of the conduct. *Bacon's Essays.*

And much good do't you then,
Brave plush and velvet men:
Can feed on ort; and, safe in your stage clothes,
Dare quit, upon your oaths,
The *stagers* and the *stage* wrights too. *Ben Jonson.*
I've heard old cunning *stagers*
Say, fools for argument use wagers. *Hudibras.*

I shall put you in mind where it was you promised
to set out, or begin your first *stage*; and beseech you
to go before me as my guide. *Hammond's Practical Catechism.*

This rough-cast unhewn poetry was instead of
*stage*plays for one hundred and twenty years.
Dryden's Juvenal, Dedication.

One Livius Andronicus was the first *stage*-player in
Rome. *Id.*

I maintain, against the enemies of the *stage*, that
patterns of piety, decently represented, may second
the precepts. *Dryden.*

Some *stagers* of the wiser sort
Made all these idle wonderments their sport:
But he, who heard what every fool could stay,
Would never fix his thought but trim his time away. *Dryden.*

One experienced *stager*, that had baffled twenty
traps and tricks before, discovered the plot. *L'Estrange.*

Our next *stage* brought us to the mouth of the
Tiber. *Addison.*

The story was told me by a priest, as we travelled
in a *stage-coach*. *Id.*

From thence compelled by craft and age,
She makes the head or latest *stage*. *Prior.*

To prepare the soul to be a fit inhabitant of that
holy place to which we aspire, is to be brought to per-
fection by gradual advances through several hard and
laborious *stages* of discipline. *Rogers.*

When late their miry sides *stage-coaches* show,
And their stiff horses through the town move slow,
Then let the prudent walker shoes provide. *Gay.*

We must not expect that our journey through the
several *stages* of this life should be all smooth and
even. *Atterbury.*

The first *stage* of healing, or the discharge of mat-
ter, is by surgeons called digestion. *Sharp's Surgery.*

This is by some called the first *stage* of a consump-
tion, but I had rather call it an ill habit preparatory
to that distemper. *Blackmore.*

By opening a passage from Muscovy to China, and
marking the several *stages*, it was a journey of so
many days. *Baker.*

Men drop so fast, ere life's mid *stage* we tread,
Few know so many friends alive as dead. *Young.*

Knights, squires, and steeds must enter on the
stage. *Pope.*

Be by a parson cheated!
Had you been cunning *stagers*,
You might yourselves be treated
By captains and by majors. *Swift.*

The *STAGE*, in the modern drama, is the place
of action and representation included between
the pit and the scenes, and answering to the pro-
scenium or pulpitum of the ancients. See AM-
PHITHEATRE, and THEATRE.

STAG'GER, *v. n., v. a., & n. s.* Belg. *staggeren*,
of Goth. *staka*, to stumble. To reel or stum-
ble in walking; not to stand or walk steadily:
hence to hesitate; fall in doubt; give way: to
make to stagger; to revolt; shock; alarm: a
disease of the horse (used in the plural); ap-
plied also by Shakspeare to human madness.

He *staggered* not at the promise of God through
unbelief; but was strong in faith. *Romans* iv. 20.

A man may, if he were fearful, *stagger* in this
attempt. *Shakspeare.*

That hand shall burn in never quenching fire,
That *stagers* thus my person. *Id. Richard II.*

The question did at first so *stagger* me,
Bearing a state of mighty moment in't. *Id. Henry VIII.*

His horse past cure of the fives, stark spoiled with
the *stagers*. *Shakspeare.*

I will throw thee from my care for ever
Into the *stagers*, and the careless lapse
Of youth and ignorance. *Id.*

Three means to fortify belief are experience, rea-
son, and authority: of these the most potent is au-
thority; for belief upon reason, or experience, will
stagger. *Bacon.*

No hereticks desire to spread
Their light opinions like these Epicures;

For so their *staggering* thoughts are comforted,
And other men's assent their doubt assures.

Davies.

If thou confidently depend on the truth of this,
without any doubting or *staggering*, this will be ac-
cepted by God.

Hammond.

Whoever will read the story of this war, will
find himself much *staggered*, and put to a kind of
riddle.

Howel.

He began to appear sick and giddy, and to *stag-
ger*; after which he fell down as dead.

Boyle.

But let it inward sink and drown my mind:

Falsehood shall want its triumph: I begin

To *stagger*; but I'll prop myself within.

Dryden.

When a prince fails in honour and justice, 'tis
enough to *stagger* his people in their allegiance.

L'Estrange.

Them revelling the Tentyrites invade,
By giddy heads and *staggering* legs betrayed.

Tate.

The enemy *staggers*: if you follow your blow, he
falls at your feet; but, if you allow him respite, he
will recover his strength.

Addison.

The immediate forerunners of an apoplexy are a
vertigo, *staggering*, and loss of memory.

Arbuthnot.

The shells being lodged with the belemnites, sele-
nites, and other like natural fossils, it was enough
to *stagger* a spectator, and make him ready to entertain
a belief that these were so too.

Woodward.

STAGGERS. See VETERINARY ART.

STAGIRA, in ancient geography, a town on
the borders of Macedonia, near the bay of Con-
tessa, into which the Strymon runs, at the south
of Amphipolis; founded A. A. C. 665. It is
famous for being the birth place of Aristotle. It
is now called Lyba Nova, and lies sixteen miles
from Contessa.

STAGIRITE, a native of Stagira; an epithet
very generally given to Aristotle, by both ancient
and modern authors.

STAG'NANT, *adj.* } Latin *stagnans*. Mo-
STAG'NATE, *v. n.* } tionless; still; not agi-
STAGNA'TION, *n. s.* } tated; not flowing: to
lie or be motionless: the state of being so.

As the Alps surround Geneva on all sides, they
form a vast bason, where there would be a constan
stagnation of vapours, did not the north wind scatter
them from time to time.

Addison.

What does the flood from putrefaction keep!

Should it be *stagnant* in its ample seat,

The sun would through it spread destructive heat.

Blackmore.

To what great ends subservient is the wind!

Behold, where'er this active vapour flies,

It drives the clouds, and agitates the skies:

This from *stagnation* and corruption saves

The' aerial ocean's ever-rolling waves.

Id.

The aliment moving through the capillary tubes
stagnates, and unites itself to the vessel through
which it flows.

Arbuthnot.

'Twas owing to this hurry and action of the water
that the sand now was cast into layers, and not to a
regular settlement, from a water quiet and *stagnant*.

Woodward.

The water which now arises must have all *stag-
nated* at the surface, and could never possibly have
been refunded forth upon the earth, had not the
strata been thus raised up.

Id.

Where creeping waters ooze,

Where marshes *stagnate*.

Thomson.

Inmured and buried in perpetual sloth,

That gloomy slumber of the *stagnant* soul.

Irene.

STAHL (George Ernest), an eminent German
chemist, born in Franconia in 1660, and chosen

professor of medicine at Hall, when a university
was founded in that city in 1694. The excel-
lency of his lectures while he filled that chair,
the importance of his various publications, and
his extensive practice, soon raised his reputation
very high. He received an invitation to Berlin
in 1710, which having accepted, he was made
counsellor of state and physician to the king.
He died in 1734, in the seventy-fifth year of his
age. Stahl is without doubt one of the greatest
men of which the annals of medicine can boast;
his name marks the commencement of a new
era in chemistry. He was the author of the doc-
trine of phlogiston, which, though now com-
pletely overturned by the discoveries of Lavoisier
and others (see CHEMISTRY, Index), was
not without its use; as it served to combine the
scattered fragments of former chemists into a
system, and as it gave rise to more accurate ex-
periments and a more scientific view of the sub-
ject, to which many of the subsequent discov-
eries were owing. This theory maintained its
ground for more than half a century, and was
received and supported by some of the most
eminent men which Europe has produced; a
sufficient proof of the ingenuity and the abilities
of its author. He was the author also of A
Theory of Medicine, founded upon the notions,
which he entertained, of the absolute dominion
of mind over body; in consequence of which
he affirmed that every muscular action is a vo-
luntary action of the mind, whether attended
with consciousness or not. This theory he and
his followers carried a great deal too far, but
the advices which he gives to attend to the state
of the mind of the patient are worthy of the at-
tention of physicians. His principal works are,
1. *Experimenta et Observationes Chemicæ et
Physicæ*, Berlin, 1731, 8vo.; 2. *Dissertationes
Medicæ*, Hall, 2 vols. 4to. This is a collection of
theses. 3. *Theoria Medica vera*, 1737, 4to.;
4. *Opusculum Chymico-physico Medicum*, 1740,
4to.; 5. A Treatise on Sulphur, both Inflam-
mable and Fixed, written in German. 6. *Nego-
tium Otiosum*, Hall, 1720, 4to. It is in this
treatise chiefly that he establishes his system
concerning the action of the soul upon the body.
7. *Fundamenta Chymicæ Dogmaticæ et Expe-
rimentalis*, Nuremberg, 1747, 3 vols. 4to.; 8. A
Treatise on Salts written in German. 9. *Com-
mentarium in Metallurgiam Beccheri*, 1723.

STAHRMBERG (Conrad Balthasar), count
of, a brave German general, who was governor
of Vienna, when it was besieged by the Turks,
in 1683. He acquired great glory by the brave
defence he made of that city. He died at Vienna
in 1687.

STAHRMBERG (Guido Balde), count of, another
brave German general, born in 1657. He
displayed his military talents on various occa-
sions, particularly at the battle of Zenta, where
he commanded under prince Eugene. In 1710
he gained the battle of Saragossa; and distin-
guished himself greatly in Spain, in favor of the
archduke Charles. At the end of that war he
retired to Vienna, where he died in 1737.

STAIN, *v. a. & n. s.* } Isl. *stena*; Swed.

STAIN'LESS, *adj.* } *stana*; Goth. *steina*;

Welsh *ystaenio*. } To blot; spot; maculate;

hence to brand character; disgrace: the adjective corresponding.

Hereby I will lead her that is the praise, and yet the *stain*, of all womankind. *Sidney.*

The phenix wings are not so rare
For faultless length and *stainless* hue. *Id.*

Our opinion, concerning the force and virtue which such places have, is, I trust, without any blemish or *stain* of heresy. *Hooker.*

Lend me a looking-glass;
If that her breath will mist or *stain* the stone,
Why then she lives. *Shakspeare. King Lear.*

I cannot love him;
Yet I suppose him virtuous, know him noble,
Of great estate, of fresh and *stainless* youth.

Of honour void, of innocence, of faith, of purity,
Our wonted ornaments now soiled and *stained*.
Milton.

Then heaven and earth, renewed, shall be made
pure

To sanctify, that shall receive no *stain*. *Id.*
Embrace again, my sons; be foes no more,
Nor *stain* your country with your children's gore.
Dryden.

Nor death itself can wholly wash their *stains*,
But long contracted filth even in the soul remains,
The reliques of inveterate vice they wear,
And spots of sin. *Id. Æneid.*

We nowhere meet with a more pleasing show than what appears in the heavens at the rising and setting of the sun, which is wholly made up of those different *stains* of light that shew themselves in clouds of a different situation. *Addison.*

Swift trouts, diversified with crimson *stains*:
And pikes, the tyrants of the watery plains. *Pope.*

Ulysses bids his friends to cast lots; for, if he had made the choice himself, they whom he had rejected might have judged it a *stain* upon them for want of merit. *Broome.*

STAINES, a market town and parish in Spelthorne hundred, Middlesex, situate on the banks of the Thames, sixteen miles and a half west of London. The town is neat, and much improved of late years, and the market house, which stood in the centre of the street, has been removed. An iron bridge was erected across the river in 1803. The church is situate at some distance from the main part of the town. Here are chapels for quakers, and other dissenters, and also a Lancastrian school. The name is supposed to be derived from the Saxon word *Stana*, a stone, from the London markstone, which stands above the bridge at Coln Ditch, denoting the boundary of the jurisdiction of the city of London on the river; this stone bears the date of 1280. *Staines* is a lordship of the crown, and is governed by two constables, with four headboroughs, chosen annually by the king's stewards. Market on Friday. Fairs, May 11th, and September 10th. It is a vicarage, with Laleham and Ashford chapels annexed.

STAIR, *n. s.* † Sax. *fræger*; Belg. *steghe*; **STAIRCASE**. † Teut. *steige*; Goth. *stigr*. Steps by which we rise from the lower part of a building to the upper. Stair was anciently used for the whole order of steps; but stair now, if it be used at all, signifies, as in Milton, only one flight of steps: staircase is that part of a building which contains the stairs.

A good builder to a high tower will not make his

stair upright, but winding almost the full compass about, that the steepness be the more insensible. *Sidney.*

Slaver with lips as common as the *stairs*
That mount the capitol. *Shakspeare.*

I would have one only goodly room above *stairs*,
of some forty foot high. *Bacon's Essays.*

Sir James Tirrel repairing to the Tower by night attended by two servants, stood at the *stair-foot*, and sent these two villains to execute the murder. *Bacon.*

To make a complete *staircase* is a curious piece of architecture. *Wotton.*

The *stairs* were such as whereon Jacob saw
Angels ascending and descending.

Satan now on the lower *stair*,
That scaled by steps of gold to heaven gate,
Looks down with wonder at the sudden view
Of all this world. *Id.*

Trembling he springs,
As terror had increased his feet with wings;
Nor staid for *stairs*, but down the depth he threw
His body; on his back the door he drew. *Dryden.*

I cannot forbear mentioning a *staircase*, where the easiness of the ascent, the disposition of the light, and the convenient landing, are admirably contrived. *Addison on Italy.*

STAIRCASE, in architecture, is an ascent enclosed between walls, or a balustrade consisting of stairs or steps, with landing places and rails, serving to make a communication between the several stories of a house. See ARCHITECTURE, Index.

Vitruvius, in his description of the houses of the ancients, makes no mention of stairs; yet even in the supposition that these dwellings had only a ground floor, still means would be requisite to mount to the roof. Those staircases conducting to the upper stories of the lesser houses of Rome often ran up the outside of the building, and were secured by a separate door. From this it should seem that there was no interior communication between the several floors. The staircase was not, however, altogether an extraneous erection, but excavated, as it were, in the main wall of the building, and might have been intended to render the different stories more independent of each other—a desirable thing when each was occupied by a separate tenant. In their more recent constructions, however, as well as in houses of a higher order, the staircase was no doubt disposed much in the same manner as at the present day. The building called the country house, at Pompeii, and several others, have staircases of modern appearance, saving that they are narrow and uncommodious: the steps are sometimes a foot high. We find occasionally, likewise, private staircases, as in Pliny's Tuscan villa, where it was situated by the side of the dining-room, and destined for the use of the slaves who served the repast. There were also staircases in many of the ancient temples for the purpose of reaching the roof, &c.

In modern architecture, great skill is often displayed in the disposition of the staircase, in order that it may possess convenience of access without interfering with the handsome size and distribution of the various apartments. In houses of the middling size and character, it is

generally of wood; but in the residences of the nobility, as well as in public edifices, it is commonly constructed in stone or marble. In fact, this should always be done, where possible; since a double purpose is answered thereby: namely, solidity and freedom from prompt ignition in case of fire. One most desirable point is, to afford to all the several divisions of a staircase the strongest possible proportion of light. The balustrade should be light, and at the same time ornamental; and the wall on the other side, as well as the ceiling above, produces a fine effect if adorned with paintings, as in the mansions of many of our nobles. With regard to form, all kinds of varieties have been in use at different periods. The commonest shape is that in which right lines are employed. Circular staircases have often a very pleasant and handsome effect; but the artist must be a good deal regulated by his space, and the peculiar nature of the ground.

STAKE, *n. s.* & *v. a.* Saxon *staca*; Belg. *staeck*; Swed. *stake*; Ital. *stac*; Span. *estuca*. A post or strong stick fixed in the ground; something deposited or made fast: hence a pledge; wager: to fasten; support; pledge; wager; hazard.

The more I shook the *stake* which he had planted in the ground of my heart, the deeper still it sunk into it. *Sidney.*

His credit in the world might stand the poor town in great stead, as hitherto their ministers foreign estimation hath been the best *stake* in their hedge. *Hooker.*

He wanted pikes to set before his archers; Instead whereof sharp *stakes*, plucked out of hedges, They pitched in the ground. *Shakespeare. Henry VI.*

We are at the *stake*,
And bayed about with many enemies. *Id. Julius Cæsar.*

In France the grapes that make the wine grow upon low vines bound to small *stakes*, and the raised vines in arbors make but verjuice.

Bacon's Natural History.
When he heard that the lady Margaret was declared for it, he saw plainly that his kingdom must again be put to the *stake*, and that he must fight for it. *Id. Henry VII.*

That hollow I should know: what are you? speak: Come not too near, you fall on iron *stakes* else. *Milton.*

Are not our liberties, our lives,
The laws, religion, and our wives,
Enough at once to lie at *stake*,
For covenant and the cause's sake *Hudibras.*

'Tis time short pleasure now to take,
Of little life the best to make,
And manage wisely the last *stake.* *Cowley.*

O then, what interest shall I make
To save my last important *stake*,
When the most just have cause to quake? *Roscommon.*

He ventures little for so great a *stake.* *More.*
Or sharpen *stakes*, or head the forks, or twine
The sallow twigs to tie the straggl'ing vine. *Dryden.*

Of my crown thou too much care dost take;
That which I value more, my love, 's at *stake.* *Id.*
The' increasing sound is borne to either shore,
And for their *stakes* the throwing nations fear. *Id.*
Stake and bind up your weakest pations and flowers

against the winds, before they in a moment prostrate a whole year's labour. *Evelyn's Kalendar.*

The honour of the nation being in a manner at *stake* to make good several deficiencies. *Davenant.*

Is a man betrayed in his nearest concerns? The cause is, he relied upon the services of a pack of villains, who designed nothing but their own game, and to *stake* him while they played for themselves. *South.*

They durst not *stake* their present and future happiness on their own chimerical imaginations. *Addison.*

Every moment Cato's life's at *stake.* *Id.*
I'll *stake* yon' lamb that near the fountain plays,
And from the brink his dancing shade surveys. *Pope.*

Hath any of you a great interest at *stake* in a distant part of the world? Hath he ventured a good share of his fortune? *Atterbury.*

The game was so contrived that one participant cast took up the whole *stake*; and, when some others came up, you laid down. *Arbuthnot.*

STALACTICAL, *adj.* } Of Gr. *σταλαζω*.
STALACTITES, *n. s.* } Resembling an icicle: spars in the shape of an icicle.

A cave was lined with those *stalactical* stones on the top and sides. *Derham's Physico-Theology.*

Stalactites is only spar in the shape of an icicle, accidentally formed in the perpendicular fissures of the stone. *Woodward.*

STALACTITÆ. See next article.
STALACTITES, in mineralogy, are crystalline spars formed into oblong, conical, round, or irregular bodies, composed of various crusts, and usually found hanging in form of icicles from the roofs of grottoes, &c.

STALACTITICAL. See **STALACTICAL**; but **Stalactical**, by all the rules of analogy and derivation, ought to be preferred.

STALAGMITIS, in botany, a genus of the monœcia order, belonging to the polygamia class of plants; and in the natural method ranking under the thirty-eighth order, tricœcæ. The calyx is either quadriphyllous or hexaphyllous; the corolla consists of four or six petals: the receptacle is fleshy, and somewhat square-shaped; the filaments about thirty. In the hermaphrodite flower the stylus is short, thick, and erect; the fruit is a berry of a globular shape, unilocular, and crowned with the stylus and stigma: they contain three oblong jointed triangular seeds. Of this there is only one species, viz. *S. cambogioides*, a native of the East Indies, and of the warmer parts of America. From this plant is obtained the gutta cambogia, or gum gamboge of the shops. See **GAMBOGE**. Till very lately botanists were at a loss for the true nature of the plant which yields this gum. Koenig, a native of Ireland, and an excellent botanist, travelled over a great part of India, and collected a great number of new plants, and among the rest the stalagmitis. These he bequeathed to Sir Joseph Banks, president of the Royal Society.

STALBENT (Adrian), a landscape painter of Antwerp, born in 1580. His scenes are well chosen, and often solemn; his figures properly introduced; and his trees extremely natural. He died in 1660.

STALE, *adj.* & *v. a.* Sax. *stællian* (of Goth. *sta*, to stand); Belg. *stelle*. Old; long kept; altered by time: to make old; wear out. *Stale*, says Johnson, is not used of persons otherwise

tnan in contempt: except when it is applied to beer, it commonly means worse for age.

Age cannot wither her, nor custom *stale*
Her infinite variety.

Shakspeare. Antony and Cleopatra.

Were I a common laughter, or did use
To *stale* with ordinary oaths my love
To every new protestor.

Id. Julius Cæsar.

The beer and wine, as well within water as above,
have not been palled; but somewhat better than bot-
tles of the same drinks and *staleness* kept in a cellar.

Bacon's Natural History.

The duke regarded not the muttering multitude,
knowing that rumours grow *stale*, and vanish with
time.

Hayward.

All your promised mountains
And seas I am so *stalely* acquainted with.

Ben Jonson.

About her neck a paquet mail,
Fraught with advice, some fresh, some *stale*.

Hudibras.

Many things beget opinion; so doth novelty; wit
itself, if *stale*, is less taking.

Grew's Cosmologia.

A *stale* virgin sets up a shop in a place where she
is not known.

Spectator.

Provided our landlord's principles were sound, we
did not take any notice of the *staleness* of his pro-
visions.

Addison.

This, Richard, is a curious case:

Suppose your eyes sent equal rays

Upon two distant pots of ale,

Not knowing which was mild or *stale*;

In this sad state your doubtful choice

Would never have the casting voice.

Prior.

They reason and conclude by precedent,

And own *stale* nonsense which they ne'er invent.

Pope.

Pompey was a perfect favourite of the people; but
his pretensions grew *stale*, for want of a timely op-
portunity of introducing them upon the stage.

Swift.

STALE, *n. s.* From Sax. *rælan*, to steal.—
Johnson. But Mr. Thomson, from the verb
to *stale*, i. e. deposit, place. Something exhibited
or offered as an allurement to draw others to any
place or purpose: a prostitute. Obsolete.

His heart being wholly delighted in deceiving us,
we could never be warned; but rather one bird caught,
served for a *stale* to bring in more.

Sidney.

Still as he went he crafty *stales* did lay,

With cunning trains him to entrap unwares;

And privy spials placed in all his way,

To weet what course he takes and how he fares.

Spenser.

The trumpery in my house bring hither,
For *stale* to catch these thieves.

Shakspeare. Tempest.

I stand dishonoured, that have gone about
To link my dear friend to a common *stale*.

Shakspeare.

It may be a vizor for the hypocrite, and a *stale* for
the ambitious.

Decay of Piety.

This easy fool must be my *stale*, set up
To catch the people's eyes: he's tame and merciful,
Him I can manage.

Dryden's Don Sebastian.

A pretence of kindness is the universal *stale* to all
base projects; by this men are robbed of their for-
tunes, and women of their honour.

Government of the Tongue.

STALE, *n. s.* Belg. *stele*, a stick. A handle.

But, seeing the' arrow's *stale* without, and that the
head did goe

No further than it might be seen, he called his
spirits again.

Chapman.

It hath a long *stale* or handle, with a button at the
end for one's hand.

Mortimer's Husbandry.

STALE, *v. n.* From the noun, or rather from
the verb to *STALE*, deposit. To make water.

Having tied his beast t' a pale,

And taken time for both to *stale*.

Hudibras.

STALE, among sportsmen, a living fowl put in
a place to allure and bring others where they
may be taken. For want of these, a bird shot,
his entrails taken out, and dried in an oven in
his feathers, with a stick thrust through to keep
it in a convenient posture, may serve as well as
a live one.

STALIMENE, an island in the Grecian Ar-
chipelago, anciently called Lemnos; fifteen miles
long and eleven broad. It abounds with moun-
tains and fertile valleys, which produce much
fruit. Two of its mountains were anciently *voë*
canoes, whence the poets fabled it to be the place
where Vulcan kept his forges. See *LEMNOS*. It
is a Greek bishop's see. *Cochino*, the ancient
Hephestias, and Lemno, the ancient Myron, are
the two chief towns.

STALK, *n. s. & v. n.* } Sax. *rælg*, *rælcæn*;

STALK'INGHORSE, *n. s.* } Swed. *stak*. The stem

STALK'Y, *adj.* } of a plant; a stay; han-
dle; support: to walk with high and stately

steps. It is used commonly in a sense of dis-
like: a stalkinghorse is a real or fictitious horse
behind which a fowler conceals himself; a pre-
tence: stalky, stiff; like a stalk.

Behind it forth there leapt

An ugly fiend, more foul than dismal day;

The which with monstrous *stalk* behind him stept,

And ever as he went due watch upon him kept.

Spenser.

His monstrous enemy

With sturdy steps came *stalking* in his sight.

Id. Shall your city call us lord,

In that behalf by which we challenged it?

Or shall we give the signal to our rage,

And *stalk* in blood to our possession?

Shakspeare. King John.

The king asked how far it was to a certain town:
they said six miles. Half an hour after he asked
again: one said six miles and a half. The king
alighted out of his coach, and crept under the
shoulder of his led horse: and when some asked his
majesty what he meant, I must *stalk*, said he; for
yonder town is shy, and flies me.

Bacon's Apophthegms.

A stock-gillyflower, gently tied on a stick, put into
a steep glass full of quicksilver, so that the quicksilver
cover it; after five days you will find the flower fresh,
and the *stalk* harder and less flexible than it was.

Bacon.

Let the counsellor give counsel not for faction but
for conscience, forbearing to make the good of the
state the *stalkinghorse* of his private ends.

Hakewill on Providence.

Small store will serve, where store,

All seasons, ripe for use, hangs on the *stalk*.

Milton.

That amber attracts not basil, is wholly repugnant
unto truth; for, if the leaves thereof, or dried *stalks*,
be stripped unto small straws, they arise unto amber,
wax, and other electricks, no otherways than those of
wheat and rye.

Broune.

Unfold the' eternal door:

You see before the gate what *stalking* ghost

Commands the guard, what sentries keep the post.

Dryden.

Roses unbid, and every fragrant flower,
Flew from their stalks to strew thy nuptial bower.

Id.

They pass their precious hours in plays and sports,
Till death behind came *stalking* on unseen.

Id.

Hypocrisy is the devil's *stalking-horse*, under an affectation of simplicity and religion.

L'Estrange.

It grows upon a round *stalk*, and at the top bears a great *stalky* head.

Mortimer.

Viewed with a glass, they appear made up of little bladders, like those in the plume or *stalk* of a quill.

Grew.

Then *stalking* through the deep

He fords the ocean, while the topmast wave

Scarce reaches up his middle side.

Addison.

Great Milton next, with high and haughty *stalks*,
Unfettered in majestic numbers walks.

Id.

Vexatious thought still found my flying mind,

Nor bound by limits, nor to place confined;

Haunted my nights, and terrified my days,

Stalked through my gardens, and pursued my ways,
Nor shut from artful bower, nor lost in winding maze.

Prior.

Scornful turning from the shore

My haughty step, I *stalked* the valley o'er.

Id. Odyssey.

STALK, ANIMATED. This remarkable animal was found by Mr. Ives at Cuddalore; and he mentions several kinds of it: some appearing like dry straws tied together, others like grass; some have bodies much larger than others, with the addition of two scaly imperfect wings; their neck is no bigger than a pin, but twice as long as their bodies; their heads are like those of a hare, and their eyes vertical and very brisk. They live upon flies, and catch these insects very dexterously with the two fore feet, which they keep doubled up in three parts close to their head, and dart out very quick on the approach of their prey; and, when they have caught it, they eat it very voraciously, holding it in the same manner as a squirrel does its food. On the outer joints of the fore feet are several very sharp hooks for the easier catching and holding of their prey; while, with the other feet, which are four in number, they take hold of trees or any other thing, the better to surprise whatever they lie in wait for. They drink like a horse, putting their mouths into the water. Their excrements, which are very white, are almost as large as the body of the animal, and, as the natives say, dangerous to the eyes.

STALL, n. s. & v. a. } Sax. *ƿæal*; Belg.

STALL'FED, adj. } *stal*; Teut. *stall*; Ital.

stalla. Strictly, a fixed station, or abiding place: hence a crib in which an ox or horse is fed or kept; a shed, shop, or *depôt* for goods; the seat of a clergyman in a choir: to keep in a stall or stable; to instal; invest: *stallfed* is fed in a stall or with dry food.

Solomon had forty thousand *stalls* of horses.

1 Kings iv.

All these together in one heap were thrown,
Like carcasses of beasts in butcher's *stall*;

And in another corner wide were strown

The antique ruins of the Romans fall.

Spenser.

For such encheason, if you go nie,

Few chimneys reeking you will espy;

The fat ox, that won't lig in the stall,

Is now fast *stalled* in his crumenal.

Id. Pastorals.

Stalls, bulks, windows,

Are smothered up, leads filled, and ridges horsed

With variable complexions; all agreeing

In earnestness to see him. *Shakspeare. Coriolanus.*

For my part he keeps me rustically at home; or, to speak more properly, sties me here at home unkept: for call you that keeping, for a gentleman of my birth, that differs not from the *stalling* of an ox?

Shakspeare.

Long mayst thou live to wail thy children's loss;

And see another, as I see thee now,

Decked in thy rights as thou art *stalled* in mine.

Id.

We could not *stall* together in the world.

Id.

A herd of oxen then he carved, with high raised heads, forged all

Of gold and tin, for color mixt, and, bellowing from their *stall*,

Rushed to their pastures.

Chapman's Iliad.

Every one must every day sustaine

The load of one beast, the most fat and best

Of all the *stall-fed*, to the woer's feast.

Chapman.

They are nature's coarser wares that lie on the *stall*, exposed to the transient view of every common eye.

Glanville.

His fellow sought what lodging he could find;

At last he found a *stall* where oxen stood.

Dryden.

Nisus the forest passed,

And Alban plains, from Alba's name so called,

Where king Latinus then his oxen *stalled*.

Id.

Bess Hoy first found it troublesome to bawl,

And therefore placed her cherries on a *stall*.

King.

The pope creates a canon beyond the number limited, and commands the chapter to assign unto such canon a *stall* in the choir and place in the chapter.

Ayliffe's Purvargon.

Stall-fed oxen, and crammed fowls, are often diseased in their livers.

Arbutnot on Aliments.

How pedlars *stalls* with glittering toys are laid,

The various fairings of the country maid.

Gay.

Harley, the nation's great support,

Returning home one day from court,

Observed a parson near Whitehall

Cheapening old authors on a *stall*.

Swift.

The dignified clergy, out of mere humility, have called their thrones by the names of *stalls*.

Warburton.

STALLION, n. s. Welsh *ysdalwyn*. 'The one is derived from the other; but which from which I cannot certainly tell.'—Wotton. Fr. *estallion*; Ital. *stallone*; Belg. *stallhengst*. Junius thinks it derived from *ƿælan*, to leap. A horse kept for mares.

The present defects are breeding without choice of *stallions* in shape or size.

Temple.

If fleet Dragon's progeny at last

Prove jaded, and in frequent matches cast,

No favor for the *stallion* we retain,

And no respect for the degenerate strain.

Dryden.

STALLION, or STONE-HORSE, in the manege, is designed for the covering of mares, to propagate the species. He ought to be sound, well made, vigorous, and of a good breed. For fine saddle horses, foreign stallions, as Arabians, Turks, Barbs, and Andalusians, are preferable to all others. Next to these, British stallions are the best; because they originally sprang from those above-mentioned, and are very little degenerated. The stallions of Italy, and especially the Neapolitan, are very good. The best stallions for draught or carriage horses are those of Naples, Denmark, Holstein, and Freezeland. The stallions for saddle horses should be from fourteen to fifteen hands high, and for draught horses at least fifteen hands. Neither ought the color of stallions to be overlooked: as a fine black,

gray, bay, sorrel, &c. Besides these external qualities, a stallion ought to have courage, tractability, spirit, agility, a sensible mouth, sure limbs, &c. These precautions in the choice of a stallion are the more necessary, because he has been found by experience to communicate to his offspring almost all his good or bad qualities, whether natural or acquired. The mare contributes no less to the beauty of her offspring than the stallion; but she contributes perhaps more to their constitution and stature; for these reasons it is necessary that the mares for breed be perfectly sound, and make good nurses. For elegant horses, the Spanish and Italian mares are best; but, for draught horses, those of Britain and Normandy are preferable. However, when the stallions are good, the mares of any country will produce fine horses, provided they be well made and of a good breed. See HORSE.

STALL'WORN, *adj.* Stall and worn. Long kept in the stable. Probably a mistake for stalworth. Sax. *stapelþeð*, stout.

His *stallworn* steed the champion stout bestrode.

Shakspeare.

STAMEN, in botany, the male genital organ of plants, found generally within the corolla, near the pistil. Stamens were formerly called chives. They are various in number in different flowers, from one to some hundreds. This organ is essential to a plant, no one having yet been discovered, after the most careful research, that is destitute of it, either in the same flower with the pistils, or a separate one of the same species.

A stamen consists of three parts. 1. The filamentum, or filament, the part which supports the anther. 2. The anthera, placed on the filament, and the most essential part of all. 3. The pollen, or powder adhering to the anther.

STAMFORD, a borough and market town, consisting of five parishes, in Ness hundred, parts of Kesteven, Lincolnshire, eighty-six miles and a half north from London. It is situate on the river Welland, on the borders of Northamptonshire, and Rutlandshire. The houses are well built, and chiefly of freestone, covered with slate. The out-parish of St. Martin's, Stamford Bridge, which is situate in Northamptonshire, on the opposite side of the Welland, is reckoned a part of the town, and rated with it in the taxes. Some of the churches are well built, and adorned with lofty spires; two of them are so near together as to resemble one building; St. Martin's church contains some noble monuments. This town was anciently much more considerable, and had fourteen parish churches, but nearly half that number were destroyed during the wars of the houses of York and Lancaster. There were many friaries and hospitals in the neighbourhood; one of them, at the south end of Stamford Bridge, is now converted into an alms house, for a warden and twelve poor men, and there is another for the same kind, within the town; besides a school for girls on Dr. Bell's system, and numerous other charitable foundations. In early times this was a strong garrison town, and had a castle on the south side of the river; there was also another castle erected within the town, but no remains are to be seen of either. In the reign of Edward III. a

quarrel having arisen at the university of Oxford, among the students, many of them retired hither, and formed various literary establishments; but they were of short duration. The town is governed by a mayor, twelve aldermen, and twenty-four burgesses. It returns two members to parliament, the number of voters being about 500, and the returning officer the mayor. Here the custom of borough-English prevails, by which the younger son inherits from a father dying intestate. Over the Welland is a fine stone bridge of five arches. The town hall, at the end of the bridge, is a handsome building, and contains in it a guildhall, and a gaol. It has also a neat theatre, an assembly room, and near the town is a course for horse races. The chief trade of this town is in malt, coal, and freestone, which is chiefly promoted by the navigation of the Welland. Here is a commercial bank. Near this town is the elegant residence of the marquis of Exeter. Markets on Monday and Friday. Fairs, Tuesday before February 13th, Monday before Midlent, Monday before May 12th, and after Corpus-Christi, August 5th, and November 8th.

STAMINA, *n. s.* Lat. *stamina*. The first principles of any thing; the solids of a human body; in botany, those little fine threads or capillaments which grow up within the flowers of plants, encompassing round the style, and on which the apices grow at their extremities.

STAMINA, in the animal body, are those simple original parts which existed first in the embryo or the seed; and by whose distinction, augmentation, and accretion by additional juices, the animal body at its utmost bulk is supposed to be formed.

STAMINA, in botany, are those upright filaments which, on opening a flower, we find within the corolla surrounding the pistillum. They are the male organs of generation, and prepare the pollen. Each stamen consists of two parts, viz. the filamentum and the anthera. See BOTANY, Index.

STAM'MEL, *n. s.* From *darnel*, doc-colored. A species of red color.

Reedhood, the first that doth appear

In *stammel*: scarlet is too dear.

Ben Jonson.

STAM'MER, *v. n.* † Sax. *stamer*. Belg. **STAM'MERER**, *n. s.* † *stamelen*, *stameren*. To speak with unnatural hesitation; to utter words with difficulty: the noun substantive corresponding.

Sometimes to her news of myself to tell

I go about; but then is all my best

Wry words, and *stammering*, or else doltish dumb

Say then, can this but of enchantment come?

Sidney.

I would thou couldst *stammer*, that thou mightest pour out of thy mouth, as wine comes out of a narrow-mouthed bottle, either too much at once or none at all.

Shakspeare.

A *stammerer* cannot with moderation hope for the gift of tongues, or a peasant to become learned as Origen.

Taylor.

She *stammers*; oh, what grace in lispings lies;

If she says nothing, to be sure she's wise. *Dryden.*

Legean juice,

Which *stammering* tongues and staggering feet pour
duce.

Id.

Cornelius hoped he would come to *stammer* like Demosthenes. *Arbutnot's Martinus Scriblerus.*

Your hearers would rather you should be less correct, than perpetually *stammering*, which is one of the worst solecisms in rhetoric. *Swift.*

STAMMERING, in physiology, that hesitation or interruption of speech which seems generally to arise from fear, eagerness, or some violent passion, that prevents a child's articulating rightly, by the confusion which it occasions in the vibrations that descend into the muscular system. It does not therefore begin, in general, till children are of an age to distinguish right from wrong in respect of pronunciation, and to articulate with some kind of propriety. A nervous disorder of the muscles of speech may have a like effect.

When stammering has once begun to take place in a few words, it will extend itself to more and more from very slight resemblances, and particularly to all the first words of sentences, because then the organs pass in an instant from inactivity to action, whereas the subsequent parts of words and sentences may follow the foregoing from association; just as in repeating, memoriter, one is most apt to hesitate at the first word in each sentence. A defect of memory from passion, natural weakness, &c., so that the proper word does not occur readily, also occasions stammering, and, like all other modes of speaking, it is caught, in some cases, by imitation. Sometimes stammering takes place only in the utterance of such words as begin with certain letters, which are generally some of the labial or guttural consonants, as *b, p, m, c, g,* &c. Some persons, on the contrary, stammer in the utterance of all words indiscriminately, with whatever letter they begin, whether they be vowel or consonant, at certain times only; as *e. g.* when the speaker is placed in any situation that occasions hurry or embarrassment. Agreeably to the observations already made, we find that persons of great nervous irritability, and lively consciousness, are most liable to stammering. This sort of impediment is a bad habit, founded upon this constitutional susceptibility: and in attempting to remove stammering, while every attention should be paid to such means as physical and medical science will point out for the strengthening of the corporeal system, it is of the utmost importance to induce the persons affected with it to reason on the subject. Let them practise the formation of the component parts of words (that is, simple vocal sounds and the powers of the consonants), singly, and in combination, alternately, till a facility and habit of subjecting the muscles concerned in speech to the will be acquired or regained. They should be accustomed to consider that which is true in fact, that the organs of speech are moved by muscles which, from the laws of animal economy, are the instruments of the will; though we are conscious of an act of the will only at the commencement of such actions.

To counteract stammering, therefore, we are told, we must appeal to the understanding, and endeavour to arouse the will into vigilant and vigorous control of the muscles. When a hesitation happens, let a volition or direct act of

this power take place: first to cease muscular motion altogether, and then to commence a new series. The greatest deliberation and recollection should be used in ordinary conversation; and the act of speaking, as such, should be constantly present to the mind, till the wrong habit be overcome, and the right so confirmed as to leave no room to apprehend a relapse. The voice should be carefully pitched at that tone which nature in the individual points out as easiest to the organs, and most agreeable to the ear; and by no means should a hurried pronunciation, or fictitious voice, be resorted to. It should be studiously remembered that we are accountable to no one for the innocent and decorous exercise of our muscular powers—that over them we ourselves alone ought to have control—that speech, on proper occasions, is not only an innocent and a decorous, but, in the eyes of others, a necessary and an agreeable exercise of our muscles. Why then be thrown into perturbation and confusion, when we are to perform an action confessedly in our power; and which others have not only no right to prevent, but are desirous that we should perform? If this train of reasoning be fairly entered upon, many other arguments will suggest themselves, and must inevitably produce good.

The following directions, with variations according to circumstances, will be found to be attended with advantage. In order to raise a voice, or that material of which speech is formed, let the vowels be practised in a natural key, but with firmness and strength, for ten minutes or a quarter of an hour, at least, every morning. Then let the powers of the consonants be formed, in their order, singly, and variously combined with the vowels. After a little rest, if imagination supply a subject, by all means let an imaginary conversation take place for twenty minutes, half an hour, or even an hour, in a firm and natural tone of voice, using every effort of fancy, to suppose it directed to persons indiscriminately; that is, sometimes to servants, sometimes to equals in age and rank, and sometimes to elders, or those considered as superior in consequence and rank in society, from whatever cause. But, if imagination do not furnish a topic, then let the time be spent in reading, in a tone as nearly approaching to the ease of familiar conversation as possible, taking care to manage the fancy as above. This will furnish the lesson: and, after an interval of a few hours, the same sort of conversation or reading should be repeated, two or three times more in the course of a day. And, on mixing with real auditors, every exertion should be made to associate the ideas of their imaginary, with their actual presence.

These directions, it will be perceived, are founded upon the principle of the association of ideas; than which a more powerful principle, in the formation of human habits, cannot be conceived. An ingenious writer, whose observations we are now citing, is of opinion that it may be laid down as an incontrovertible position, that persons possessing an ordinary mental capacity, with an adequate share of industry and strength, may certainly overcome the habit

of stammering, by means such as here pointed out. See Instruction of the Deaf and Dumb, &c., by Joseph Watson, LL. D., 2 vols. 8vo., 1809.

STAMP, *v. a., v. n., & n. s.* } Belg. *stampen*;
 STAMP'ER, *n. s.* } Dan. *stampere*;
 Goth. and Swed. *stampe*. To strike by pressing the foot hastily downwards; strike with the foot; pound; impress; fix a mark by pressure; mint; form; coin; give a character to: as a verb neuter to strike the foot downwards: a stamp is an instrument for stamping; the thing marked or stamped; the impression or mark made; make; form; cast; currency: a stamper is a pounding instrument.

I took the calf you had made, burnt it with fire, and stamped and ground it very small. *Deut. ix. 21.*

The men shall howl at the noise of the stamping of the hoofs of his strong horses. *Jer. xlvii. 3.*

Out of mere ambition, you have made
 Your holy hat be stamped on the king's coin.
Shakespeare.

What a fool art thou,
 A ramping fool, to brag, to stamp, and swear,
 Upon my party! Thou cold-blooded slave,
 Hast thou not spoke like thunder on my side? *Id.*

If speaking truth
 In this fine age were not thought flattery,
 Such attribution should this Douglas have
 As not a soldier of this season's stamp
 Should go so general current through the world. *Id.*

Some apothecaries, upon stamping of coloquintida, have been put into a great scouring by the vapour only. *Bacon.*

But to the pure refined ore
 The stamp of kings imparts no more
 Worth, than the metal held before. *Carew.*

From the stamping mill it passeth through the crazing-mill; but of late times they mostly use wet stampers. *Id.*

These prodigious conceits in nature spring out of framing abstracted conceptions, instead of those easy and primary notions which nature stamps in all men of common sense. *Digby.*

Of the same stamp is that which is obtruded upon us, that an adamant suspends the attraction of the loadstone. *Browne's Vulgar Errors.*

Some other nymphs, with colours faint
 And pencil slow, may Cupid paint,
 And a weak heart in time destroy:
 She has a stamp, and prints the boy. *Waller.*

No constant reason of this can be given, but from the nature of man's mind, which hath this notion of a deity born with it, and stamped upon it; or is of such a frame that in the free use of itself it will find out God. *Tillotson.*

If Arcite thus deplore
 His sufferings, Palemon yet suffers more:
 He frets, he fumes, he stares, he stamps the ground;
 The hollow tower with clamours rings around.
Dryden.

'Tis gold so pure,
 It cannot bear the stamp without allay. *Id.*

When one man of an exemplary improbity charges another of the same stamp in a court of justice, he lies under the disadvantage of a strong suspicion. *L'Estrange.*

Though God has given us no innate ideas of himself; though he has stamped no original characters on our minds, wherein we may read his being; yet, having furnished us with those faculties our minds are endowed with, he hath not left himself without witness. *Locke.*

If two pennyweight of silver, marked with a certain impression, shall here in England be equivalent to three-pennyweight marked with another impression, they will not fail to stamp pieces of that fashion, and quickly carry away your silver. *Id.*

Where reason or scripture is expressed for any opinion, we may receive it as of divine authority; but it is not the strength of our own persuasions which can give it that stamp. *Id.*

There needs no positive law or sanction of God to stamp an obliquity upon such a disobedience. *South.*

The persons here reflected upon are of such a peculiar stamp of impiety that they seem formed into a kind of diabolical society for the finding out new experiments in vice. *Id.*

What titles had they had, if nature had not strove hard to thrust the worst deserving first,
 And stamped the noble mark of eldership
 Upon their baser metal?

Rowe's Ambitious Stepmother.
 There is such an echo among the old ruins and vaults, that, if you stamp but a little louder than ordinary, you hear the sound repeated. *Addison.*

At Venice they put out very curious stamps of the several edifices which are most famous for their beauty and magnificence. *Id. on Italy.*

Let a friend to the government relate to him a matter of fact, he gives him the lye in every look; but, if one of his own stamp should tell him that the king of Sweden would be suddenly at Perth, he hugs himself at the good news. *Addison.*

Here swells the shelf with Ogilby the great;
 There, stamped with arms, Newcastle shines complete. *Pope.*

They got to the top, which was flat and even, and, stamping upon it, they found it was hollow. *Swift.*

Indeed the paper stamp
 Did very much his genius cramp;
 And, since he could not spend his fire,
 He now intended to retire. *Id.*

What an unspeakable happiness would it be, to a man engaged in the pursuit of knowledge, if he had but a power of stamping his best sentiments upon his memory in indelible characters. *Watts.*

A king of heaven's own stamp, not vulgar make;
 Blessed in giving, and averse to take. *Harte.*

He cannot bear the astonishing delight,
 But starts, exclaims, and stamps, and raves, and dies. *Dennis.*

STAMP-DUTIES, in English law, are a branch of the perpetual revenue of this kingdom. They are a tax imposed upon all parchment and paper whereon any legal proceedings, or private instruments of almost any nature whatever are written: and also upon licenses for retailing wines, letting horses to hire, and numerous other purposes. And upon all almanacs, newspapers, advertisements, cards, dice, and pamphlets containing less than six sheets of paper. These imposts are very various, according to the nature of the thing stamped or taxed, rising gradually from one penny to ten pounds; and, indeed, in many cases, as legacies, administrations, conveyances, &c., to an amount proportioned to the property conveyed. The first institution of the Stamp-duties was by stat. 5 and 6 W. & M. c. 21; and they have since been increased to an amount which nothing but the absolute necessity of their being imposed could prevent us from styling enormous. These duties are managed by commissioners appointed for the purpose. They now extend to such an astonishing variety of articles, and de-

pend on such a multiplicity of statutes, which are continually varying (by increasing) the amount, that no table or compendium which could be framed, would probably be of any service to the reader after one session of parliament; nor would it be consistent with the general nature of a work like the present to enter into any further elucidation of the subject.

STANCH, *v. a., v. n., & adj.* } Fr. *estancher*;
STANCH'LESS, *adj.* } Ital. *stagnare*.
To stop blood; hinder from running: to stop: as an adjective firm; sound; trusty: stanchless is, not to be stopped.

A woman touched the hem of his garment and immediately her issue *stanch'd*. Luke viii. 44.

If I knew
What hoop would hold us *stanch* from edge to edge
O' th' world, I would pursue it.

Shakspeare. *Antony and Cleopatra*.

There grows,
In my most ill-composed affection, such
A *stanchless* avarice, that, were I king,
I should cut off the nobles for their lands.

Id. *Macbeth*.

Iron or a stone, laid to the neck, doth *stanch* the
bleeding of the nose. *Bacon's Natural History*.
She unto Scythia sent, for hunger him to gnaw,
And thrust her down his throat, into his *stanchless*
maw. *Drayton*.

Leeches, inwardly taken, fasten upon the veins,
and occasion an effusion of blood, which cannot be
easily *stanch'd*. *Browne's Vulgar Errors*.

What we endeavoured in vain may be performed
by some virtuous that shall have *stancher* vessels, and
more sunny days. *Boyle*.

He fought to hinder fighting, and assayed
To *stanch* the blood by breathing of the vein.

Dryden.

You will lose their love; this is to be kept *stanch*,
and carefully watched. *Locke*.

The standing absurdity, without the belief of which
no man is reckoned a *stanch* churchman, is, that there
is a calf's-head club. *Adairson*.

In politicks, I hear, you're *stanch*,
Directly bent against the French. *Prior*.

They mean to convince, not the grovelling herd,
or giddy populace, but the grave and *stanch* men,
men of sobriety and firmness. *Waterland*.

Each *stanch* polemic still expelling Locke,
Each fierce logician still expelling Locke,
Came whip and spur. *Pope*.

STANCHIONS are small pillars of wood or
iron, used for various purposes in a ship; as to
support the decks, the quarter-rails, the nettings,
the awnings, &c. The first of these are two
ranges of small columns fixed under the beams,
throughout the ship's length between decks; one
range being on the starboard and the other on
the larboard side of the hatchways. They are
chiefly intended to support the weight of the
artillery.

STAND, *v. n., v. a., & n. s.* } Sax. *standan*
STANDER, *n. s.* } Goth. and Swed.

standa; Teut. *standen*. To be on the feet; be
erect; stop; stay; halt: hence to support; per-
sist; hold good; remain in force or consistent;
abide by: taking by, for, off, out, to, under, up,
upon, &c., as prepositions, whose use is exem-
plified below: to stand, as a verb active, is to
endure; resist without flinching; await; abide:
as a noun substantive, a station; post; stop;
difficulty; perplexity; mark; acme; support: a

stander is one who stands; a tree that has long
stood: a stander-by is one present; a mere
spectator.

I stood between the Lord and you, to shew you
the Lord's word. *Deut. v. 5*.

The king granted the Jews to gather themselves
together, and stand for their life. *Esth. viii. 11*.

My mercy will I keep for him, and my covenant
shall stand fast with him. *Psalms lxxxiv. 28*.

Stand in awe and sin not; commune with your
own heart upon your bed, and be still. *Id. iv. 4*.

Their eyes stand out with fatness. *Id. lxxiii. 7*.
He turned the wilderness into a standing water.
Id. cvii.

I will punish you, that ye may know that my
words shall surely stand against you for evil.

Jer. xlv. 29.

When the accusers stood up, they brought none ac-
cusation of such things as I supposed. *Acts xxv. 18*.

If meat make my brother offend, I will eat no
flesh while the world standeth. *1 Cor. viii. 13*.

Watch ye, stand fast in the faith, quit you like
men, be strong. *Id. xvi. 13*.

Put on the whole armour of God, that ye may be
able to stand against the wiles of the devil.

Eph. vi. 11.

That could not make him that did the service
perfect, as pertaining to the conscience, which stood
only in meats and drinks. *Heb. ix. 10*.

The young spring was pitifully nipt and overtrod-
den by very beasts; and also the fairest standers of all
were rooted up and cast into the fire.

Ascham's Schoolmaster.

God was not ignorant that the judges, whose sen-
tence in matters of controversy he ordained should
stand, oftentimes would be deceived. *Hooker*.

The cause must be presumed as good on our part
as on theirs, till it be decided who have stood for the
truth, and who for error. *Id.*

His faithful people, whatsoever they rightly ask,
the same shall they receive, so far as may stand with
the glory of God and their own everlasting good;
unto either of which it is no virtuous man's purpose
to seek any thing prejudicial. *Id.*

Explain some statute of the land to the standers by.

Id.

This reply standeth all by conjectures. *Whitgift*.

If he would presently yield, Barbarossa promised
to let him go free; but, if he should stand upon his
defence, he threatened to make him repent his foolish
hardiness. *Knolles*.

Such ordnance as he brought with him, because it
was fitter for service in field than for battery, did only
beat down the battlements, and such little standings.

Id. History.

Thou shalt see me at Tullus' face:

What, art thou stiff? stand'st out? *Shakspeare*.

If you unite in your complaints,
And force them with a constancy, the cardinal
Cannot stand under them. *Id. Henry VIII*.

Does it not stand me now upon? *Id. Hamlet*.

A rascally, yea-forsooth knave, to bear a gentleman
in hand, and then stand upon security. *Shakspeare*.

None durst stand him;
Here, there, and every where, enraged he flew. *Id.*

I have found you out a stand most fit,
Where you may have such vantage on the duke,
He shall not pass you. *Id. Measure for Measure*.

We are come off
Like Romans; neither foolish in our stands,
Nor cowardly in retire. *Shakspeare*.

The leaders, having charge from you to stand;
Will not go off until they hear you speak. *Id.*

Seeing how lothly opposite I stood
To his unnatural purpose, in fell motion

With his prepared sword he charges home
My unprovided body. *Id. King Lear.*
From enemies heaven keep your majesty ;
And, when they stand against you, may they fall.
Shakspeare.

A thing within my bosom tells me,
That no conditions of our peace can stand.
Id. Henry VI.

My very enemy's dog,
Though he had bit me, should have stood that night
Against my fire. *Id. King Lear.*

So it stands: and this I fear at last,
Hume's knavery will be the duchess' wreck.
Id. Henry VI.

The broil doubtful long stood,
As two spent swimmers that do cling together
And choke their art. *Shakspeare.*

It remains,
To gratify his noble service, that
Hath thus stood for his country. *Id. Coriolanus.*

The fool hath planted in his memory
An army of good words; and I do know
A many fools that stand in better place,
Garnished like him, that for a tricky word
Defy the matter. *Id. Merchant of Venice.*

YourselF, renowned prince, then stood as fair
As any comer I have looked on,
For my affection. *Id.*

I'll tell you who time ambles withal, who time
gallops withal.—Whom stands it still withal?—With
lawyers in the vacation; for they sleep between term
and term, and then they perceive not how time moves.
Shakspeare.

Have I lived to stand in the taunt of one that makes
fritters of English? *Id. Merry Wives.*

Stand no more off,
But give thyself upon my sick desires. *Shakspeare.*

There's his chamber,
His standing bed and truckle bed. *Id.*
The king knowing well that it stood him upon, by
how much the more he had hitherto protracted the
time, by so much the sooner to dispatch with the
rebels. *Bacon.*

The greatest part of trade is driven by young mer-
chants, upon borrowing at interest; so as, if the
user either call in or keep back his money, there
will ensue presently a great stand of trade. *Id.*

This nation of Spain runs a race still of empire,
when all other states of Christendom stand at a stay.
Id.

Their lives and fortunes were put in safety, whether
they stood to it or ran away. *Id. Henry VII.*

Our company assembled, I said, My dear friends,
let us know ourselves, and how it standeth with us.
Bacon.

A philosopher disputed with Adrian the emperor,
and did it but weakly: one of his friends, that stood
by, said, Methinks you were not like yourself last
day in argument with the emperor; I could have
answered better myself. Why, said the philosopher,
would you have me contend with him that commands
thirty legions? *Id.*

It is so plain that it needeth not to be stood upon.
Id.

His coming is in state; I will provide you a good
standing to see his entry. *Id.*

It was by the sword they should die, if they stood
upon defence; and by the halter, if they should
yield. *Hayward.*

All which grace
I now will amplify, and tell what cause
Thy household stands in. *Chapman.*

Then the lightning-loving Deity cast
A foule flight on my soldiers: nor stood fast
One man of all, *Id.*

Freedom we all stand for. *Ben Jonson.*
Pontinius knows not you,
While you stand out upon these traiterous terms. *Id.*

Picture is best when it standeth off as if it were
carved; and sculpture is best when it appeareth so
tender as if it were painted, when there is such a soft-
ness in the limbs as if not a chissel had hewed them
out of stone, but a pencil had drawn and strooked
them in oil. *Wotton's Architecture.*

The hirelings stand at a certain wages. *Carew.*
He that will pass his land,
As I have mine, may set his hand

And heart unto this deed, when he hath read ;
And make the purchase spread
To both our goods, if he to it will stand. *Herbert.*

We make all our addresses to the promises, hug
and caress them, and in the interim let the commands
stand by neglected. *Decay of Piety.*

Despair would stand to the sword,
To try what friends would do, or fate afford.
Daniel.

Father, since your fortune did attain
So high a stand, I mean not to descend. *Id.*
Some instances of fortune cannot stand with some
others; but if you desire this you must lose that.

Taylor.
Never stand in a lye when thou art accused; but
ask pardon and make amends.

Id. Rule of Living Holy.
The standers by see clearly this event,
All parties say they're sure, yet all dissent.

Denham.
At the soldierly word stand, the flyers halted a
little. *Clarendon.*

The earl of Northampton followed the horse so
closely that they made a stand, when he furiously
charged and routed them. *Id.*

This excellent man, who stood not upon the ad-
vantage ground before, provoked men of all qualities.
Id.

The presbyterians of the kirk, less forward to de-
clare their opinion in the former point, stand upon
the latter only. *Sanderson.*

He stood to be elected one of the proctors for the
university. *Id. Life.*

Then from his lofty stand on that high tree
Down he alights among the sportful herds. *Milton.*

To stand or fall,
Free in thine own arbitrement it lies. *Id.*
Chariot and chariotæer lay overturned,
And fiery foaming steeds: what stood, recoiled
O'erwearièd through the faint Satanick host,
Defensive scarce; or, with pale fear surprisèd,
Fled ignominious. *Id. Paradise Lost.*

The sea,
Awed by the rod of Moses so to stand,
Divided. *Milton.*

Chariots winged
From the armoury of God, where stand of old
Myriads. *Id.*

I in thy persevering shall rejoice,
And all the blest stand fast. *Id.*
Why stand we longer shivering under fears? *Id.*

This made their flowing shrink
From standing lake to tripping ebb. *Id.*

It stands me much upon
T' enervate this objection. *Hudibras.*

We are often constrained to stand alone against the
strength of opinion.

Browne's Preface to Vulgar Errors.
Men stand very much upon the reputation of their
understandings, and of all things hate to be accounted
fools; the best way to avoid this imputation is to be
religious. *Tillotson.*

The wand did not really *stand* to the metals, when placed under it, or the metalline veins. *Boyle.*

I will *stand* to it that this is his sense, as will appear from the design of his words. *Stillingfleet.*

Standing armies have the place of subjects, and the government depends upon the contented and discontented humours of the soldiers. *Temple.*

If the ladies will *stand out*, let them remember that the jury is not all agreed. *Dryden.*

Palinurus cried aloud,
What gusts of weather from that gathering cloud
My thoughts presage! ere that the tempest roars
Stand to your tackles, mates, and stretch your oars. *Id.*

Turning at the length, he *stood* his ground,
And missed his friend. *Id.*
After supper a *stand* was brought in, with a brass vessel full of wine, of which he that pleased might drink; but no liquor was forced. *Id. Life of Cleomenes.*

At every turn she made a little *stand*,
And thrust among the thorns her lily hand
To draw the rose. *Dryden.*
Mute, and amazed, my hair with horror *stood*;
Fear shrunk my senses, and congealed my blood. *Id.*

Her hair *stood* up; convulsive rage possessed
Her trembling limbs. *Id. Æneid.*
My mind on its own centre *stands* unmoved,
And, stable as the fabrick of the world,
Propt on itself. *Dryden.*

That sots and knaves should be so vain
To wish their vile resemblance may remain;
And *stand* recorded, at their own request,
To future days a libel or a jest! *Id.*
Where Ufens glides along the lowly lands,
Or the black water of Pomptina *stands*. *Id.*
If we meet with a repulse, we must throw off the fox's skin, and put on the lion's: come, gentlemen, you'll *stand* by me. *Id. Spanish Fryar.*
Stand off, and let me take my fill of death. *Dryden.*

Laughed all the powers who favour tyranny,
And all the *standing* army of the sky. *Id.*
A fool may so far imitate the mien of a wise man, as at first to put a body to a *stand* what to make of him. *L'Estrange.*

The ass hoped the dog would *stand* by him, if set upon by the wolf. *Id.*
He that will know, must by the connexion of the proofs see the truth and the ground it *stands* on. *Locke.*

I will not trouble myself, whether these names *stand* for the same thing, or really include one another. *Id.*

They will suspect they shall make but small progress, if, in the books they read, they must *stand* to examine and unravel every argument. *Id.*

Money being looked upon as the *standing* measure of other commodities, men consider it as a *standing* measure; y though, when it has varied its quantity, it is not so. *Id.*

We highly esteem and *stand* much upon our birth, though we derive nothing from our ancestors but our bodies; and it is useful to improve this advantage, to imitate their good examples. *Ray on the Creation.*

Oh! had bounteous heaven
Bestowed Hippolitus on Phædra's arms,
So had I *stood* the shock of angry fate. *Smith.*

Let not men flatter themselves, that though they find it difficult at present to combat and *stand out* against an ill practice, yet that old age will do that for them, which they in their youth could never find in their hearts to do for themselves. *South.*

An utter unsuitableness disobedience has to the relation which man necessarily *stands* in towards his Maker. *Id.*

When just as by her *stand* Arsaces past,
The window by design or chance fell down,
And to his view exposed her blushing beauties. *Howe.*

He was a gentleman of considerable practice at the bar, and *stood* fair for the first vacancy on the bench. *Id.*

Bid him disband the legions,
Submit his actions to the publick censure,
And *stand* the judgment of a Roman senate. *Id. Addison's Cato.*

The male bird, whilst the hen is covering her eggs, generally takes his *stand* upon a neighbouring bough, and diverts her with his songs during her sitting. *Id. Spectator.*

Three persons entered into a conspiracy to assassinate Timoleon, as he was offering up his devotions in a certain temple: in order to it they took their several *stands* in the most convenient places. *Id. Addison.*

The *standers* by suspected her to be a duchess. *Id.*

This poet's tomb *stood* on the other side of Naples, which looks towards Vesuvio. *Id. On Italy.*

Readers, by whose judgment I would *stand* or fall, would not be such as are acquainted only with the French and Italian critics. *Id. Spectator.*

He struck the snakes, and *stood* again
New sexed, and straight recovered into man. *Id. Addison.*

Each thinks he *stands* fairest for the great lot, and that he is possessed of the golden number. *Id. Spectator.*

Such a one, by pretending to distinguish himself from the herd, becomes a *standing* object of raillery. *Id. Addison.*

When famed Varelst this little wonder drew
Flora vouchsafed the growing work to view,
Finding the painter's science at a *stand*,
The goddess snatched the pencil from his hand;
And, finishing the piece, she smiling said,
Behold one work of mine that ne'er shall fade. *Prior.*

Such behaviour frights away friendship, and makes it *stand off* in dislike and aversion. *Collier of Friendship.*

Should this circulation cease, the formation of bodies would be at an end, and nature at a perfect *stand*. *Woodward.*

Although the ancients were of opinion that Egypt was formerly sea; yet this tract of land is as old, and of as long a *standing*, as any upon the continent of Africa. *Id.*

Scarce can a good-natured man refuse a compliance with the solicitations of his company, and *stand out* against the raillery of his familiars. *Rogers.*

Thus doth he advise them to erect among themselves *standing* courts by consent. *Kettleworth.*

They expect to be favoured, who *stand* not possessed of any one of those qualifications that belonged to him. *Atterbury.*

Though nothing can be more honourable than an acquaintance with God, we *stand off* from it, and will not be tempted to embrace it. *Id.*

The common *standing* rules of the gospel are a more powerful means of conviction than any miracle. *Id.*

Sprightly youth and close application will hardly *stand* together. *Felton.*

Amongst liquids endued with this quality of relaxing, warm water *stands* first. *Arbuthnot on Aliments.*

Some middle prices shew us in what proportion the value of their lands stood, in regard to those of our own country. *Arbutnot.*

The sea, since the memory of all ages, hath continued at a stand, without considerable variation. *Bentley.*

That not for fame, but virtue's better end,
He stood the furious foe, the timid friend,
The damning critick. *Pope.*

Immense the power, immense were the demand,
Say, at what part of nature will they stand? *Id.*

Persians and Greeks like turns of nature found,
And the world's victor stood subdued by sound. *Id.*
Full for the port the Ithacensians stand,
And furl their sails, and issue on the land. *Id. Odysseu.*

The world is inclined to stand by the Arundelian marble. *Id. Essay on Homer.*

Great standing miracle that heaven assigned;
'Tis only thinking gives this turn of mind. *Pope.*

The urchin from his private stand
Took aim and shot with all his strength. *Swift.*
Stand by when he is going. *Id.*

I wish your fortune had enabled you to have continued longer in the university, till you were of ten years standing. *Id.*

The emperors standing upon the advantage he had got by the seizure of their fleet, obliged them to deliver. *Gulliver's Travels.*

Theology would truly enlarge the mind, were it studied with that freedom and that sacred charity which it teaches: let this therefore stand always chief. *Watts.*

God, who sees all things intuitively, does not want these helps; he neither stands in need of logick, nor uses it. *Baker.*

STAND, in commerce, a weight from two hundred-weight and a half to three hundred-weight of pitch.

STANDARD, *n. s.* } Fr. *estandard*; Swed.

STANDARD-BEARER. } *standa*; Belg. *standaert*; Ital. *standardo*. An ensign in war, particularly the ensign of the horse. This word is originally derived from stand: hence it also signifies a test; that which is of standing or undoubted authority; a settled rate; that which has been tested; a standing stem or tree: the standardbearer is he who carries a military standard.

They shall be as when a standardbearer fainteth. *Isa. x. 18.*

The device of king Henry VII. was profound, in making farms of a standard, that is, maintained with such a proportion of lands as may breed a subject to live in plenty. *Bacon.*

A standard of a damask rose, with the root on, was set upright in an earthen pan, full of fair water, half a foot under the water, the standard being more than two foot above it. *Id. Natural History.*

His armies, in the following day,
On those fair plains their standards proud display. *Fairfax.*

Erect the standard there of ancient night,
Yours be the advantage all, mine the revenge. *Milton.*

The dogmatist gives the lye to all dissenting apprehenders, and proclaims his judgment the fittest intellectual standard. *Glanville.*

Our measures of length I cannot call standards, for standard measures must be certain and fixed. *Holder.*

A standard might be made, under which no horse should be used for draught; this would enlarge the breed of horses. *Temple.*

In France, part of their gardens is laid out for flowers, others for fruits; some standards, some against walls. *Temple.*

Behold Camillus loaded home
With standards well redeemed, and foreign foes overcome. *Dryden.*

When people have brought right and wrong to a false standard, there follows an envious malevolence. *L'Estrange.*

That precise weight and fineness, by law appropriated to the pieces of each denomination, is called the standard. *Locke.*

Plant fruit of all sorts and standard, mural, or shrubs which lose their leaf. *Evelyn's Kalendar.*

The Romans made those times the standard of their wit, when they subdued the world. *Sprat.*

These are the standardbearers in our contending armies, the dwarfs and squires who carry the impresses of the giants or knights. *Spectator.*

In comely rank call every merit forth;
Imprint on every act its standard worth. *Prior.*

When I shall propose the standard whereby I give judgment, any may easily inform himself of the quantity and measure of it. *Woodward.*

By the present standard of the coinage, sixty-two shillings is coined out of one pound weight of silver. *Arbutnot.*

From these ancient standards I descend to our own historians. *Felton.*

First follow nature, and your judgment frame
By her just standard, which is still the same. *Pope.*

The English tongue, if refined to a certain standard, perhaps might be fixed for ever. *Swift.*

STANDARD, in commerce, the original of a weight, measure, or coin, committed to the keeping of a magistrate, or deposited in some public place, to regulate, adjust, and try the weights used by particular persons in traffic. See MONEY.

STANDARD, is used among goldsmiths synonymously with sterling; thus standard or sterling gold or silver means gold or silver of equal purity with the gold or silver coin of Great Britain.

STANDARD (from the Fr. *estandard*, &c., *signum vexillum*), in the general signification, is an ensign in war. And it is used for the standing measure of the king, to the scantling whereof all the measures in the land are, or ought to be, framed, by the clerks of markets, aulnagers, or other officers, according to Magna Charta and divers statutes. This is not without good reason called a standard, because it standeth constant and immoveable, having all measures coming towards it for their conformity; even soldiers in the field have their standard or colors, for their direction in their march, &c., to repair to. Britton, c. 30. There is a standard of money, directing what quantity of fine silver and gold, and how much alloy, are to be contained in coin of old sterling, &c. And standard of plate and silver manufactures. Stat. 6 Geo. I., c. 11. See COINS, WEIGHTS, and MEASURES.

STANDARD, in war, is a sort of banner or flag, carried as a signal for joining together the several troops belonging to the same body.

The military standard is usually a piece of silk one foot and a half square, on which are embroidered the arms, device, or cypher, of the prince or colonel of a regiment. It is fixed on a lance, eight or nine feet long, and carried in the centre of the first rank of a squadron of horse, by the cornet.

STANDARDS BELONGING TO THE CAVALRY. Standards are posted in the following manner:—The king's with the right squadron. The second with the left; and the third with the centre. In advancing to the front on foot, the advanced standards and their serjeants must not slacken their pace, or deviate from right to left, as the lieutenant-colonel, or leading-officer, may happen to do; but if he be in their way they must call to him, because they alone regulate the march. The standards must always be brought to the parade by the troop, viz., by that which has its private parade nearest to head-quarters. They must be accompanied by as many trumpeters as can conveniently assemble with that troop. Swords must be drawn and the march sounded. The cornets parade, of course, with that troop to receive the standards. The standards are received by the regiment, or squadron, at open ranks, with swords drawn, officers saluting, and the march sounding by the remaining trumpeters. They must march off from head-quarters, and be lodged with the same form.

STANDARD-HILL, the Durolerum of the Romans, a hill of England, in Kent, south of Newington, by Sittingbourne, on which it is said Julius Cæsar encamped. Also a hill in Sussex, near Battel, now called Beacon-hill, where William the Conqueror raised his standard the day before the battle of Hastings.

STANDARDUS, true standard, or legal weight or measure.—Cartular S. Edmund, MS. 268.

STAN'DEL, *n. s.* From stand. A tree of long standing.

The Druiians were nettled to see the princely *standel* of their royal oak return with a branch of willows. *Howel.*

STANDISH, *n. s.* Stand and dish. A case for pen and ink.

A Grubstreet patriot does not write to secure, but get something: should the government be overturned, he has nothing to lose but an old *standish*. *Addison.*

I bequest to Dean Swift, esquire, my large silver *standish*, consisting of a large silver plate, an ink-pot, and a sand-box. *Swift.*

STANDON, a market-town and parish in Braughin hundred, Herts, situate on the river Rib, eight miles north-east from Hertford, and twenty-seven from London. The church has nothing remarkable, except that the chancel floor is elevated seven steps above the level of the church, and the altar three steps above the chancel. Market on Friday. Fair, October 13th. It is a vicarage.

STANEMORE, a barren district of Westmoreland, in the east corner of the county. It has relics of Rerecross, an ancient boundary between Scotland and England, set up when Cumberland belonged to the former.

STANG, *n. s.* Sax. *ŕæng*. A perch.

These fields were intermingled with woods of half a *stang*, and the tallest tree appeared to be seven feet high. *Swift.*

STANHOPE (George), D. D., an eminent divine, born at Hertishorn in Derbyshire, in 1660. His father was rector of that place, vicar of St. Margaret's church in Leicester, and chap-

lain to the earls of Chesterfield and Clare. His grandfather, also Dr. George Stanhope, was chaplain to James I. and Charles I.; chancellor, canon, residentiary, and a prebend of York, and was rector of Wel Drake. He was for his loyalty driven from his home with eleven children; and died in 1644. Our author was sent to school, first at Uppingham in Rutland, then at Leicester; afterwards removed to Eaton; and thence chosen to King's College in Cambridge. He took the degree of B. A. in 1681; A. M. 1658; was elected minister of Qoi near Cambridge, and vice proctor 1688; and rector of Tring in Hertfordshire. He was in 1689 appointed vicar of Lewisham in Kent, by lord Dartmouth, to whom he had been chaplain. He was also appointed chaplain to William and Mary, and continued under queen Anne. He commenced D. D. July 5th, 1697; and was made vicar of Deptford, and dean of Canterbury in 1703; thrice chosen prolocutor of the lower house of convocation. He was endowed with excellent parts, and acquired a large stock of learning, with the purest diction, and a just elocution. The character of the Christian and the gentleman in him were happily united. He died March 18th, 1728, aged sixty-eight. The dean was twice married: 1. to Olivia Cotton, by whom he had one son and four daughters; 2. To a sister of Sir Charles Wager, who survived him till October 1st, 1730, aged fifty-four. One of his daughters was married to a son of bishop Burnet. His writings are, A Paraphrase and Comment upon the Epistles and Gospels, 4 vols., 1705, 8vo.; Sermons at Boyle's Lectures, 1706, 4to.; Fifteen Sermons, 1700, 8vo.; Twelve Sermons, 1727, 8vo.; Parson's Christian Directory, 1716, 8vo.; A Funeral Sermon on Mr. Richard Stare, bookseller, 1724, 4to.; Twenty Sermons, between 1692 and 1724; Private Prayers, translated from the Greek of bishop Andrews, with Additions, 1730. He also published editions of Epictetus, Thomas à Kempis, and Rochefoucault.

STANHOPE (Philip Dormer), earl of Chesterfield, was born in 1695, and educated in Trinity-Hall, Cambridge; which place he left in 1714, when, by his own account, he was an absolute pedant; in this character he went abroad, where a familiarity with good company soon convinced him he was totally mistaken in almost all his notions; and an attentive study of the air, manner, and address of the people of fashion, soon polished a man whose predominant desire was to please; and who, as it afterwards appeared, valued exterior accomplishments beyond any other human acquirement. While lord Stanhope, he got an early seat in parliament; and in 1722 succeeded to his father's estate and titles. In 1728, and in 1745, he was appointed ambassador extraordinary and plenipotentiary to Holland; which high character he supported with the greatest dignity; serving his own country, and gaining the esteem of the states general. Upon his return from Holland, he was sent lord lieutenant of Ireland; and, during his administration there, gave general satisfaction to all parties. He left Dublin in 1746, and in October succeeded the earl of Harrington as secretary of

state, in which post he officiated until February 6th, 1748. Being seized with a deafness in 1752 that incapacitated him for the pleasures of society, he from that time led a private and retired life, amusing himself with books and his pen; in particular, he engaged largely as a volunteer in a periodical miscellaneous paper called *The World*, in which his contributions have a distinguished degree of excellence. He died in 1773, leaving a character for wit and abilities that had few equals. He distinguished himself by his eloquence in parliament on many important occasions. He was an active promoter of the bill for altering the style; on which occasion, as he writes in one of his letters to his son, he made so eloquent a speech in the house that every one was pleased. Lord Macclesfield, one of the greatest mathematicians in Europe, and who had a principal hand in framing the bill, spoke afterwards, with all the clearness that a thorough knowledge of the subject could dictate; but, not having a flow of words equal to lord Chesterfield, the latter gained the applause from the former. The high character lord Chesterfield supported during life received no small injury soon after his death, from a fuller display of it by his own hand. He left no issue by his lady, but had a natural son, Philip Stanhope, esq., whose education was for many years a close object of his attention, and who was afterwards envoy extraordinary at the court of Dresden, but died before him. When lord Chesterfield died, Mr. Stanhope's widow published a course of letters written by the father to the son, filled with instructions suitable to the different gradations of the young man's life to whom they were addressed. These letters contain many fine observations on mankind, and rules of conduct; but it is observable that he lays a greater stress on exterior accomplishments and address than on intellectual qualifications and sincerity; and allows greater latitude to fashionable pleasures than good morals will justify, especially in paternal instructions. Hence the celebrated Dr. Samuel Johnson observed of these letters, that they inculcate only the morals of a loose woman, with the manners of a dancing master.

STANHOPE (Charles), the third earl of Stanhope, was born August 3d, 1753. He received his education at Eton, and Geneva, where his genius led him to pay a close attention to the mathematics; and such was his progress that he obtained a prize from the society of Stockholm for a memoir on the pendulum. In 1774 he stood candidate for Westminster without success; but was introduced by the earl of Shelburne into parliament as member for the borough of Wycombe, which he represented until 1786, when the death of his father called him to the house of Peers. He regarded with pleasure the dawn of the French Revolution; openly avowed republican sentiments, and went so far as to lay aside the external ornaments of the peerage. He was also a frequent speaker against the war. As a man of science he ranked high both as an inventor and patron; and among other things was the author of a method for securing buildings from fire, an arithmetical machine, a new printing-press, a monochord for tuning musical instru-

ments, and a vessel to sail against wind and tide. He was twice married, first to lady Hester Pitt, daughter of the first earl of Chatham, by whom he had three daughters; and secondly to Miss Grenville, by whom he had three sons. This scientific but eccentric nobleman published several philosophical and a few political tracts. He died 14th of December 1816.

STANISLAUS (Leczinski), king of Poland, was born at Leopold the 20th of October, 1677. His father was a Polish nobleman, distinguished by his rank and the important offices which he held, but still more by his firmness and courage. Stanislaus was sent ambassador in 1704, by the assembly of Warsaw, to Charles XII. of Sweden, who had conquered Poland. He was at that time twenty-seven years old, was general of Great Poland, and had been ambassador extraordinary to the grand seignor in 1699. Charles was so delighted with the frankness and sincerity of his deportment, and with the firmness and sweetness which appeared in his countenance, that he gave him the crown of Poland, and ordered him to be crowned at Warsaw in 1705. He accompanied Charles XII. into Saxony, where a treaty was concluded with king Augustus in 1705, by which that prince resigned the crown, and acknowledged Stanislaus king of Poland. See POLAND. The new monarch remained in Saxony with Charles till 1707, when they returned into Poland and attacked the Russians, whom they obliged to evacuate that kingdom in 1708. But Charles, being defeated by Peter the Great in 1709, Augustus returned into Poland, and, being assisted by a Russian army, obliged Stanislaus to retire first into Sweden, and afterwards into Turkey. Soon after he took up his residence at Weissenburg in Alsace. Augustus despatched Sum his envoy to France, to complain of this; but the duke of Orleans, then regent, returned this answer:—'Tell your king, that France has always been the asylum of unhappy princes.' Stanislaus lived in obscurity till 1725, when Louis XV. espoused the princess Mary his daughter. Upon the death of Augustus, in 1733, he returned to Poland in hopes of remounting the throne. A large party declared for him; but his competitor, the young elector of Saxony, being supported by the emperor Charles VI. and the empress of Russia, was chosen king, though the majority was against him. Dantzic, to which Stanislaus had retired, was quickly taken, and the unfortunate prince made his escape in disguise with great difficulty, after hearing that a price was set upon his head by the Russians. When peace was concluded in 1736 between the emperor and France, it was agreed that Stanislaus should abdicate the throne, but that he should be acknowledged king of Poland and grand duke of Lithuania, and continue to bear these titles during life; that all his effects and those of the queen his spouse should be restored; that an amnesty should be declared in Poland for all that was past, and that every person should be restored to his possessions, rights, and privileges; that the elector of Saxony should be acknowledged king of Poland by all the powers who acceded to the treaty; that Stanislaus should be put in possession of the duchies

of Lorraine and Bar; but that immediately after his death these duchies should be united for ever to the crown of France. Stanislaus succeeded a race of princes in Lorraine who were beloved and regretted; and his subjects found their ancient sovereigns revived in him. He tasted then the pleasure which he had so long desired, the pleasure of making men happy. He assisted his new subjects; he embellished Nancy and Lunéville; he made useful establishments; he founded colleges and built hospitals. He was engaged in these noble employments, when an accident occasioned his death. His night-gown caught fire and burnt him so severely, before it could be extinguished, that he was seized with a fever, and died February 23d, 1766. His death occasioned a public mourning; the grief of his subjects was genuine. In his youth he had accustomed himself to fatigue, and had strengthened his mind and constitution. He was temperate, liberal, adored by his vassals, gentle, affable, compassionate, treating his subjects like equals, and alleviating their misfortunes. His revenues were small, but were we to judge of them by what he did, we might reckon him the richest potentate in Europe. He gave 18,000 crowns to the magistrates of Bar to be employed in purchasing grain, when at a low price, to be sold out again to the poor at a moderate rate, when the price should rise above a certain sum. He was a protector of the arts and sciences; he wrote several works of philosophy, politics, and morality, which were collected and published in France in 1765, in 4 vols. 8vo, under the title of *Oeuvres du Philosophe Bienfaisant*, 'the Works of the Benevolent Philosopher.'

STANISLAUS AUGUSTUS (Poniatowski), the last king of Poland, was the son of count Poniatowski, a Polish nobleman, by a lady of royal descent, and born in 1732. After receiving a very liberal education, he went abroad and resided for a considerable time in England; where he became intimate with Sir Charles Hanbury Williams, whom he accompanied in his embassy to Petersburg. Being uncommonly handsome, he soon attracted the attention of the grand duchess, afterwards Catharine II. To increase his importance, he was appointed ambassador from Augustus king of Poland, and invested with the insignia of the white eagle; but his intrigue with the grand duchess being discovered, the empress Elizabeth was so much offended that she expressed her displeasure to the king of Poland who immediately recalled him. Upon the immorality of this amour we need make no comment. Moral principles are seldom regarded by the great when they interfere with their pursuits of pleasure or of power. But it will be seen how she rewarded him. When Catharine ascended the throne, on the murder of her husband, Poniatowski, thinking he would be a welcome visitant, set out for Petersburg; but, to his surprise and mortification, he received a message from his old mistress, when on the frontiers, advising him to return to Warsaw. However, on the death of king Augustus, in 1763, Catharine announced her intention of placing her favorite on the throne of Poland; a measure which, though disagreeable to many of the Polish nobles, she

effected in 1764. See POLAND. The disturbances which soon after commenced between the Roman Catholics and the Dissidents; the interference of Russia and the other partitioning powers; the seizure of the king's person by conspirators, with his astonishing escape; the beautiful but short lived revolution, and new constitution; the first and second partitions of Poland by the surrounding powers; with the bloody operations of the Russians under Suwarow, the massacre of Prague, and the capture of Warsaw, are fully recorded under POLAND. The unfortunate monarch was obliged to resign his crown in November 1795, and retire to Petersburg; where he died April 11th, 1798. He was one of the most accomplished men of his age; had read the best authors ancient and modern; and could converse in various languages. Under the last constitution he would have made an excellent monarch, and a happy people, if the other powers of Europe had assisted him and the brave Poles against their oppressors.

STANISLAWOW, a circle of Austrian Galicia, situated in the south-east of the province, adjacent to Hungary and the circles of Stryi and Tarnopol. It has a territorial extent of 1955 square miles.

STANISLAWOW, a trading town of Austrian Poland, the capital of the preceding circle. It is surrounded by a wall, and is well fortified, has a Catholic and an Arminian church, a gymnasium, and a central school. It has also a government depot of tobacco and snuff. Inhabitants 6200. Eighty miles south by east of Lemberg, and 172 north-west of Jassy.

STANK, *adj.* Ital. *stanco*. Weak; worn out. Obsolete.

Diggon, I am so stiff and so stank,
That unneeth I may stand any more,
And how the western wind bloweth sore,
Beating the withered leaf from the tree. *Spenser.*

STANLEY (Sir Thomas), knt., of Cumberlow Green, in Herefordshire, a learned writer of the seventeenth century, who published two volumes of Poems; the one in 1649, and the other in 1651.

STANLEY (Thomas), son of Sir Thomas, became still more famous for his learning. He was born at Cumberlow about 1644, and educated in his father's house, whence he removed to the university of Cambridge. He afterwards travelled through France, Italy, and Spain, and, upon his return to England, prosecuted his studies in the Middle Temple. He married Dorothy, the eldest daughter of Sir James Engan of Flower in Northamptonshire. He wrote, 1. A Volume of Poems. 2. A Translation of Ælian's Various History. 3. History of Philosophy and Lives of the Philosophers. 4. A Translation of Æschylus, with a Commentary; and several other works. He died in 1678.

STANLEY (John), an eminent composer and performer of music, born in 1713. He was blind from his infancy, but acquired so profound a knowledge of music that he became master of his majesty's band of musicians, and organist to the society of the temple and of St. Andrew's, Holborn. He died in 1786.

STANNARY, *adj.* Lat. *stannum*. Relating to the tin-works.

A steward keepeth his court once every three weeks: they are termed *stannary* courts, of the Latin *stannum*, and hold plea of action of debt or trespass about white or black tin. *Carew*.

STANNARY is also used for the mines and works wherein tin is dug and purified; as in Cornwall, Devonshire, &c. See CORNWALL and TIN.

STANNARY COURTS, in Devonshire and Cornwall, courts held for the administration of justice among the tanners therein. They are held before the lord warden and his substitutes, in virtue of a privilege granted to the workers in the tin mines there, to sue and be sued only in their own courts, that they may not be drawn from their business, which is highly profitable to the public, by attending their law suits in other courts. The privileges of the tanners are confirmed by a charter 33 Edw. I., and fully expounded by a private statute, 50 Edw. III., which has since been explained by a public act, 16 Car. I. c. 15. What relates to our present purpose is only this: that all tanners and laborers in and about the stannaries shall, during the time of their working therein, bona fide, be privileged from suits of other courts, and be only pleaded in the stannary court in all matters, excepting pleas of land, life, and member. No writ of error lies hence to any court in Westminster-hall; as was agreed by all the judges, in 4 Jac. I. But an appeal lies from the steward of the court to the under warden; and from him to the lord warden; and thence to the privy council of the prince of Wales, as duke of Cornwall, when he has had livery or investiture of the same. And thence the appeal lies to the king himself, in the last resort.

STANNI PULVIS. Tin finely divided is exhibited internally as a vermifuge. It acts mechanically, and the fine filings are more effectual than the powder.

STANOVOY, a chain of mountains in Asiatic Russia, forming part of the great northern chain which here crosses the breadth of the continent. It receives this name after turning to the north, near the source of the Aldane, whence it runs parallel to the gulf of Okhotsk, leaving only a narrow plain intervening. It opposes serious difficulty to travellers proceeding to this extremity of the Russian empire, and is supposed to continue uninterrupted, though with some diminution of magnitude, to Cape Tchoutchi, at the north-eastern extremity of Asia; the Aleutian and Fox Isles may probably be considered in some degree as a continuation of it. An important and lofty branch passes into Kamschatka and the Kurile Islands. This chain consists chiefly of granite and porphyry, though there are whole mountains composed of green jasper.

STANYHURST (Richard), an Irish historian, poet, and divine, born at Dublin about 1545, and educated at University College, Oxford. He afterwards studied the law at Furnival's and Lincoln's Inns; but, turning Roman Catholic, he went to the Continent, where he entered into orders; and at Brussels was made chaplain to Albert, archduke of Austria, then governor of

the Spanish Netherlands. He published several learned works; particularly, 1. *Harmonia, seu catena dialectica in Porphyrium*; folio 1570. 2. *De Rebus in Hibernia gestis*; 4to. 1584. 3. *De Vita S. Patricii*; 12mo. 1587. 4. The first four books of Virgil's *Æneid*, in English hexameters; 12mo. 1583. He died in 1613.

STANZA, *n. s.* Ital. *stanza*; Fr. *stanche*. A number of lines regularly adjusted to each other; so much of a poem as contains every variation of measure or relation of rhyme. Stanza is originally a room of a house, and came to signify a subdivision of a poem; a staff.

So bold as yet no verse of mine has been,

To wear that gem on any line;

Nor, till the happy nuptial hour be seen,

Shall any stanza with it shine.

Cowley.

Horace confines himself strictly to one sort of verse or stanza in every ode.

Dryden.

Before his sacred name flies every fault,
And each exalted stanza teems with thought. *Pope.*

STAPELIA, a genus of plants belonging to the class pentandria, and the order digynia. The generic characters are these: CAL. monophyllous, quinquefid, acute, small, and permanent: COR. monopetalous, flat, large, and divided, deeper than the middle, into five parts, with broad, flat pointed lacinia. The nectarium is small, star-shaped, flat, quinquefid, with linear lacinia; and embracing with its ragged points the seed-forming parts. Another small star, which is also flat and quinquefid, covers the seminiferous parts with its entire acute lacinia. The stamina are five in number; the filaments are erect, flat, and broad; and the antheræ are linear, on each side united to the side of the filament. The pistillum has two germina, which are oval and flat on the inside. There are no styles; and the stigmata are obsolete. The seed-vessel consists of two oblong, awl-shaped, unilocular and univalved follicles. The seeds are numerous, imbricated, compressed, and crowned with a pappus or down. This singular tribe of plants is peculiar to the sandy deserts of Africa and Arabia. They are extremely succulent. From this peculiarity of structure, the power of retaining water to support and nourish them, they are enabled to live during the prevalent droughts of those arid regions. On this account the stapelia has been denominated the camel of the vegetable kingdom. The peculiar economy in the stapelia and other succulent plants seems to exist in the absorbent and exhalant systems. The power of absorption is as much increased as the power of the exhalant or perspiratory vessels is diminished. In these plants a small quantity of nourishment is required. There is no solid part to be formed, no large fruit to be produced. They generally have very small leaves, often are entirely naked; so that, taking the whole plant, a small surface only is exposed to the action of light and heat, and consequently a much smaller proportion of water is decomposed than in plants which are much branched and furnished with leaves. Two species of stapelia only were known at the beginning of the eighteenth century. The unfortunate Forskal, the companion of Niebur, who was sent out by the king of Denmark to explore the interior of Arabia, and who fell a

sacrifice to the pestilential diseases of those inhospitable regions, discovered two new species. Thunberg, in his Prodomus, has mentioned five more. Forty new species have been discovered by Mr. Masson of New Gardens, who was sent out by his majesty George III. for the purpose of collecting plants round the Cape of Good Hope. Descriptions of these, with elegant and highly finished colored engravings, have lately been published. They are chiefly natives of the extensive deserts called Karro, on the western side of the Cape.

STAPES OF THE EAR. See **ANATOMY**, **INDEX**, and **SOUND**.

STAPHIS, Gr. *σταφίς*, strictly a grape, or a bunch of grapes; whence, from their likeness thereunto, it is applied to many other things, especially the glands of the body, whether natural or diseased.

STAPHISAGRIA, Gr. *σταφίς αγρία*, wild vine; from its resemblance of its leaves to those of the vine.

STAPHYLÆA, bladder-nut, in botany, a genus of plants belonging to the class of pentandria and order of trigynia; natural order twenty-third, trihilatæ: **CAL.** quinquepartite. There are five petals. The capsules are three, inflated and joined together by a longitudinal suture. The seeds are two, and are globose with a scar. There are two species, the pinnata and trifolia.

1. *S. pinnata*, or bladder-nut-tree, is a tall tree. The leaves are pinnated; the pinnæ are generally five, oblong, pointed, and notched round the edges. The flowers are white, and grow in whirls on long pendulous foot-stalks. This plant flowers in June, and is frequent in hedges about Pontefract and in Kent.

2. *S. trifolia*, or three-leaved bladder-nut, is a native of Virginia.

STAPHYLE, Gr. *σταφύλη*, a grape or raisin: so called from its resemblance. The uvula.

STAPHYLINUS, a genus of animals belonging to the class of insectæ, and order of coleoptera. The antennæ are moniliform; the feelers four in number; the elytra are not above half the length of the abdomen; the wings are folded up and concealed under the elytra; the tail or extremity of the abdomen is single, is provided with two long vesicles which the insect can shoot out or draw back at pleasure. Gmelin enumerates 117 species, of which five only are natives of Great Britain, viz.

1. *S. chrysomelinus* is black; the thorax, elytra, and feet, being testaceous. It is found in the north of Europe.

2. *S. maxillosus* is black, with ash-colored stripes, and jaws as long as the head. It inhabits the woods.

3. *S. murinus*. The head is depressed. The color is gray, clouded with black. The length is six lines. It lives among horse dung.

4. *S. riparius* is of a reddish-brown color; but the elytra are azure-colored; and the head, antennæ, and two last rings of the abdomen, are black. It is frequent on the banks of rivers in Europe.

5. *S. rufus* is of an orange-color; but the posterior part of the elytra and abdomen is black,

as are also the thighs at their base. These insects have a peculiarity to be met with in almost every species of this genus, which is, that they frequently turn up their tail, or extremity of the abdomen, especially if you chance to touch them; in which case the tail is seen to rise immediately, as if the insect meant to defend itself by stinging. Yet that is not the place where the insect's offensive weapons are situated. Its tail has no sting, but it bites and pinches strongly with its jaws; and care must be taken, especially in laying hold of the larger species. Their jaws are strong, shoot out beyond the head, and are subservient to the animal in seizing and destroying its prey. They feed on all other insects they can catch; even frequently two staphylini of the same species bite and tear each other. Though this insect has very small elytra, yet its wings are large; but they are curiously folded up, and concealed under the elytra. The insect unfolds and expands them when he chooses to fly, which he does very lightly. Among the small species of this genus, there are several whose colors are lively and singularly intermingled. Some of them are found upon flowers, but they chiefly inhabit the dung of cows. Their larvæ, which resemble them so much as to be scarcely distinguishable, live in damp places under ground. They are by some called Kove beetles.

STAPHYLOMA. See **SURGERY**.

STAPLE, *n. s.* & *adj.* Fr. *estape*; Belg. *stapel*, perhaps from Lat. *stabilis*. A settled mart; an established emporium; the original material of a manufacture: settled, established in commerce.

At Leicester, for her wool whose *staple* doth excel,
And seems to overmatch the golden Phrygian fell.

Drayton.

Some English wool, vexed in a Belgian loom,
And into cloth of spongy softness made,
Did into France or colder Denmark roam,
To ruin with worse ware our *staple* trade. *Dryden.*

A *staple* of romance and lyes,
False tears, and real perjuries. *Prior.*

The customs of Alexandria were very great, it having been the *staple* of the Indian trade.

Arbutnot on Coins.

What needy writers would not solicit to work under such masters, who will take off their ware at their own rates, and trouble not themselves to examine whether it be *staple* or no? *Swift.*

STAPLE, *n. s.* Sax. *ƿeapul*, a prop. A loop of iron; a bar bent and driven in at both ends.

I have seen *staples* of doors and nails born. *Peacham.*

The silver ring she pulled, the door reclosed:
The bolt, obedient to the silken cord,
To the strong *staple's* inmost depth restored,
Secured the valves. *Pope's Odyssey.*

STAPLE signifies a public market, whither merchants, &c., are obliged to bring their goods for sale; as the Greve, or the places along the Seine, for sale of wines and corn at Paris, whither the merchants of other parts are obliged to bring those commodities. Formerly the merchants of England were obliged to carry their wool, cloth, lead, and other staple commodities of this realm, to expose them by wholesale; and these staples were appointed to be constantly kept at York, Lincoln, Newcastle-upon-Tyne, Norwich, Westminster, Canterbury,

Chichester, Winchester, Exeter, and Bristol; in each of which a public mart was appointed to be kept, and each of them had a court of the mayor of the staple, for deciding differences, held according to the law merchant, in a summary way.

STAPLE COMMODITIES, such wares and merchandises as are commonly and readily sold in a market, or exported abroad; being for the most part the proper produce or manufacture of the country.

STAPLETON (Thomas), a celebrated Roman Catholic divine, born in Sussex in 1535. He was educated at Canterbury and Winchester, and then sent to New College, Oxford, where he became a fellow. On the accession of queen Elizabeth he went to Louvain, where he was appointed regius professor in divinity, canon of St. Peter's, and dean of Hillerbeck. He died in 1598. His works were published at Paris in 1620, in 4 vols. folio.

STAPYLTON (Sir Robert), the third son of Richard Stapylton, of Carleton, Yorkshire, was born in Yorkshire, and educated in the Roman faith, in the college of English Benedictines, at Douay, in France. On his return to England he turned Protestant, and was appointed gentleman usher to the prince of Wales, afterwards Charles II. When king Charles I. was obliged to fly from London, he went with him, and was knighted in 1642. After the battle of Edgehill he attended the king to Oxford, and was created LL. D. During the Commonwealth, and Cromwell's usurpation, he spent his time in retirement and study; but, after the Restoration, he was promoted to some offices by Charles II. He published several dramatic works, and died in 1669.

STAR, *n. s.*
STAR'GAZER,
STAR'LESS, *adj.*
STAR'LIGHT, *n. s. & adj.*
STAR'LIKE, *adj.*
STAR'PAVED,
STAR'PROOF,
STAR'RED,
STAR'RY,
STAR'SHOOT, *n. s.*

Saxon *ſtær*; Belg.
 Teut. *sterre*; Belg.
star; Latin *astrum*;
 Gr. *αστρον*. One
 of the luminous bod-
 ies that appear in
 the nocturnal sky;
 particular configura-
 tions of the stars;
 the pole star; a

mark of reference: a stargazer is a familiar name of an astrologer or astronomer: starless, devoid of stars; dark: starlight, the lustre of, or lighted by the stars: starlike, stellated; resembling the stars in lustre: starpaved, studded with stars: starproof, impervious to starlight: starred, influenced by or decorated with stars. starry, abounding with stars: starshoot is an emission from a star.

Let the astrologers, the *stargazers*, and the monthly prognosticators, stand up and save thee.

Isa. xlvii. 13.

Such is his will, that paints
 The earth with colors fresh,
 The darkest skies with store
 Of *starry* lights.

Spenser.

Then let the pebbles on the hungry beech,
 Fillop the *stars*;

Murdering impossibility, to make

What cannot be, sigh twok. *Shakspeare. Coriolanus.*

Well, if you be not turned Turk, there is no more
 sailing by the *star*. *Id. Much Ado About Nothing.*

From forth the fatal loins of these two foes
 A pair of *star-cross* lovers take their life. *Shakspeare.*

My third comfort

Starred most unluckily, is from my breast

Hal'd out to murder.

Id. Winter's Tale.

Now they never meet in grove or green,

By fountain clear or spangled *starlight* sheen.

Shakspeare.

Tears had dimmed the lustre of her *starry* eyes.

Id. Illust.

Hither the Syracusan's art translates
 Heaven's form, the course of things, and human
 fates;

The included spirit, serving the *star-decked* signs,
 The living work in constant motions winds,

Hakewill.

Such his fell glances as the fatal light
 Of *starring* comets that look kingdoms dead.

Crashaw.

As from a cloud his fulgent head,
 And shape *star* bright, appeared.

Milton.

In progress through the road of heaven *starpaved*.

Id.

Under the shady roof

Of branching elm *starproof*.

Id.

That *starred* Ethiop queen, that strove

To set her beauty's praise above

The sea-nymphs.

Id.

A boundless continent,

Dark, waste, and wild, under the frown of night

Starless exposed.

Id. Paradise Lost.

Nor walk by moon,

Or glittering *starlight*, without thee is sweet. *Milton.*

The having turned many to righteousness shall con-
 fer a *starlike* and immortal brightness.

Boyle's Seraphick Love.

I have seen a good quantity of that jelly, by the
 vulgar called a *starshoot*, as if it remained upon the
 extinction of a falling star.

Boyle.

These reasons moved her *starlike* husband's heart;
 But still he held his purpose to depart.

Dryden.

Heaven and earth's compacted name,

And flowing waters, and the *starry* flame,

And both the radiant lights, one common soul

Inspires and feeds, and animates the whole. *Id.*

Cato might give them furlos for another world;

But we, like sentries, are obliged to stand

In *starless* nights, and wait the appointed hour. *Id.*

They danced by *starlight* and the friendly moon.

Id.

Owls, that mark the setting sun, declare

A *starlight* evening and a morning fair. *Id. Virgil.*

We are apt to do amiss, and lay the blame upon
 our *stars* or fortune.

L'Estrange.

A *stargazer*, in the height of his celestial observa-
 tions, stumbled into a ditch. *Id.*

Nightshade tree rises with a wooden stem, green-
 leaved, and has *starlike* flowers.

Mortimer's Husbandry.

He furious hurled against the ground

His sceptre *starred* with golden studs around. *Pope.*

Daphne wondering mounts on high,

Above the clouds, above the *starry* sky! *Id.*

Remarks worthy of riper observation, note with a
 marginal *star*.

Watts.

When an astronomer uses the word *star* in its
 strict sense, it is applied only to the *fix stars*: but in
 a large sense it includes the planets. *Id.*

STAR, in astronomy, is a general name for all
 the heavenly bodies, which, like so many bril-
 liant studs, are dispersed throughout the whole
 heavens. The stars are distinguished from the
 phenomena of their motion &c., into fixed, and
 erratic or wandering stars; these last are again

distinguished into the greater luminaries, viz. the sun and moon; the planets, or wandering stars, properly so called; and the comets. See *ASTRONOMY*. As to the fixed stars, they are so called, because they seem to be fixed, or perfectly at rest, and consequently appear always at the same distance from each other.

STAR is also a badge of honor, worn by the knights of the garter, bath, and thistle. See *GARTER*.

STAR, in fortification, denotes a small fort, having five or more points, or salient and re-entering angles, flanking one another, and their faces ninety or 100 feet long.

STARAJA RUSSA, a town of European Russia, in the government of Novgorod, on the river Polista, not far from the lake Ilmen. It has a considerable trade in hemp and flax; but the most important establishment is a salt work belonging to the government. Inhabitants 5300. Thirty-four miles south of Novgorod and 137 south by east of Petersburg.

The *STAR APPLE* is a species of chrysophyllum.

STAR HYACINTH, a species of scilla.

STAR OF ALEXANDRIA, a species of ornithogalum.

STAR OF BETHLEHEM. See *ORNITHOGALUM*.

STAR OF CONSTANTINOPLE, *STAR OF NAPLES*, other two species of ornithogalum.

STARS, FALLING. See *IGNIS FATUUS*, *METEOR*, and *METEOROLOGY*.

STAR THISTLE, in botany. See *CENTAUREA*.

STARBOARD, *n. s.* Sax. *ƿreorþord*. Is the right hand side of the ship, as larboard is the left. Sax. *ƿreoƿ*, signifies high, particularly in authority, and would be applied to those officers who had a right to walk on the right side of the ship.

On shipboard the mariners will not leave their *starboard* and *larboard*, because some one accounts it gibbish. *Bramhall*.

STARBOARD is the right side of the ship when the eye of the spectator is directed forward.

STAR'CH, *n. s. & v. a.* } Teut. *starc*. A vis-

STARCHED, *adj.* } cous matter used in stiffening linen: to apply starch: stiffened with starch; stiff.

Has he
Disliked your yellow *starch*, or said your doublet
Was not exactly Frenchified?

Fletcher's Queen of Cor.
With *starch* thin laid on, and the skin well stretched, prepare your ground.

Peacham on Drawing.
Her goodly countenance I've seen
Set off with kerchief *starched* and pinnars clean.

Gay.
Does the Gospel any where prescribe a *starched*
squeezed countenance, a stiff formal gait, or a singu-
larity of manners? *Swift.*

STARCH is a fecula or sediment found at the bottom of vessels wherein wheat has been steeped in water; of which fecula, after separating the bran from it by passing it through sieves, they form a kind of loaves, which, being dried in the sun or an oven, are afterwards cut into little pieces, and so sold. The best starch is white, soft, and friable, and easily broken into powder.

Such as require fine starch do not content themselves, like the starchmen, with refuse wheat, but use the finest grain. The process is as follows:—The grain, being well cleaned, is put to ferment in vessels full of water, which they expose to the sun while in its greatest heat; changing the water twice a day, for the space of eight or twelve days according to the season. When the grain bursts easily under the finger, they judge it sufficiently fermented. The fermentation perfected, and the grain thus softened, it is put, handful by handful, into a canvas bag, to separate the flour from the husks; which is done by rubbing and beating it on a plank laid across the mouth of an empty vessel that is to receive the flour. As the vessels are filled with this liquid flour, there is seen swimming at top a reddish water, which is to be carefully scummed off from time to time, and clean water is to be put in its place, which, after stirring the whole together, is also to be strained through a cloth or sieve, and what is left behind put into the vessel with new water, and exposed to the sun for some time. As the sediment thickens at the bottom, they drain off the water four or five times, by inclining the vessel, but without passing it through the sieve. What remains at bottom is the starch, which they cut in pieces to get out, and leave it to dry in the sun. When dry it is laid up for use.

STARCH is commonly made of wheat, and the very best starch can perhaps be made of nothing else. Wheat, however, is too valuable an article of food to be employed as the material of starch, if any thing else will answer the purpose; and it has long been known that an inferior kind of starch may be made of potatoes. Potatoes, however, are themselves a valuable article of food; and it is therefore an object of importance to try if starch may not be made of something still less useful. On the 8th of March, 1796, a patent was granted to lord William Murray for his discovery of a method by which starch may be extracted from horse chestnuts. But the description of the method is too tedious for our admitting it.

Chemically starch may be described as a white, insipid, combustible substance, insoluble in cold water, but forming a jelly with boiling water. It exists chiefly in the white and brittle parts of vegetables, particularly in tuberos roots, and the seeds of graminaceous plants. It may be extracted by pounding these parts, and agitating them in cold water; when the parenchyma, or fibrous parts, will first subside; and, these being removed, a fine white powder, diffused through the water, will gradually subside, which is the starch. Or the pounded or grated substance, as the roots of arum, potatoes, acorns, or horse chestnuts, for instance, may be put into a hair-sieve, and the starch washed through with cold water, leaving the grosser matters behind. Farinaceous seeds may be ground and treated in a similar manner. Oily seeds require to have the oil expressed from them before the farina is extracted. If starch be subjected to distillation, it gives out water impregnated with empyreumatic acetous acid, a little red or brown oil, a

great deal of carbonic acid, and carburetted hydrogen gas. Its coal is bulky, easily burned, and leaves a very small quantity of potash and phosphate of lime. If when diffused in water it be exposed to a heat of 60° Fahrenheit, or upward, it will ferment and turn sour; but much more so, if it be not freed from the gluten, extract, and coloring matter. Thus, in starch-making, the farina ferments and becomes sour, but the starch that does not undergo fermentation is rendered the more pure by this process. Some water, already soured, is mixed with the flour and water, which regulates the fermentation, and prevents the mixture from becoming putrid; and in this state it is left about ten days in summer, and fifteen in winter, before the scum is removed, and the water poured off. The starch is then washed out from the bran, and dried, first in the open air, and finally in an oven.

With boiling water starch forms a nearly transparent mucilage, emitting a peculiar smell, neither disagreeable nor very powerful. This mucilage may be dried, and will then be semitransparent and much resembling gum, all the products of which it affords. When dissolved it is much more easily digested and nutritious than before it has undergone this operation. Both acids and alkalis combined with water dissolve it. It separates the oxides of several metals from their solutions, and takes oxygen from many of them. It is found naturally combined with all the immediate principles of vegetables, and may easily be united with most of them by art. When starch is triturated with iodine, it forms combinations of various colors. When the proportion of iodine is small, these compounds are violet; when somewhat greater, blue; and when still greater, black.

We can always obtain the finest blue color, by treating starch with an excess of iodine, dissolving the compound in liquid potash, and precipitating by a vegetable acid. The color is manifested even at the instant of pouring water of iodine into a liquid which contains starch diffused through it. Hence iodine becomes an excellent test for detecting starch; and starch for detecting iodine. Besides these combinations, it appears that there is another of a white color, in which the iodine exists in very small quantity. All of them possess peculiar properties, which have been described by MM. Colin and Gauthier Claubry (*Annal. de Chimie*, xc. 92), and M. Pelletier (*Bulletin de Pharmacie*, vi. 289).

Starch is not affected in the cold, by water, alcohol, or ether. But it dissolves readily when triturated with potash water. When to the solution of starch in hot water, we pour in a boiling hot solution of sub-nitrate of lead, and leave the mixture for a considerable time at rest, a precipitate falls, which is found after washing and drying to consist of 100 starch and 38.89 protoxide of lead.—Berzelius, *Ann. de Chimie*, xc. 82. Starch is convertible into sugar by dilute sulphuric acid. To produce this change we must take 2000 parts of starch, diffuse them in 8000 parts of water, containing forty parts of strong oil of vitriol; and boil the mixture for thirty-six hours in a basin of silver or lead, taking care to stir the

materials with a wooden rod during the first hour of ebullition. At the end of this time the mass having become liquid, does not require to be stirred, except at intervals. In proportion as the water evaporates, it ought to be replaced. When the liquor has been sufficiently boiled, we must add to it chalk and animal charcoal; then clarify with white of egg, filter the mixture through a flock of wool, and then concentrate the liquid till it has acquired a syrupy consistence. After this the basin must be removed from the fire, in order that, by cooling, the greater part of the sulphate of lime may fall down. The pure syrup is now to be decanted off, and evaporated to the proper dryness. The greater the quantity of acid employed, the less ebullition is required to convert the starch into the saccharine matter.—Vogel, *Ann. de Chimie*, lxxii. 148.

The discovery of the preceding process is due to M. Kirchoff of St. Petersburg. M. Th. de Saussure has ascertained that no gas is given off during the operation; that the access of air is not essential to it; that the sulphuric acid is not decomposed; and that 100 parts of starch produce 110.14 of sugar.

The presence of sulphuric acid is not indispensable for obtaining sugar from starch. It may also be obtained by leaving the starch to itself, either with or without contact of air, or by mixing it with dried gluten. At the same time, indeed, several other products are formed. M. Th. de Saussure's interesting observations on this subject are published in the *Annales de Chimie et de Physique*, xi. 379. The starch, brought to the state of a pulpy mass, must be left to spontaneous decomposition. The products are, 1st, a sugar, like the sugar of grapes; 2d, gum, like that from roasted starch; 3d, amidine, a body whose properties are intermediate between those of starch and gum; and, 4th, an insoluble substance like ligneous matter. In these experiments, the mass on which he operated was made by pouring twelve parts of boiling water on one of starch. When it was fermented by dry gluten, he obtained—

	Without contact of air.	With contact of air.
Sugar	47.4	49.7
Gum	23.0	9.7
Amidine	8.9	5.2
Amilaceous lignin	10.3	9.2
Lignin with charcoal, A trace		0.3
Undecomposed starch	4.0	3.8

Potatoe starch differs perceptibly from that of wheat; it is more friable; is composed of ovoid grains about twice the size of the other; it requires a lower temperature to reduce it into a jelly with water; it is soluble in more dilute alkaline leys, and is less readily decomposed by spontaneous fermentation. It also contains more hygrometric water; for 100 parts of it dried at the temperature of boiling water lost 16.41 parts of water; whilst wheat starch lost by the same process only 13.66. They had both been previously exposed for some time to a dry atmosphere, at the heat of 72.5° Fahrenheit. Starch is composed of—

Gay Lussac & Thenard.	Berzelius.	Saussure.
Carbon . 43.55	43.481	45.39
Oxygen . 49.68	49.455	48.31
Hydrogen 6.77	7.064	5.90
100.00	100.000	99.60
	Azote . 0.4	
		100.00

When starch is roasted at a moderate heat in an oven, it is converted into a species of gum, employed by the calico printers. Potatoe starch answers best for this purpose.

M. Caventou considers starch paste made with hot water as containing the same thing as the amidine of M. de Saussure. Salop, according to him, is composed of a little gum, very little starch, and much bassorine. Sago is a uniform substance, soluble in cold water, more so in hot, precipitated blue by iodine, and differing from common starch in the first property. Tapioca seems to be identical in composition with sago. Arrow-root is nearly pure starch, agreeing in all respects with the starch of the potatoe, which may be converted by heat into something similar to sago and tapioca.—*Annales de Chimie et Physique*, xxxi. 337.

Starch is the principal alimentary substance contained in our bread. In a medical point of view it is to be considered as a demulcent; and accordingly, it forms the principal ingredient of an official lozenge in catarrhs, and a mucilage prepared from it often produces excellent effects, both taken by the mouth and in the form of clyster, in dysenteries and diarrhœa, from irritation of the intestines. Milk and starch, with the addition of suet finely sbred, and incorporated by boiling, was the soup employed by Sir John Pringle in dysenteries, where the mucous membrane of the intestines had been abraded. Externally, surgeons apply it as an absorbent in erysipelas.

STAR CHAMBER, COURT OF, (*camera stellata*), a famous, or rather infamous, English tribunal, said to have been so called either from a Saxon word signifying to steer or govern; or from its punishing the crimen stellionatus, or cosenage; or because the room wherein it sat, the old council-chamber of the palace of Westminster (Lamb. 148) which was afterwards converted into the lottery-office, and forms the east side of New Palace Yard, was full of windows; or (to which Sir Edward Coke, 4 Inst. 66, accedes), because haply the roof thereof was at the first garnished with gilded stars. All these are merely conjectures (for no stars are now in the roof, nor are any said to have remained there so late as the reign of queen Elizabeth); and another conjectural etymology, as far-fetched as any of them, has been derived from *starra* or *starrs*, a corruption of the Hebrew word *shetar*, a covenant; which Jewish covenants, it is alleged, were lodged in this chamber by Richard I. before the Jews were banished. (See Tovey's *Angl. Judaic*, 32. Selden. Tit. of Hon. ii. 34. Uxor *Ebraic*. i. 14.) But, whatever was the origin of the name, this court was of very ancient original; but new-modelled by stats. 3 Hen. VII. c. 1, and 21 Hen. VIII. c. 20, consisting of divers lords spiritual

and temporal, being privy-counsellors, together with two judges of the courts of common-law, without the intervention of any jury. Their jurisdiction extended legally over riots, perjury, misbehaviour of sheriffs, and other notorious misdemeanors, contrary to the laws of the land. 'Yet this was afterwards,' says lord Clarendon, 'stretched to the asserting of all proclamations and orders of state; to the vindicating of illegal commissions and grants of monopolies; holding for honorable that which pleased, and for just that which profited; and becoming both a court of law to determine civil rights, and a court of revenue to enrich the treasury; the council-table by proclamations enjoining to the people that which was not enjoined by the laws, and prohibiting that which was not prohibited; and the star-chamber, which consisted of the same persons in different rooms, censuring the breach and disobedience to those proclamations by very great fines, imprisonments, and corporal severities: so that any disrespect to any acts of state, or to the persons of statesmen, was in no time more penal, and the foundations of right never more in danger to be destroyed.' For which reasons it was finally abolished by stat. 16 Car. I. c. 10, to the general joy of the whole nation. See KING'S BENCH. There is in the British Museum (*Harl. MSS.* vol. I. No. 126) a very full account of the constitution and course of this court, compiled by William Hudson of Gray's Inn, an eminent practitioner therein. A short account of the same, with copies of all its process, may also be found in 18 Rym. Foed. 192, &c.

STARRE, *v. n.* } Sax. *stapan*; Belg. and
STARER, *n. s.* } Teut. *sterren*. To look with fixed eyes; expressing wonder, impudence, confidence, stupidity, or horror: to stare in the face is to be undeniable: a stare is a fixed look: starrer corresponds.

Their *staring* eyes sparkling with fervent fire,
And ugly shapes, did nigh the man dismay,
That, were it not for shame, he would retire.

Spenser.

Look not big, nor stare nor fret:
I will be master of what is mine own. *Shakspeare.*
They were never satisfied with *staring* upon their masts, sails, cables, ropes, and tacklings. *Abbot.*

I hear

The tread of many feet steering this way;
Perhaps my enemies, who come to stare
At my affliction, and perhaps to insult.

Milton's Agonistes.

A satyr, that comes *staring* from the woods,
Must not at first speak like an orator. *Waller.*

And, while he *stares* around with stupid eyes,
His brows with berries and his temples dyes. *Dryden.*

What dost thou make a shipboard?
Art thou of Bethlem's noble college free,
Stark *staring* mad, that thou shouldst tempt the sea?
Id.

Break out in crackling flames to shun thy snare,
Or hiss a dragon, or a tyger stare. *Id. Virgil.*

Why dost thou not
Try the virtue of that gorgon face,
To stare me into statue? *Dryden.*

Is it possible for people without scruple to offend against the law which they carry about them in indecipherable characters, and that *stares* them in the face whilst they are breaking it?
Locke.

Take off all the *staring* straws and jags in the hive, and make them smooth.

Mortimer's Husbandry.

The wit at his elbow gave him a touch upon the shoulder, and *stared* him in the face with so bewitching a grin that the whistler relaxed his fibres.

Addison.

She paid a tradesman once, to make him *stare*.

Pope.

One self-approving hour whole years outweighs Of stupid *sturers*, and of loud huzzas.

Id.

Through nature and through art she ranged,

And gracefully her subject changed :

In vain ; her hearers had no share

In all she spoke, except to *stare*.

Swift.

STARFISH, *n. s.* Star and fish. A fish branching out into several points. See ASTERIAS.

This has a ray of one species of English *starfish*.

Woodward.

STARGARD, an inland town of Pomerania, in a pleasant and fertile district on the river Ihna, which falls, at the distance of twenty miles, into the Oder. It is surrounded with a wall, has three small suburbs. It contains manufactures of woollens, soap, and tobacco ; also breweries and distilleries ; and exports the corn of the neighbouring country by the Ihna, which is navigable without interruption to the Oder, and the Baltic. Here are several schools for education on the usual plan : also one for teaching mechanical arts, on a more scientific plan than is generally done by masters to their workmen. Stargard suffered severely from war in the sixteenth and seventeenth centuries. In 1753 it was taken by the Russians. Inhabitants about 8600. Twenty-one miles east by south of Stettin.

STARGARD, a lordship of Germany, in the grand duchy of Mecklenburg-Strelitz, which forms a considerable part of that principality. Its superficial extent is 6350 square miles ; its population about 60,000. The chief town is Stargard or Old Stargard, a small place with 900 inhabitants. Five miles S. S. E. of New Brandenburg.

STAR-HAWK, or GOS-HAWK. See FALCO.

STARK, *adj. & adv.* } Sax. *ƿræpc, ƿræac*;

STAR'LY, *adv.* } Teutonic *stark*; Belg. *sterck*. Stiff; strong; rugged: in the highest degree; stiffly; strongly.

Then are the best but *stark* naught; for open suspecting others, comes of secret condemning themselves.

Sidney.

His heavy head devoid of careful cark,
Whose senses all were straight benumbed and *stark*.

Spenser.

The fruitful headed beast, amaz'd
At flashing beams of that sun-shiny shield,
Became *stark* blind, and all his senses doz'd,
That down he tumbled.

Id.

The north is not so *stark* and cold.

Ben Jonson.

Many a nobleman lies *stark* and stiff

Under the hoofs of vaunting enemies.

Shakspeare. Henry IV.

As fast locked up in sleep as guiltless labour,
When it lies *starkly* in the traveller's bones.

Shakspeare.

Those seditious, that seemed moderate before, became desperate, and those who were desperate seemed *stark* mad; whence tumults, confused hallooing and howlings.

Hayward.

He is *stark* mad, whoever says

That he hath been in love an hour.

Donne.

Men and women go *stark* naked.

Abbot.

They both dance much; and, for more nimbleness, sometimes *stark* naked.

Heylin.

To turn *stark* fools, and subjects fit

For sport of boys, and rabble wit.

Hudibras.

Who, by the most cogent arguments, will disrobe himself at once of all his old opinions, and turn himself out *stark* naked in quest of new notions?

Locke.

He pronounces the citation *stark* nonsense.

Collier.

In came squire South, all dressed up in feathers and ribbons, *stark* staring mad, brandishing his sword.

Arbutnot.

So soon as this spring is become *stark* enough, it breaks the case in two, and slings the seed.

Denham's Physico-Theology.

STARK (John), of Killermont, of an ancient and respectable Scottish family, was a covenanter; and having appeared in arms against his sovereign at the battle of Bothwell bridge, in 1679, became obnoxious to the government, and, to conceal himself, withdrew into Ireland. After residing a few years in the country which he had chosen for the scene of his banishment, he married Elizabeth, daughter of Thomas Stewart, Esq., of Balydrene, in the north of Ireland, descended of the noble family of Galloway. By this lady Mr. Stark had several children; particularly—

STARK (Thomas), his second son, who settled at Manchester as a wholesale linen-draper, and married Margaret Stirling, daughter of William Stirling, Esq., of Northwood side, in the neighbourhood of Glasgow, by whom he had the doctor.

STARK (the Rev. John), another son of the covenanter, was minister of Lecropt, in Perthshire; and, under his care, the doctor, his nephew, upon whom we are chiefly to enlarge, received the rudiments of that education which, from the character of the master, and the relation between him and his pupil, was well calculated to store the mind of Dr. Stark with those virtuous principles which influenced his conduct through life.

STARK (William), M. D., the son of Thomas, grandson of the covenanter, and nephew of the parson, was born at Manchester in July 1740, and educated by his uncle John above mentioned.—From Lecropt young Stark was sent to the university of Glasgow, where, under the tuition of Drs. Smith and Black, he learned the rudiments of science, and acquired that mathematical accuracy and contempt of hypotheses with which he prosecuted all his studies. Having chosen physic for his profession, he removed from the university of Glasgow to that of Edinburgh, where he was soon distinguished, and honored with the friendship of the late Dr. Cullen. Mr. Stark, in 1765, went to London, and devoted himself to the study of physic and surgery; and, looking upon anatomy as the principal pillar of both these arts, he endeavoured to complete with Dr. Hunter what he had begun with Dr. Monro; and under these two eminent professors he appears to have acquired a high degree of anatomical knowledge. He likewise en-

tered about this time a pupil at St. George's hospital; for, being disgusted with the inaccuracy of the most of practical writers, he determined to have, from his own experience, a standard, by which he might judge of the experience of others. With what success he prosecuted this plan, may be seen in a series of Clinical and Anatomical Observations made by him during his attendance at the hospital, and published after his death by his friend Dr. Carmichael Smyth. Whilst attending the hospital, he likewise employed himself in making experiments on the blood, and other animal fluids; and also in a course of experiments in chemical pharmacy; but these experiments have not yet been published. In 1767 Mr. Stark went to Leyden, and took the degree of M. D., publishing an inaugural dissertation on the dysentery. On his return to London he recommenced his studies at the hospital. In 1769 he commenced a series of Experiments on Diet, which he was encouraged to undertake by Sir John Pringle and Dr. Franklin, from whom he received many hints respecting the plan and its execution. But the imprudent zeal with which he prosecuted these, proved, in the opinion of his friends, fatal to himself; for he began them on the 12th of July 1769, in perfect health and vigor, and from that day, though his health varied, it was seldom if ever good, till the 23d of February 1770, when he died, after suffering much uneasiness. His biographer Dr. Smyth thinks that other causes, particularly chagrin and disappointment, had no small share in hastening his death; but his opinion seems not well-founded; for the pernicious effects of the experiments are visible in Dr. Stark's own journal. When he entered upon them, his body weighed twelve stone three pounds avoirdupois, which in a very few days was reduced to eleven stone ten pounds eight ounces: and it continued on the whole to decrease till the day of his death. This can excite no wonder. Though the professed object of his experiments was to prove that a pleasant and varied diet is equally conducive to health with a more strict and simple one, most of the dishes which he ate during these experiments were neither pleasant nor simple, but compounds, such as every stomach must nauseate. He began with bread and water; from which he proceeded to bread, water, and sugar; then to bread, water, and oil of olives; then to bread and water with milk; afterwards he tried bread and water with roasted goose; bread and water with boiled beef; stewed lean of beef with the gravy and water without bread; stewed lean of beef with the gravy, oil of fat, or suet and water; flour, oil of suet, water, and salt; flour, water, and salt; and a number of others infinitely more disagreeable to the stomach; such as bread, fat of bacon ham, and bread or flour with honey and the infusion of rosemary. Dr. Stark's experiments certainly indicate eccentricity of genius; but had the doctor calculated the effects of starvation upon the animal system, with the accuracy of the celebrated Napier the inventor of the logarithms, who was his ancestor, by both parents, he would have put a stop to them in time. But these experiments, of which a full account is given along with his

clinical and anatomical observations, display an uncommon degree of fortitude, perseverance, self-denial, and zeal for the promoting of useful knowledge in their author; and, with respect to his moral character, Dr. Smyth with great justice compared him to Cato, by applying to him what was said of that virtuous Roman by Sallust:—*'Non divitiis cum divite, neque factione cum factioso; sed cum strenuo virtute, cum modesto pudore, cum innocente abstinentia, certabat; esse quam videri bonus malebat.'*—*Sallust. Bell. Cat.*

STARK, a county of the east part of Ohio, United States, which has Harrison and Tuscarawa counties on the south, Columbiana and Wayne counties on the east, and Portage on the north. The first settlement of this county commenced in 1806: since which time the emigration has equalled, if not surpassed, any thing ever witnessed in any part of the state. In 1815 the population was estimated at 9450.

STARKENBURG, one of the three large provinces of the grand duchy of Hesse-Darmstadt. It lies between the Rhine and the Maine, the one forming the west, the other the north boundary. Its extent is about 1060 square miles; population nearly 200,000. It forms the southern part of the grand duchy, contains the Bergstrass and one of the most picturesque parts of Germany. The vegetables consist of wheat, barley, oats, and flax; also of the fruits of the kind usual in this latitude, among which, in favorable situations, are vines. Offenbach is the only manufacturing place in the province. The chief town is Darmstadt, the capital of the principality; but the province takes its name from a castle situated on an eminence in the Bergstrass, near the town of Heppenheim. See HESSE-DARMSTADT.

STARLING, *n. s.* Sax. *ŕæppling*; Lat *sturnus*. A small singing bird.

I will have a starling taught to speak
Nothing but Mortimer, and give it him,
To keep his anger still in motion.

Shakespeare. Henry IV.

STARLING. See STURNUS.

STARLINGS, or STERLINGS, the name given to the strong pieces of timber which were driven into the bed of the river to protect the piles, on the top of which were laid the flat beams upon which were built the bases of the stone-piers that support the arches of London bridge. In general, starlings are large piles placed on the outside of the foundation of the piers of bridges, to break the force of the water, and to protect the stonework from injury by floating ice. They are otherwise called jettes, and their place is often supplied by large stones thrown at random round the piers of bridges, as may be seen at Stirling bridge where the river is low; and as was done by Mr. Smeaton's direction round the piers of the centre arch of London bridge, when it was thought in danger of being undermined by the current. See SMEATON.

STARNINA (Gerard), an historical painter, born at Florence in 1354. He was a disciple of Venetiano, and was much employed and patronized by Alphonso XI. king of Castile. He died in 1403.

STAROSITY The government of a castle ;
the same with capitaneate.

STAR'RING, *adj.* Lat. *stellans*, from *star*.
Shining with stellar light ; blazing with sparkling
light.

STAR-SHOOT, or **STAR-SHOT**, a gelatinous sub-
stance often found in fields, and supposed by
the vulgar to have been produced from the me-
teor called a falling-star : but, in reality, the
half-digested food of herons, sea-mews, and the
like birds ; which have been found, when shot,
to disgorge a substance of the same kind.

STAR-STONES, in the old mineralogy, fossil
stones, resembling radiated stars, with a greater
or smaller number of rays in the different spec-
ies : they are usually found about an inch in
length, and of the thickness of a goose-quill.
Some have five angles or rays, others only four ;
in some the angles are equidistant, in others ir-
regularly so : in some they are short and blunt,
in others long, narrow, and pointed ; and some have
their angles very short and obtuse. The several
joints in the same specimen are usually all of the
same thickness ; but in some they are larger at
one end, and in others at the middle, than in
any other part of the body ; and some species
have one of the rays bifid, so as to emulate the
appearance of a six-rayed kind. See **ASTERIA**.

START, *v. n., v. a., & n. s.* } Teut. *sturtzen* ;

START'ER, *n. s.* } Belgic, *sterten*.

START'INGLY, *adv.* } To feel a sudden

START'LE, *v. n., v. a., & n. s.* } and involuntary

START'UP, *n. s.* } twitch of the animal

frame ; hence to rise or move suddenly ; to
wince ; shrink ; deviate ; set out on a race or
pursuit : as a verb active to alarm ; make to fly ;
rouse ; hence to discover ; put suddenly out of
place : a start is a sudden motion or twitch, fit
or sally ; act of starting : ' to get the start ' is, to
get off before another : a starter either one who
suddenly shrinks from his purpose or, by a singu-
lar mutation of language, one who first moves
a question or objection : the adverb corresponds
with start and startle : to startle is, to shrink :
to affright ; shock ; deter ; cause to deviate : a startle,
a sudden shock or alarm : a startup, one who
comes suddenly into notice.

The present occasion has *started* the dispute
amongst us. *Lesley.*

The lords and gentlemen take all the meaner sort
upon themselves ; for they are best able to bring
them in, whensoever any of them *starteth* out.

Spenser on Ireland.

There *started* up, in queen Elizabeth's reign, a new
presbyterian sect, which tendered a form of discipline
to the queen and to the state. *Whitgift.*

A shape appeared

Bending to look on me : I *started* back,
It *started* back. *Shakespeare.*

What trick, what *starting* hole, can'st thou find
out, to hide thee from this open shame ?

Id. Henry IV.

Direness familiar to my slaughterous thoughts,
Cannot once *start* me. *Shakespeare.*

The blood more stirs,

To rouse a lion than to *start* a hare. *Id.*

These flaws and *starts* would well become
A woman's story at a winter's fire,
Authorized by her grandam. *Shakespeare.*

How much had I to do to calm his rage !
Now fear I this will give it *start* again. *Id. Hamlet.*

Thou art like enough through vassal fear,
Base inclination, and the *start* of spleen,
To fight against me under Percy's pay. *Shakespeare.*
Methought her eyes had crossed her tongue ;
For she did speak in *starts* distractedly. *Id.*
You stand like greyhounds in the slips,
Straining upon the *start*. *Id. Henry V.*
Get the start of the majestick world.

Id. Julius Cæsar.

Why do you speak so *startingly* and rash ?

Id. Othello.

That young *start up* hath all the glory of my over-
throw. *Shakespeare.*

Starting is an apprehension of the thing feared,
and in that kind it is a motion of shrinking ; and
likewise an inquisition, in the beginning, what the
matter should be, and in that kind it is a motion of
erection ; and, therefore, when a man would listen
suddenly to any thing, he *starteth* ; for the *starting* ;
is an erection of the spirits to attend.

Bacon's Natural History.

If a man deal with another upon conditions, the
start of first performance is all. *Bacon.*

All pretorian courts, if any of the parties be laid
asleep, under pretence of arbitrement, and the other
party during that time doth cautiously *get the start*
and advantage at common law, yet the pretorian
court will set back all things in statu quo prius.

Bacon's War with Spain.

Both cause the string to give a quicker *start*.

Bacon.

All leapt to chariot,

And every man then for the *start* cast in his proper
lot. *Chapman.*

Thy forms are studied arts,

Thy subtle ways be narrow straits,

Thy curtesy but sudden *starts*,

And what thou call'st thy gifts are baits.

Ben Jonson.

An open enemy to flattery, especially from a
friend, from whom he *started* to meet the slightest
appearance of that servile kindness. *Fell.*

Doubtless some other heart

Will *get the start* ;

And, stepping in before,

Will take possession of the sacred store

Of hidden sweets.

Crashaw.

The flowers, called out of their beds,

Start and raise up their drowsy heads. *Cleaveland.*

What exception can possibly be *started* against this
stating ? *Hanmoud*

Th' old drudging sun from his long-beaten way

Shall at thy voice *start* and misguide the day ;

The jocular orbs shall break their measured pace,

And stubborn poles change their allotted place.

Cowley.

Should some god tell me, that I should be born

And cry again, his offer I should scorn ;

Ashamed, when I have ended well my race,

To be led back to my first *starting* place. *Denham.*

I rank him with the prodigies of fame,

With things which *start* from nature's common rules,

With bearded infants, and with teeming mules.

Creech.

They would find occasions enough, upon the ac-
count of his known affections to the king's service,
from which it was not possible to remove or *startle*
him. *Clarendon.*

Such whispering waked her, but with *startled* eye
On Adam. *Milton.*

To hear the lark begin his flight,

And singing *startle* the dull night

From his watch-tower in the skies,

Till the dappled dawn doth rise. *Id.*

Stand to it boldly, and take quarter,
To let thee see I am no *starter*. *Hudibras.*

Ere the night could do his part,
The squire had *got* so much the *start*,
H' had to the lady done his errand,
And told her all his tricks aforehand. *Id.*

The reason why the mathematicks and mechanic
arts have so much *got* the *start* in growth of other
sciences, may be resolved into this, that their progress
hath not been retarded by that reverential awe of
former discoveries. *Glanville.*

Charmed by these strings, trees *starting* from the
ground,
Have followed with delight the powerful sound. *Roscommon.*

Fair course of passion, where two lovers *start*,
And run together, heart still yoked with heart. *Waller.*

It seems to be rather a terminus a quo than a true
principle, as the *starting* post is none of the horse's
legs. *Boyle.*

The sensual men agree in pursuit of every pleasure
they can *start*. *Temple.*

As his doubts decline,
He dreads just vengeance and he *starts* at sin. *Dryden.*

They *starting* up beheld the heavy sight. *Id.*
A spirit fit to *start* into an empire,
And look the world to law. *Id. Cleomene.*

The fright awakened Arcite with a *start* ;
Against his bosom bounced his heaving heart. *Dryden.*

She might have forsaken him if he had not *got* the
start of her. *Id. Æneid. Dedication.*

The *startling* steed was seized with sudden fright,
And, bounding, o'er the pomel cast the knight. *Dryden.*

People, when they have made themselves weary,
set up their rest upon the very spot where they
started. *L' Etrange.*

Nature does nothing by *starts* and leaps, or in a
hurry ; but all her motions are gradual. *Id.*

The very print of a fox-foot would have *started* ye. *Id.*

The mind often works in search of some hidden
idea, though sometimes they *start* up in our minds of
their own accord. *Locke.*

The supposition that angels assume bodies needs
not *startle* us, since some of the most ancient and
most learned fathers seemed to believe that they had
bodies. *Id.*

Incest ! Oh name it not !
The very mention shakes my inmost soul :
The gods are *startled* in their peaceful mansions,
And nature sickens at the shocking sound. *Smith.*

How could water make those visible *starts* upon
freezing, but by some subtle freezing principle which
as suddenly shoots into it ? *Grew's Cosmologia Sacra.*

It was unadvisedly done, when I was enforcing a
weightier design, to *start* and follow another of less
moment. *Sprat.*

After having recovered from my first *startle*, I was
very well pleased at the accident. *Spectator.*

The French year has *got* the *start* of ours more in
the works of nature than in the new style. *Addison.*

Why shrinks the soul
Back on herself, and *startles* at destruction ? *Id. Cato.*

Are they not only to disguise our passions,
To set our looks at variance with our thoughts,
To check the *starts* and sallies of the soul ? *Id.*

Insignificant cavils may be *started* against every
thing that is not capable of mathematical demonstration.
Addison.

An ambiguous expression, a little chagrin, or a
start of passion, is not enough to take leave upon. *Collier.*

His books had been solemnly burnt at Rome as
heretical : some people, he found, were *startled* at it ;
so he was forced boldly to make reprisals, to buoy up
their courage. *Atterbury.*

One, by a fall in wrestling, *started* the end of the
clavicle from the sternon. *Wiseman's Surgery.*

I *started* from his vernal bower
The rising game, and chased from flower to flower. *Pope.*

Might Dryden bless once more our eyes,
New Blackmores and new Milbourns must arise
Nay, should great Homer lift his awful head,
Zoilus again would *start* up from the dead. *Id.*

She at the summons rolled her eyes around,
And snatched the *starting* serpents from the ground. *Id.*

Keep your soul to the work when ready to *start*
aside, unless you will be a slave to every wild imagi-
nation. *Watts.*

Now the leaf
Incessant rustles, from the mournful grove
Oft *startling* such as studious walk below,
And slowly circles through the waving air. *Thomson.*

If Sheridan was not the staunchest hound in the
pack he was at least the best *starter*. *Delany.*

STARVE, *v. n. & v. a.* } Sax. *fræppan* ;
STARVELING, *adj. & n. s.* } Belg. *sterven* ;
Goth. *starva*. To perish ; be destroyed : particu-
larly to perish with hunger or cold ; be killed
with cold ; suffer extreme destitution : as a verb
active to kill with hunger, or cold ; deprive of
force or vigor : *starveling* is hungry ; lean ; a
thin or lean animal ; a pining wretch.

Have I seen the naked *starve* for cold,
While avarice my charity controlled ? *Sandys.*

Thy desires
Are wolfish, bloody, *starved*, and ravenous. *Shakspeare.*

If I hang, I'll make a fat pair of gallows ; for
old sir John hangs with me, and he's no *starveling*. *Id.*

Now thy alms is given, the letter's read ;
The body risen again, the which was dead ;
And thy poor *starveling* bountifully fed. *Donne.*

To her came message of the murderment,
Wherein her guiltless friends should hopeless *starve*. *Fairfax.*

From beds of raging fire to *starve* in ice
Their soft ethereal warmth, and there to pine
Immoveable, infixed, and frozen round. *Milton.*
He would have worn her out by slow degrees,
As men by fasting *starve* the untamed disease. *Dryden.*

The fat ones would be making sport with the lean,
and calling them *starvelings*. *L' Etrange.*

Were the pains of honest industry, and of *starv-*
ing with hunger and cold, set before us, no body
would doubt which to chuse. *Lacke.*

The powers of their minds are *starved* by disuse,
and have lost that reach and strength which nature
fitted them to receive. *Id.*

The thronging clusters thin
By kind avulsion ; else the *starveling* brood,
Void of sufficient sustenance, will yield
A slender autumn. *Philips.*

Hunger and thirst, or guns and swords,
Give the same death in different words.
To push this argument no further,
To *starve* a man in law is murder. *Prior.*

An animal that *starves* of hunger, dies feverish and delirious. *Arbutnot.*

Had the seeds of the pepper-plant been borne from Java to these northern countries, they must have *starved* for want of sun.

Woodward's Natural History.

Sometimes virtue *starves* while vice is fed:

What then? is the reward of virtue bread? *Pope.*

If they had died through fasting, when meat was at hand, they would have been guilty of *starving* themselves. *Id.*

Poor *starveling* bard, how small thy gains!

How unproportioned to thy pains! *Swift.*

All Europe must agree

Ten *starveling* hermits suffer less than he. *Cowper.*

STATE, *n. s. & v. a.* } *Fr. etate; Lat. statu-*
STATE'LY, *adj. & adv.* } *tus.* Condition; cir-
STATE'LINESS, *n. s.* } cumstances of nature
STATES'MAN, } or fortune; crisis;
STATES'WOMAN, } height: hence national
STAT'IST. } dignity or rank; sig-

nifery; estate; possession: dignity: a commonwealth; civil power; to regulate or settle condition or terms: to represent circumstantially: stately is august; grand; magnificent: used by Milton as an adverb: the noun substantive following corresponding: a statesman is one versed in arts of government; a politician: a stateswoman, a politician in petticoats: a statist is a statesman.

The same criminal may be absolved by the church and condemned by the *state*; absolved or pardoned by the *state*, yet censured by the church. *Lesley.*

If such actions may have passage free, Bond-slaves and pagans shall our *statesmen* be.

Shakspeare. Othello.

This chair shall be my *state*, this dagger my sceptre, and this cushion my crown.

Id. Henry IV.

Fair dame, I am not to you known, Though in your *state* of honour I am perfect.

Shakspeare.

My thought, whose murder yet is but fantastical, Shakes so my single *state* of man, that function Is smothered in surmise. *Id. Macbeth.*

I do believe,

Statist though I am none or like to be, That this shall prove a war. *Id. Cymbeline.*

A *statelier* pyramid to her I'll rear, Than Rhodope's or Memphis' ever was.

Id. Henry VI.

These regions have abundance of high cedars, and other *statelily* trees casting a shade.

Raleigh's History.

I am no courtier, nor versed in *state* affairs: my life hath rather been contemplative than active. *Bacon.*

Over the chair is a *state* made round of ivy, somewhat whiter than ours; and the *state* is curiously wrought with silver and silk. *Id.*

She instructed him how he should keep *state*, and yet with a modest sense of his misfortunes.

Id. Henry VII.

The *state* hath given you licence to stay on land for the space of six weeks. *Bacon.*

It is better the kingdom should be in good estate, with particular loss to many of the people, than that all the people should be well, and the *state* of the kingdom altogether lost. *Hayward.*

High *state* the bed is where misfortune lies.

Fairfax.

It looks grave enough

To seem a *statesman*.

Ben Jonson.

A *state's* anger

Should not take knowledge either of fools or women.

Id.

How she was in debt, and where she meant To raise fresh sums: she's a great *stateswoman*! *Id.*

It is a bad exchange to wound a man's own conscience, thereby to *state* sores. *King Charles.*

Were our case *stated* to any sober heathen, he would never guess why they who acknowledge the necessity of prayer, and confess the same God, may not ask in the same form. *Decay of Piety.*

This is so *stated* a rule that all casuists press it in all cases of damage. *Id.*

Strong was their plot,

Their *states* far off, and they of wary wit. *Daniel.*

What he got by fortune,

It was the *state* that now must make his right. *Id.*

No *state* can be named wherein any part of the body of those imperial laws hath the just force of a law, otherwise than as custom hath particularly induced it. *Selden.*

Their sins have the aggravation of being sins against grace, and forsaking and departing from God; which respect makes the *state* of apostates, as the most inexcusable, so the most desperately dangerous *state*. *Hammond.*

Many other inconveniences are consequent to this *stating* of this question; and particularly that, by those which thus *state* it, there hath never yet been assigned any definite number of fundamentals.

Id. On Fundamentals.

The swan rows her *state* with oary feet. *Milton.*

He many a walk traversed

Of *stateliest* covert, cedar, pine, or palm. *Id.*

Ye that *statelily* tread or lowly creep. *Id.*

I do not

Infer as if I thought my sister's *state*

Secure. *Id.*

The bold design

Pleased highly those infernal *states*. *Id.*

Their orators thou then extoltest, as those

The top of eloquence, *statists* indeed,

And lovers of their country.

Id. Paradise Regained.

Since they all live by begging, it were better for the *state* to keep them. *Graunt.*

Its present *state* *stateth* it to be what it now is.

Hale.

He was staid, and in his gait

Preserved a grave majestick *state*. *Butler.*

The deer, that endureth the womb but eight months, and is complete at six years, cannot live much more than thirty, as having passed two general motions, that is, its beginning and increase; and having but two more to run through, that is its *state* and declination. *Brown's Vulgar Errors.*

I found the whole city highly concerned for the hazardous *state* of Candia, which was lost soon after. Dominico Cantarini, the present duke, was selulous in that affair. *Brown's Travels.*

When in triumphant *state* the British muse, True to herself, shall bab'rous aid refuse.

Roscommon.

For *stateliness* and majesty what is comparable to a horse? *More's Antidote against Atheism.*

For you we staid, as did the Grecian *state*

Till Alexander came. *Waller.*

Such cheerful modesty, such humble *state*,

Moves certain love. *Id.*

Keep the *state* of the question in your eye.

Boyle.

They feared nothing from a *state* so narrow in compass of land, and so weak, that the strength of

their armies has ever been made up of foreign troops.
Temple.

Agenor, glad such punctual ready bliss
Did on his own design itself obtrude,
Swelled his vast looks to bigger *stateliness*.
Beaumont's Psyche.

Council! What's that? a pack of bearded slaves,
The scavengers that sweep *state* nuisances,
And are themselves the greatest.
Dryden's Cleomenes.

These are the realms of unrelenting fate;
And awful Rhadamanthus rules the *state*;
He hears and judges.
Id. Æneid.

Relate what Latium was;
Declare the past and present *state* of things. *Id.*
He maintains majesty in the midst of plainness,
and is *stately* without ambition, which is the vice of
Lucan. *Id.*

Let my attendants wait; I'll be alone:
Where least of *state*, there most of love is shown.
Id.

To *state* it fairly, imitation is the most advanta-
geous way for a translator to shew himself, but the
greatest wrong which can be done to the memory of
the dead. *Id.*

She hated *stateliness*; but wisely knew
What just regard was to her title due. *Betterton.*

Absolute power is not a plant that will grow in
this soil; and *statesmen*, who have attempted to culti-
vate it here, have pulled on their own and their
master's ruin. *Davenant.*

It is a weakness which attends high and low; the
statesman who holds the helm, as well as the peasant
who holds the plough. *South.*

Truth, like a *stately* dome, will not show herself at
the first visit. *Id.*

We may collect the excellency of the understand-
ing then by the glorious remainders of it now, and
guess at the *stateliness* of the building by the mag-
nificence of its ruins. *Id.*

Several objects may innocently be ridiculed, as the
passions of our *stateswomen*. *Addison.*

A British minister must expect to see many friends
fall off, whom he cannot gratify; since, to use the
phrase of a late *statesman*, the pasture is not large
enough. *Id.*

He is capable of corruption who receives more
than what is the *stated* and unquestioned fee of his
office. *Id.*

At home surrounded by a servile crowd,
Prompt to abuse, and in detraction loud,
Abroad begirt with men, and swords, and spears,
His very *state* acknowledging his fears. *Prior.*

To appear in their robes would be a troublesome
piece of *state*. *Collier.*

This is to *state* accounts, and looks more like mer-
chandise than friendship. *Id. On Friendship.*

I pretended not fully to *state*, much less demon-
strate, the truth contained in the text. *Atterbury.*

The brain was her study, the heart her *state* room.
Arbutnot.

Tumours have their several degrees and times;
as beginning, augment, *state*, and declination.
Wiseman.

The corruption of a poet is the generation of a
statesman. *Pope.*

Can this imperious lord forget to reign,
Quit all his *state*, descend, and serve again?
Id. Statius.

Like the papist's is your poet's *state*,
Poor and disarmed. *Pope.*

Here Britain's *statesmen* oft the fall foredoom
Of foreign tyrants, and of nymphs at home. *Id.*

I am accused of reflecting upon great *states*-folks.
Swift.

Thus have his prayers for others altered and
amended the *state* of his own heart. *Law.*

Though I don't pretend to *state* the exact degree
of mischief that is done by it, yet its plain and nat-
ural tendency to do harm is sufficient to justify the
most absolute condemnation of it. *Id.*

He will consider, not what arts, or methods, or
application will soonest make him richer and greater
than his brethren, or remove him from a shop to a
life of *state* and pleasure; but will consider what
arts, what methods, what application can make
worldly business most acceptable to God, and make
a life of trade a life of holiness, devotion, and piety.
Id.

STATES, or ESTATES, a term applied to several
orders or classes of people assembled to consult
of matters for the public good.

STATES GENERAL was the name of the ci-de-
vant assembly consisting of the deputies of the
seven United Provinces. These were usually
thirty in number, some provinces sending two,
others more; and, whatever resolution the states
general took, must be confirmed by every pro-
vince, and by every city and republic in that
province, before it had the force of a law. The
deputies of each province had only but one
voice, and were esteemed as but one person, the
votes being given by provinces: each province
presided in the assembly in its turn, according to
the order settled among them; Guelderland
first, then Holland, &c.

STATES OF HOLLAND were the deputies of
eighteen cities, and one representative of the
nobility, constituting the states of the province
of Holland: the other provinces have likewise
their states, representing their sovereignty; de-
puties from which make what they call the states-
general. In an assembly of the states of a par-
ticular province one dissenting voice prevents
their coming to any resolution.

STATES, UNITED See AMERICA.

STATICE. thrift, or sea pink, in botany, a
genus of plants belonging to the class pentandria,
order pentagynia; natural order forty-eighth,
aggregate: CAL. monophyllous, entire, folded,
and scariose. There are five petals with one
superior seed. There are twenty-two species,
viz. 1. *S. armeria*; 2. *auræa*; 3. *cordata*; 4.
eschinus; 5. *echioides*; 6. *ferulæcea*; 7. *flexu-
osa*; 8. *incana*; 9. *limonium*; 10. *linifolia*;
11. *lobata*; 12. *minuta*; 13. *monopetala*; 14.
mucronata; 15. *pruinosa*; 16. *pseud-armeria*;
17. *purpurata*; 18. *reticulata*; 19. *sinuata*; 20.
speciosa; 21. *suffruticosa*; and, 22. *Tartarica*.
Of these, three species are natives of Britain,
viz:—

1. *S. armeria*, thrift or sea gilly-flower, has a
simple naked stem, about six inches high. The
radical leaves are like grass. The flowers are
terminal, pale red, with a round head, and not
very large. This plant flowers in July or Au-
gust, and grows in meadows near the sea.

2. *S. limonium*, sea-lavender. The stem is
naked, branched, and about a foot high. The
radical leaves are long, pointed, and grow on
foot-stalks. The flowers are blue, and grow on
long spikes on the tops of the branches. It
grows on the sea-coast in South Britain.

3. *S. reticulata*, matted sea-lavender. The
stem is prostrate, and terminated by a panicle of

flowers. The branches are naked, barren, and bent back. The leaves are wedge-shaped. This species are also found on the sea-coast of South Britain.

STATICS, *n. s.* } Gr. *στατική*; Fr. *sta-*
 STATICAL, *adj.* } *tique*. The science which considers the weight of bodies: the adjective corresponding.

A man weigheth some pounds less in the height of winter, according to experience, and the *statick* aphorisms of Sanctorius. *Browne's Vulgar Errors.*

If one by a *statical engine* could regulate his insensible perspiration, he might often, by restoring of that, foresee, prevent, or shorten a fit of the gout.

Arbutnot on Diet.

This is a Catholic rule of *statics*, that if any body be bulk for bulk heavier than a fluid it will sink to the bottom; and if lighter it will float upon it, having part extant, and part immersed, as that so much of the fluid as is equal in bulk to the immersed part be equal in gravity to the whole.

Bentley.

STATICS is a term which the modern improvements in the arts have made necessary to introduce into physico-mathematical science. It was found convenient to distribute the doctrines of universal mechanics into two classes, which required both a different mode of consideration and different principles of reasoning. Till the time of Archimedes little science of this kind was possessed by the ancients, from whom we have received the first rudiments. His investigation of the centre of gravity, and the theory of the lever, are the foundations of our knowledge of common mechanics; and his theory of the equilibrium of floating bodies contains the greatest part of our hydrostatical knowledge. But it was as yet limited to the simplest cases; and there were some in which Archimedes was ignorant, or was mistaken. The marquis Guido Ubuldi, in 1578, published his *Theory of Mechanics*, in which the doctrines of Archimedes were well explained and considerably augmented. Stevinus, the celebrated Dutch engineer, published about twenty years after an excellent *System of Mechanics*, containing the chief principles which now form the science of equilibrium among solid bodies. In particular, he gave the theory of inclined planes, which was unknown to the ancients, though it is of the very first importance in almost every machine. He even states in the most express terms the principle, afterwards made the foundation of the whole of mechanics, and published as a valuable discovery by Varignon, viz. that three forces, whose directions and intestines are as the sides of a triangle, balance each other. His theory of the pressure of fluids, or hydrostatics, is no less estimable, including every thing that is now received as a leading principle in the science. When we consider the ignorance, even of the most learned of that age, in mechanical or physico-mathematical knowledge, we must consider those performances as the works of a great genius, and we regret that they are so little known, being lost in a crowd of good writings on those subjects which appeared soon after. Hitherto the attention had been turned entirely to equilibrium, and the circumstances necessary for producing it. Mechanicians indeed saw that the energy of a machine

might be somehow measured by the force which could be opposed or overcome by its intervention; but they did not remark that the force which prevented its motion, but did no more than prevent it, was an exact measure of its energy, because it was in immediate equilibrio with the pressure exerted by that part of the machine with which it was connected. If this opposed force was less, or the force acting at the other extremity of the machine was greater, the mechanicians knew that the machine would move, and that work would be performed; but what would be the rate of its motion, or its performance, they hardly pretended to conjecture. They had not studied the action of moving forces, nor conceived what was done when motion was communicated. The great Galileo opened a new field of speculation, in his work on *Local Motion*. He there considers a change of motion as the indication and exact and adequate measure of a moving force; and he considers every kind of pressure as competent to the production of such changes.—He contented himself with the application of this principle to the motion of bodies by the action of gravity, and gave the theory of projectiles, which remains to this day without change, and only improved by considering the changes which are produced in it by the resistance of the air. See *PROJECTILES*.

Sir Isaac Newton took up this subject nearly as Galileo had left it. For, if we except the theory of the centrifugal forces arising from rotation, and the theory of pendulums published by Huygens, hardly any thing had been added to the science of motion. Newton considered the subject in its utmost extent; and in his mathematical principles of natural philosophy he considers every conceivable variation of moving force, and determines the motion resulting from its action. His first application of these doctrines was to explain the celestial motions: and the magnificence of this subject caused it to occupy for a while the whole attention of the mathematicians. But the same work contained propositions equally conducive to the improvement of common mechanics, and to the complete understanding of the mechanical actions of bodies. Philosophers began to make these applications also. They saw that every kind of work which is to be performed by a machine may be considered abstractedly as a retarding force; that the impulse of water or wind, which are employed as moving powers, act by means of pressures which they exert on the impelled point of the machine; and that the machine itself may be considered as an assemblage of bodies moveable in certain limited circumstances, with determined directions and proportions of velocity. From all these considerations resulted a general abstract condition of a body acted on by known powers. And they found that, after all conditions of equilibrium were satisfied, there remains a surplus of moving force. They could now state the motion which will ensue, the new resistance which this will excite, the additional power which this will absorb; and they at last determined a new kind of equilibrium, not thought of by the ancient mechanicians, between the resistance to the machine performing work and the moving power, which

exactly balance each other, and is indicated, not by the rest, but by the uniform motion of the machine. In like manner, the mathematician was enabled to calculate that precise motion of water which would completely absorb, or, in the new language, balance the superiority of pressure by which water is forced through a sluice, a pipe, or canal, with a constant velocity. Thus the general doctrines of motion came to be considered in two points of view, according as they balanced each other in a state of rest or of uniform motion. These two ways of considering the same subject required both different principles and a different manner of reasoning. The first has been named *statics*, as expressing that rest which is the test of this kind of equilibrium. The second has been called *dynamics*, or universal mechanics, because the different kinds of motion are characteristic of the powers or forces which produce them. A knowledge of both is indispensably necessary for acquiring any useful practical knowledge of machines; and it was ignorance of the doctrines of accelerated and retarded motions which made the progress of practical mechanical knowledge so very slow and imperfect. The mechanics, even of the moderns, before Galileo, went no further than to state the proportion of the power and resistance which would be balanced by the intervention of a given machine, or the proportion of the parts of a machine by which two known forces may balance each other. This view of the matter introduced a principle which even Galileo considered as a mechanical axiom, viz. that what is gained in force by means of a machine is exactly compensated by the additional time which it obliges us to employ. This is false in every instance, and not only prevents improvement in the construction of machines, but leads us into erroneous maxims of construction. The true principles of dynamics teach us that there is a certain proportion of the machine, dependent on the kind and proportion of the power and resistance; which enables the machine to perform the greatest possible work. It is highly proper therefore to keep separate these two ways of considering machines, that both may be improved to the utmost, and then to blend them together in every practical discussion. Statics therefore is preparatory to the proper study of mechanics; but it does not hence derive all its importance. It is the sole foundation of many useful parts of knowledge. This will be best seen by a brief enumeration. 1. It comprehends all the doctrines of the excitement and propagation of pressure through the parts of solid bodies, by which the energies of machines are produced. A pressure is exerted on the impelled point of a machine, such as the float-boards or buckets of a mill-wheel. This excites a pressure at the pivots of its axle, which act on the points of support. This must be understood, both as to direction and intensity, that it may be effectually resisted. A pressure is also excited at the acting tooth of the cog-wheel on the same axle, by which it urges round another wheel, exciting similar pressures on its pivots and on the acting tooth perhaps of a third wheel. Thus a pressure is ultimately excited in the working part of the machine,

perhaps a wiper, which lifts a heavy stamper, to let it fall again on some matter to be pounded. Now statics teaches us the intensities and direction of all those pressures, and therefore how much remains at the working point of the machine unbalanced by resistance. 2. It comprehends every circumstance which influences the stability of heavy bodies; the investigation and properties of the centre of gravity; the theory of the construction of arches, vaults, and domes; the attitudes of animals. 3. The strength of materials, and the principles of construction, so as to make the proper adjustment of strength and strain in every part of a machine, edifice, or structure of any kind. Statics therefore furnishes us with what may be called a theory of carpentry, and gives us proper instructions for framing floors, roofs, centres, &c. 4. Statics comprehends the whole doctrine of the pressure of fluids, whether liquid or æriform, whether arising from their weight or from any external action. Hence therefore we derive our knowledge of the stability of ships, or their power of maintaining themselves in a position nearly upright, in opposition to the action of the wind on their sails. We learn on what circumstances of figure and stowage this quality depends, and what will augment or diminish it. See *HYDRAULICS*.

STATION, *n. s.* } Fr. *station*; Lat. *statio*.
STATIONARY, *adj.* } The act of standing; state
STATIONER, *n. s.* } of rest; position; employment; office; rank: to fix in a certain rank, or position: the adjective corresponding: a stationer, originally one who had a fixed place for selling paper or books.

Their manner was to stand at prayer, whereupon their meetings unto that purpose on those days had the names of *stations* given them. *Hooker*.

In *station*, like the herald, Mercury,
 New lighted on a heaven-kissing hill.

Shakspeare. Timon.
 The seditious remained within their *station*, which, by reason of the nastiness of the beastly multitude, might more fitly be termed a kennel than a camp.
Hayward.

To single *stations* now what years belong,
 With planets joined, they claim another song.

Creech.
 The planets in their *station* listening stood. *Milton.*
 Michael in either hand leads them out of Paradise, the fiery serpent waving behind them, and the cherubins taking their *stations* to guard the place. *Id.*

All progression is performed by drawing on or impelling forward some part which was before in *station* or at quiet, where there are no joints.

Browne's Vulgar Errors.
 The same harmony and *stationary* constitution, as it happened in many species, so doth it fall out in individuals.
Browne.

I can be contented with an humbler *station*, in the temple of virtue, than to be set on the pinnacle.

Dryden.
 Some modern tragedies are beautiful on the stage, and yet Tryphon the *stationer* complains they are seldom asked for in his shop.
Id.

No member of a political body so mean, but it may be used in some *station* or other. *L'Estrange.*
 By spending this day in religious exercises, we acquire new strength and resolution to perform God's will in our several *stations* the week following.

Nelson.

The fig and date, why love they to remain
In middle station, and an even plain ;
While in the lower marsh the gourd is found,
And while the hill with olive-shade is crowned ?

Prior.

Between the descent and ascent, where the image
Seemed stationary, I stopped the prism, and fixed it in
that posture that it should be moved no more.

Newton's Opticks.

With authors, stationers obeyed the call ;
Glory and gain the industrious tribe provoke,
And gentle Dulness ever loves a joke

Pope's Dunciad.

They believe that common size of the human
understanding is fitted to some station or other.

Swift.

STATIONARY, in astronomy, the state of a planet when, to an observer on the earth, it appears for some time to stand still, or remain immoveable in the same place in the heavens. For as the planets, to such an observer, have sometimes a progressive motion, and sometimes a retrograde one, there must be some point between the two where they must appear stationary.

STATIONERIES [Latin], post-offices, in Roman antiquity. See *Post*.

STATIRA, the daughter of Darius Codomanus, who was taken prisoner, and afterwards married by Alexander; and her sister Drypētis to his friend Hephæstion. After Alexander's death she was barbarously murdered by Roxana, another of Alexander's Persian queens. See *MACEDON*.

STATISTICAL PHILOSOPHY, a term applied by Sir John Sinclair to that new and important branch of science, statistics: a branch of science, or philosophy, the most useful and comprehensive of all others, as it comprehends indeed every thing interesting and important to mankind here and hereafter. Men of letters, in all ages and nations, have spent much time and labor in investigating the antiquities of their respective countries. The knowledge of these is useful in its place, nor does the science of statistics exclude antiquities; but it is only by a thorough knowledge of the present state of a country and its inhabitants, with their present customs, habits, morals, grievances, and manner of living (which are the chief objects of statistical philosophy), that a country can be improved, or the condition and circumstances of the people ameliorated. See the next article.

STATISTICS [from *status*, Latin, state, condition, &c.], a new and important branch of science lately introduced. The definition and illustration of the term, and its adjective, we shall give in the words of Sir John Sinclair:—'Many people,' says he, *Stat. Acc.* vol. XX. p. xiii., 'were at first surprised at my using the new words statistics and statistical, as it was supposed that some term in our own language might have expressed the same meaning. But, in the course of a very extensive tour through the northern parts of Europe, which I happened to take in 1786, I found that in Germany they were engaged in a species of political enquiry to which they had given the name of statistics; and though I apply a different idea to that word, for by statistical is meant, in Germany, an enquiry for the purpose of ascertaining the political

VOL. XXI.

strength of a country, or questions respecting matters of state; whereas the idea I annex to the term is an enquiry into the state of a country, for the purpose of ascertaining the quantum of happiness enjoyed by its inhabitants, and the means of its future improvement; yet, as I thought that a new word might attract more public attention, I resolved on adopting it, and I hope that it is now completely naturalised and incorporated with our language.' Impressed with these ideas, Sir John Sinclair commenced, carried on, and completed, the Statistical Account of Scotland, a work perhaps of the greatest magnitude, importance, and public utility, ever attempted by any individual. We shall here only add a few interesting particulars respecting the history and nature of this system of statistical philosophy. On the 25th May, 1790, Sir John circulated among the clergymen of the established church a series of 166 queries, accompanied by a proper circular letter, respecting the following and many other important particulars, in their respective parishes:—'The ancient and modern names of the parish; its situation and extent; number of acres; the soil and surface; nature and extent of the sea-coast; lakes, rivers, islands, hills, rocks, caves, woods, orchards, &c.; climate and diseases; instances of longevity; state of property; number of proprietors, resident and non-resident; mode of cultivation; implements of husbandry; manures; seed-time and harvest; remarkable good and bad seasons; quantity and value of crops; total value of the whole annual produce; total real and valued rent; prices of grain and provisions; quantity of grain and other articles consumed; wages and prices of labor; services exacted or abolished; commerce; manufactures; kelp, its amount, and the number employed in it; fisheries; towns and villages; police; inns and alehouses; roads and bridges; harbours; ferries, and their state; number of ships, vessels, and seamen; state of the church; stipend, manse, glebe, and patron; number of poor; parochial funds, and management; schools, and number of scholars; ancient and present state of population; causes of its increase or decrease; number of families; division of the inhabitants, by their birth places, ages, religious persuasions, occupations, and situation in life; residence, in town, village, or country; number of houses, inhabited or uninhabited; number of dove-cots, and to what extent they are destructive to the crops; number of horses, cattle, sheep, and swine, with their nature and value; minerals; mineral springs; fuel; eminent men; antiquities; parochial records; miscellaneous observations; character of the people; manners, customs, stature, &c.; advantages and disadvantages; means by which their situation could be meliorated.' Sir John, having received a number of returns to these queries in 1790, commenced the work, in January 1791, by printing statistical accounts of the first four parishes he had received, and dispersing 1000 extra copies of them with a second circular letter among the clergy. By such great and continued exertions, the first volume was published on the 25th May, 1791, and gave very general satisfaction. It is unnecessary to detail the history of every volume

H

of this important work. After writing many thousand letters, urging the clergy to transmit their accounts, Sir John found that on the 1st of June, 1792, no less than 413 accounts were still wanting. From the beginning of the publication the public-spirited baronet had devoted the profits of the work to the Society for the Benefit of the Sons of the Clergy. He had also, by the recommendation of Mr. Secretary Dundas, procured his majesty's royal grant of £2000 to that society. Still, however, a great number of the clergy continued dilatory in giving in their satistical reports, though the measure was publicly approved and recommended by the general assembly; as well as by the duke of Argyll, the earl of Leven, the earl of Fife, and other great men and patrons in the church. Sir John, however, being determined to complete the work, sent satistical missionaries to those parts of the kingdom from which he had received no returns; and thus, 'at last,' says he, 'on the 1st day of January 1798, or seven years, seven months, and seven days, from the commencement of the attempt, an account of every parish in Scotland was either given in, or might be relied on in a few days.' Sir John adds, in a note (p. xix.) 'only four accounts were wanting on that day.' The important work, unparalleled in the annals of literature,—the work of an individual who had the courage and perseverance to procure the assistant exertions of above 900 of the most learned men in the nation,—was completed by the publication of the twenty-first volume on the 20th May 1799. 'If similar surveys,' says the founder of British statistics—we say British, because the Parliamentary survey of England and Wales, in 1801, was also a suggestion of Sir John Sinclair's—'were instituted in the other kingdoms of Europe, it might be the means of establishing, on sure foundations, the principles of that most important of all sciences, viz. political or statistical philosophy; that is, the science which, in preference to every other, ought to be held in reverence. No science can furnish, to any mind capable of receiving useful information, so much real entertainment; none can yield such important hints for the improvement of agriculture, for the extension of commercial industry, for regulating the conduct of individuals, or for extending the prosperity of the state; none can tend so much to promote the general happiness of the species.' We have only to add that Sir John, in his twenty-first volume, announces that it is his 'intention, as soon as leisure from other pursuits will admit of it, to draw up the result of the whole enquiry in a publication, to be entitled Analysis of the Political State of Scotland, with a view of the Principles of Statistical Philosophy.'

STATIVA CASTRA, in archæology, standing camps. The ancient Romans accustomed their troops to remain occasionally under canvass, both in winter and summer; but these encampments were of short duration. At first they were only for a single night, and they were then named lodgments: but if they lasted several nights they were called *stativa*. The winter camps were always better supplied with provisions and warlike stores than the summer ones.

Whilst Rome was governed by emperors their armies were constantly in the field, or encamped upon the frontiers of the empire, both in peace and war. They were certainly less considerable in the first than in the latter instance, and they always remained in the camp during the winter as well as the summer months. Particular care was taken to have these camps well fortified, and abundantly provided with stores and provisions.

STATIUS (Cæcilius), a comic poet who flourished in the age of Ennius. He was a native of Gaul, and originally a slave. Of course his Latinity was bad, yet he acquired great reputation by his comedies. He died about A. A. C. 160, a few years after Ennius.

STATIUS (Publius Papinius), a celebrated Latin poet of the first century, born at Naples. He was the son of Statius, a native of Epirus, who went to Rome to teach poetry and eloquence, and had Domitian for his scholar. Statius the poet also obtained the favor and friendship of that prince; and dedicated to him his *Thebais* in twelve books, and *Achilles* in two. He died at Naples about the year 100. Besides the above poems there are also still extant his *Sylvæ*, in five books; the style of which is purer, more agreeable, and more natural, than that of his *Thebais* and *Achilles*.

STATOR, a surname of Jupiter, among the Romans, given him by Romulus, because he stopped their flight in a battle with the Sabines. Romulus built a temple to Jupiter Stator.—Liv. i. c. 12.

STATORES, in Roman antiquity, posts. See **POST**.

STATUARY (statuaire, Fr. vide statue). A sculptor. Although this latter word applies to the most elevated practisers of the art, which indeed derives its name therefrom, yet it seems desirable, even in common usage, to distinguish the sculptor who makes statues from him whose skill is chiefly displayed in architectural or other ornaments. The Latins used the word *statuarius* to designate the artist who made figures in bronze. In this sense it is employed by Pliny, who denominates the artist working in marble sculptor or *marmorum* sculptor. This distinction appears to be just. The author of a bronze statue is not a sculptor, but a modeller. Statuary, in its general sense, is the art of casting or carving statues. Phidias was the greatest statuary among the ancients, and Michael Angelo among the moderns.

STATUARY, a branch of sculpture, employed in the making of statues. See **SCULPTURE**, and **STATUE**. Statuary is one of those arts wherein the ancients surpassed the moderns; and indeed it was much more popular, and more cultivated, among the former than the latter. It is disputed between statuary and painting which of the two is the more difficult and the more artful.

STATUE, *n. s. & v. a.* } Fr. *statue*; Lat. *statua*, *n. s.* } *statua*. An image; solid representation of any living being: to place as a statue: a statuary is one who makes statues; also the art of making them.

The princess heard of her mother's *statue*, a piece many years in doing, and now newly performed by that rare Italian master. *Shakspeare. Winter's Tale.*

Thou shalt be worshipped, kissed, loved, and adored;

And, were there sense in his idolatry,
My substance should be *statued* in thy stead.

Shakspeare.

Architects propounded unto Alexander to cut the mountain Athos into the form of a *statue*, which in his right hand should hold a town capable of containing ten thousand men, and in his left a vessel to receive all the water that flowed from the mountain.

Wilkin's Mathematical Magick.

The northern nations, that overwhelmed it by their numbers, were too barbarous to preserve the remains of learning more carefully than they did those of architecture and *statuary*.

Temple.

A *statue* of Polycletus, called the rule, deserves that name for having so perfect an agreement in all its parts, that it is not possible to find a fault in it.

Dryden's Dufresnoy.

On other occasions the *statuaries* took their subjects from the poets.

Addison.

How shall any man, who hath a genius for history, undertake such a work with spirit and cheerfulness, when he considers that he will be read with pleasure but a very few years? This is like employing an excellent *statuary* to work upon mouldering stone.

Swift.

A *STATUE* is defined to be a piece of sculpture in full relievo, representing a human figure. Daviler more scientifically defines statue a representation, in high relievo and insulate, of some person distinguished by his birth, merit, or great actions, placed as an ornament in a fine building, or exposed in a public place, to preserve the memory of his worth. In Greece, one of the highest honors to which a citizen could aspire was to obtain a statue. Statues are formed with the chisel, of several matters, as stone, marble, plaster, &c. They are also cast of various kinds of metal, particularly gold, silver, brass, and lead. For the method of casting statues, see *FOUNDRY*. Statues are usually distinguished into four kinds: 1. Those less than the life; of which kind we have several statues of great men, of kings, and of gods themselves. 2. Those equal to the life; in which manner the ancients, at the public expense, used to make statues of persons eminent for virtue, learning, or the services they had done. 3. Those that exceed the life; among which those that surpassed the life once and a half were for kings and emperors; and those double the life for heroes. 4. Those that exceeded the life twice, thrice, and even more, and were called colossuses. See *COLOSSUS*. Every statue resembling the person whom it is intended to represent is called *statua iconica*. Statues acquire various other denominations. 1. Thus the allegorical statue is that which, under a human figure or other symbol, represents something of another kind; as a part of the earth, a season, age, element, temperament, hour, &c. 2. Curule statues are those which are represented in chariots drawn by bigæ or quadrigæ, that is, by two or four horses; of which kind there are several in the circuses, hippodromes, &c., or in cars, as we see some, with triumphal arches, on antique medals. 3. Equestrian statue, that which represents some illustrious person on horseback, as that famous one of Marcus Aurelius at Rome; that of king Charles I. at Charing-Cross; king George II. in Leicester Square, &c. 4. Greek

statue denotes a figure that is naked and antique; it being in this manner the Greeks represented their deities, athletæ of the Olympic games, and heroes; the statues of heroes were particularly called Achillean statues, by reason of the great number of figures of Achilles in most of the cities of Greece. 5. Hydraulic statue is any figure placed as an ornament of a fountain or grotto, or that does the office of a jet d'eau, a cock, spout, or the like, by any of its parts, or by any attribute it holds: the like is to be understood of any animal serving for the same use. 6. Pedestrian statue, a statue standing on foot; as that of king Charles II. in the Royal Exchange, and of king James II. in the Privy gardens. 7. Roman statue is an appellation given to such as are clothed, and which receive various names from their various dresses. Those of emperors with long gowns over their armour were called *statuæ paladutæ*; those of captains and cavaliers with coats of arms *thoracatæ*; those of soldiers with cuirasses *loricatæ*; those of senators and augurs *trabeatæ*; those of magistrates with long robes *togatæ*; those of the people with plain tunica *tunicatæ*; and lastly, those of women with long trains *stolatæ*. In repairing a statue cast in a mould they touch it up with a chisel, graver, or other instrument, to finish the places which have not come well off: they also clear off the barb, and what is redundant in the joints and projectures.

STATUE, in sculpture and statuary, a work of sculpture or modelling which represents the figure of a man or woman in full relief. The word is sometimes applied likewise to figures of animals executed in the same manner. In the most remote ages we find indications that several eastern nations possessed the art as well as practice of making and of erecting statues, but the Grecians were the first people who executed them skilfully. In the first place, the several heathen deities were represented by human figures, and after awhile the heroes of antiquity were also sculptured forth, and subsequently living characters of eminence, or such as had recently expired. These statues were erected in the public places to which the citizens generally resorted, to the end that the memory of the great men might be perpetuated. In the sequel, this particular taste became so widely spread that there was no other branch of the fine arts to which equal attention was paid.

In the early times of the republic, Rome possessed but a small number of statues of gods and distinguished men. After having, however, accomplished the conquest of Greece, and at different epochs transported from that country to Rome a great number of Grecian statues, the taste for this kind of performance became by degrees so ardent and general that, according to the expression of an ancient author, they were able to count at one particular period more statues in the imperial city than inhabitants! They did not content themselves with raising statues to deceased worthies, but awarded that honor to sundry living characters of merit. It was very customary among them to erect statues upon the tombs of their deceased patriots or chiefs; and such veneration was felt for the statues of their princes that the law prohibited a master from

punishing an offending slave who had sought refuge near the statue of an emperor. In the age of Tiberius it was a kind of crime to have merely changed a garment before his statues. The erection of statues of public men is by no means equally common in our days: but it is not the less important.

A statue, when it is intended to perpetuate the recollection of a man estimable for his patriotism or merit, should be placed in some conspicuous spot, where it would be most likely to attract the observation of the people. Mere resemblance of feature is by no means the only, or even the principal desideratum in a statue; it should display in a striking manner the elevation of soul, the grandeur of character, which might have rendered the object worthy of calling forth the exercise of the sculptor's chisel. Whether he might have been distinguished by probity and benevolence, or by intrepidity in the midst of dangers, or by any other elevated virtue, the expression of this should be preserved in the statue. Many of the statues of antiquity, which express the ideal of great characters, or of divinities, prove that the art of the sculptor is fully equal to this task. Indeed a considerable number of them are merely allegorical representations of various abstract qualities and properties. It is thus that Jupiter is the image of severe majesty joined to goodness; and Pallas that of the most consummate wisdom, &c. The general character of a man may be more justly gathered when he is in a state of repose than when agitated by any particular and transitory passion; and according to this theory it is fair to presume that a tranquil attitude is best adapted to express the prevailing character of the personage represented by a statue. This opinion, however, is to be received with some reservation, although the ancients will be found to have generally adopted it.

It will not, we suspect, be deemed a questionable affirmation that a fine statue is one of the most beautiful productions of genius and of art. The Greeks admired Phidias even more than any other of their illustrious men. The critical examination of a statue requires no inconsiderable portion of knowledge, taste, and skill. The first point to which the attention of the critic should be directed is the marble, from a careful scrutiny of which, the period when the statue was made may often be ascertained. For instance, the certainty that any given statue is of marble of Luna renders it evident that its age cannot be anterior to that of Augustus, since it was under that prince's reign the Luna quarries were discovered. The critic should proceed to take the exact measure of the statue; to describe its attitude; to indicate what restorations it might have undergone; to decide whether it is the representation of a divinity or hero, or simply of some distinguished ancient, &c. &c. It is also desirable that he should be acquainted with its history, traditional or otherwise, the authors who have mentioned it, the period of its discovery, the different prints engraved of it, &c.

The principal works in which the student will find representations of the most celebrated statues are the following:—J. B. Carollerii, *Antiquæ Statuæ*, Rome, 1585, fol. J. J. De Rubeis, In-

signiores Statuarum urbis Romæ Icones, Rome, 1645, 4to. Maffei, *Raccolta di Statue Antiche e Moderne*, Rome, 1707, fol. La Galeria Giustiniana.—*Vetera Monumenta quæ in hortis cœlimontanis et in œdibus Mattheorum adservantur*, 3 vols. fol. Rome, 1770—9. Zanetti, *Delle antiche Statue Greche e Romane che nell' Antisala della Libreria di San Marco, e in altri luoghi pubblici di Venezia si Trovano*, Venice, 1740, 2 vols. fol. Les Marbres de Dresde, by Le Plat, Dresden, 1733, fol. The first three vols. of Museo Pio Clementino, by Visconti. The third vol. of Museo Capitolinum. Le Musée Napoléon, by Piroli. La Villa Pinciana, and Monumenti Gabini. The Angusteum of M. Becker, &c. &c.

STATU QUO, or STATU QUO PRIUS, i. e. in the same state as before; an expression much used respecting treaties of peace, when all captures are restored, and every thing is put, or agreed to be put, on the same footing as before the war. This would answer extremely well if the lives of all the men murdered on both sides were also restored, without which there can be no real status quo.

STATURE, *n. s.* Fr. *stature*; Lat. *statura*. The height of any animal.

A creature who might erect
His *stature*, and upright with front serene
Govern the rest.

Milton.

What *stature* we attain at seven years we sometimes double, most times come short of at one and twenty.

Browne.

Foreign men of mighty *stature* came.

Dryden.

Thyself but dust, thy *stature* but a span;

A moment thy duration, foolish man!

Prior.

We have certain demonstration from Egyptian mummies, and Roman urns and rings, and measures and edifices, and many other antiquities, that human *stature* has not diminished for above two thousand years.

Bentley's *Sermos*.

STATUTE, *n. s.* } Fr. *statut*; Lat. *statu-*
STATUTABLE, *adj.* } *tum*. A law; edict of the legislature: statutable is according to statute.

Not only the common law, but also the *statutes* and acts of parliament, were specially intended for its benefit.

Spenser.

Blood hath been shed,
Ere human *statute* purged the general weal

Shakspeare.

There was a *statute* against vagabonds; wherein note the dislike the parliament had of gaoing them as chargeable and pesterous.

Bacon.

Know the *statutes* of heaven and laws of eternity, those immutable rules of justice.

Tillotson.

O queen! indulged by favour of the gods

To build a town, with *statutes* to restrain

The wild inhabitants beneath thy reign.

Dryden's *Æneid*.

I met with one who was three inches above five feet, the *statutable* measure of that club.

Addison's *Guardian*.

STATUTE more immediately signifies an act of parliament made by the three estates of the realm; and such statutes are either general, of which the courts at Westminster must take notice without pleading them; or they are special and private, which last must be pleaded.

STATUTE, STATUTUM, in English law, has divers significations: First, it signifies an act of parliament; and, secondly, it is a short writing

called a **STATUTE-MERCHANT**, or **STATUTE-STABLE** (see those articles), which are in the nature of bonds, &c., and called statutes, as they are made according to the form expressly provided in certain statutes.

The acts of parliament, statutes, or edicts, made by the king's majesty, by and with the advice and consent of the lords spiritual and temporal and commons in parliament assembled, compose the *leges scriptæ*, the written laws of the kingdom. The earliest statute of which any record exists is the statute of Gloster, 6. Edw. I., which is entered on a statute roll at the tower. There are six of these rolls, the latest containing the statutes of 12 Edw. IV. The previous statutes of Merton, 20 Hen. III. : Marleberge, 52 Hen. III., and Westminster the first, 3 Edw. I., are found in all printed collections, and in numerous ancient MSS. of the statutes. The general printed collections of the statutes are preceded by *Magna Charta*, 9 Hen. III., as confirmed and entered on the statute roll of 25 Edw. I., or the charter roll, 28 Edw. I., and that charter has now the force of a statute, and had such force, if not at the time of its being granted, certainly very soon after. The mode of making these statutes is stated under the title '**BILL BROUGHT INTO PARLIAMENT.**' To what is there said we may here only add, that the royal assent, when given, is written upon the several acts. That to the end of the third year of Henry VII. the statutes were entered of record in French or Latin: though the bills brought into parliament began to be in English in the time of Henry VI. By 33 Geo. III. c. 13, it is enacted that, when the operation of an act of parliament is not directed to commence from any time specified within it, the clerk of the parliaments shall indorse upon it the day upon which it receives the royal assent (and which, since this act, is added in the printed statutes immediately after the title): and that day shall be the date of its commencement.—This statute has obviated much inconvenience (not to say injustice) which arose from the former maxim, that an act of parliament operated from the first day of the session; the whole session, like the whole term, being considered as one day; and thus many statutes had the force of *ex post facto* laws.

By 48 Geo. III. c. 106, when bills for continuing temporary acts shall not pass before such acts expire, such acts shall be continued from the time of their expiration, except as to penalties, &c.

The method of citing these acts of parliament is various. Many of our ancient statutes are called after the name of the place where the parliament was held that made them; as the statutes of Merton and Marleberge (Marlborough), of Westminster, Gloucester, and Winchester. Others are denominated entirely from their subject; as the statutes of Wales and Ireland, the *Articula Cleri*, and the *Prærogativa Regis*. Some are distinguished by their initial words, a method of citing very ancient: as the statute of *Quia Emptores*, and that of *Circumspectè Agatis*. But the most usual method of citing them, especially since the time of Edward II., is by naming the year of the king's reign in which

the statute was made, together with the chapter or particular act, according to the numeral order. All the acts of one session of parliament taken together make properly but one statute: and therefore, when two sessions have been held in one year, we usually mention stat. 1, or stat. 2. Thus the bill of rights is cited, as 1 W. & M. stat. 2, c. 2; signifying that it is the second chapter or act, of the second statute (or the laws made in the second session of parliament), in the first year of king William and queen Mary.

These statutes, or acts of parliament, were anciently promulgated by means of exemplifications thereof under the great seal: which were sent to the sheriffs of the several counties, with writs requiring them to be published in such places of the county as the sheriffs thought fit. Writs of this nature appear annexed to the statutes on the statute rolls in the Tower from 6 Edward I. down to the reign of Henry V. Not very long after that time printing came into use, and then the statutes of each session were printed at the end of the session, and thus made known to the public; though proclamations were not entirely superseded in particular instances till a much later date. See the stat. 25 Hen. VIII. c. 22. The earliest sessional publications of statutes was that of the acts passed in the first and only parliament of Richard III. From that time until the year 1796 these sessional publications were the only mode of promulgation adopted; and these were not generally obtainable, except by private purchase, the delivery of them being confined to about 1100 copies (issued at the public cost) to the members of each house of parliament, the privy council, and some great officers of state. In consequence of several reports made by committees of the house of commons specially appointed to consider of the promulgation of the statutes, 5500 copies are now distributed throughout the United Kingdom of Great Britain and Ireland, to the houses of parliament, great officers and departments of state, public libraries, courts of justice, sheriffs, municipal magistrates, and clerks of the peace. By stat. 41 Geo. III. c. 90, it is enacted that the statutes printed by the king's printer, in Great Britain and Ireland respectively, shall be evidence of all such statutes prior to the union in 1801.

An edition of the Statutes of the Realm, from original records and authentic MSS., was undertaken in the year 1801, under the authority of the commissioners on the public records in Great Britain. The first volume, containing the statutes from 20 Henry III. to the end of the reign of Edward III., preceded by a complete collection of the *Charters of Liberties*, from Henry I. to Edward III., was published in 1811. The second volume, including the statutes from Richard II. to the end of Henry VII., appeared in 1816. These two volumes contain the whole of what may be termed the ancient part of the statute law.—A long Introduction with an appendix thereto, prefixed to the first volume, and the notes throughout that and the second volume, afford information, on the subject of statute law, not much known even to the best lawyers of the present day. The preface to the quarto edition of the statutes, published by the king's printer,

subsequent to the Union, and two prefaces prefixed to the first volume of the Collection of Statutes, in 10 vols. 4to., from Magna Charta to 1801, also published by the king's printer, will be found useful, with reference to the history of former printed editions of the statutes.—The authentic collection has been continued by the commissioners on the records, by subsequent volumes, to the reign of William III.; from which time the sessional collections printed by the king's printers are sufficiently accessible. Two volumes of the acts of parliament of Scotland have also been printed by the same commissioners. The commissioners on the records of Ireland are about in like manner to publish an authentic collection of the acts of the parliaments of Ireland.

STATUTE-MERCHANT, in law, is a bond of record acknowledged before the clerk of the statutes-merchant, and lord mayor of the city of London, or two merchants assigned for that purpose; and before the mayors of other cities and towns, or the bailiff of any borough, &c.; sealed with the seal of the debtor and the king; upon condition that, if the obligor pays not the debt at the day, execution may be awarded against his body, lands, and goods; and the obligee shall hold the lands to him, his heirs and assigns, till the debt is levied.—*Terms de la Ley*.

Estates by statute-merchant and statute-staple are classed by Blackstone among the species of estates defeasible on condition subsequent; and are said to be very nearly related to the *vivum vadium*, or estate held till the profits thereof shall discharge a debt liquidated or ascertained. For both the statute-merchant and statute-staple are securities for money; the one entered into before the chief magistrate of some trading town, pursuant to the stat. 13 Edw. I. stat. 3, *de mercatoribus*, and thence called a statute-merchant; the other pursuant to the stat. 27 Edw. III. c. 9. before the mayor of the staple, that is to say, the grand mart for the principal commodities or manufactures of the kingdom, formerly held by act of parliament in certain trading towns: whence this security is called a statute-staple. They are both securities for debts acknowledged to be due; and originally permitted only among traders, for the benefit of commerce; whereby not only the body of the debtor may be imprisoned, and his goods seized in satisfaction of the debt, but also his lands may be delivered to the creditor, till out of the rents and profits of them the debt may be satisfied. And, during such time as the creditor so holds the lands, he is tenant by statute-merchant or statute-staple. There is also a similar security, the recognizance, in the nature of a statute-staple acknowledged before either of the chief Justices, or (out of term) before their substitutes, the mayor of the staple at Westminster, and the recorder of London; whereby the benefit of this mercantile transaction is extended to all the king's subjects in general, by virtue of the stat. 23 Hen. VIII. c. 6 amended by stat. 8, Geo. I. c. 25; which direct such recognizances to be enrolled and certified into chancery. But these, by the statute of frauds, 29 Car. II. c. 3, are only binding upon the lands. in the hands of *bonâ fide*

purchasers, from the day of their enrolment, which is ordered to be marked on the record.—2 Comm. c. 10, p. 160.

These estates, though sometimes referred to in argument, seem now nearly unknown in practice; but as the law relating to them is in force, and as it may serve to elucidate other subjects by analogy, the following information on the subject has been preserved, as useful to the student, if not to the practitioner. The statute of Acton Burnel, 11 Ed. I. and stat. *de mercatoribus*, 13 Ed. I. stat. 3, enact, that the merchant shall cause his debtor to appear before the mayor of the city of London, or other city or town, and there acknowledge the debt, &c., by recognizance, which is to be enrolled; the roll whereof must be double, one part to remain with the mayor, and the other with the clerk appointed by the king; and then one of the clerks is to write the obligation, which shall be sealed with the debtor's seal, and that of the king, &c.

By these statutes, if the debt be not paid at the day upon the merchant's account, the mayor is to cause the debtor to be imprisoned, if to be found, and in prison to remain until he hath agreed the debt; and, if the debtor cannot be found, the mayor shall send the recognizance into the Chancery, whence a writ shall issue to the sheriff of the county where the debtor is, to arrest his body, and keep him in prison till he agree the debt; and, within a quarter of a year, his lands and goods shall be delivered to him to pay the debt; but, if the debtor do not satisfy the debt within that time, all his lands and goods shall be delivered to the merchant by a reasonable extent, to hold until the debt is levied thereby; and in the mean time he shall remain in prison; but, when the debt is satisfied, the body of the debtor is to be delivered together with his lands. If the sheriff return a *non est inventus*, &c., the merchant may have writs to all the sheriffs where he hath any land; and they shall deliver all the goods and lands of the debtor by extent; and the merchant shall be allowed his damage, and all reasonable costs, &c. All the lands in the hands of the debtor, at the time of the recognizance acknowledged, are chargeable (but see stat. 29 Car. II. c. 3, before referred to); though, after the debt is paid, they shall return to grantees, if they are granted away, as shall the rest to the debtor: the debtor or his sureties dying, the merchant shall not take the body of the heir, &c., but shall have his lands until the debt is levied. If the debtor have sureties, they shall be proceeded against in like manner as the debtor; but, so long as the debt may be levied of the goods of the debtor, the sureties are to be without damage. Also the merchant shall, besides the payment of his debt, be satisfied for his stay and detainer from his business. In London, out of the commonalty, two merchants are to be chosen and sworn by this statute, and the seal shall be opened before them, whereof one piece is to be delivered to the said merchants, and the other remain with the clerk; and before these merchants, &c., recognizances may be taken. A fee of *td.* per pound is allowed to the clerk for fixing the

king's seal; and a seal is to be provided that shall serve for fairs, &c.; but the statute extends not to Jews.—Cro. Car. 440, 457.

Statutes-merchant were contrived for the security of merchants only, to provide a speedy remedy to recover their debts; but at this day they are used by others who follow not merchandize, and are become one of the common assurances of the kingdom.—Bridg. 21: Owen 82. And all obligations made to the king are of the nature of these statutes-merchant.—12 Rep. 2, 3.

STATUTE-STAPLE is a bond of record, acknowledged before the mayor of the staple, in the presence of all or one of the constables; to this end, says the statute, there shall be a seal ordained, which shall be affixed to all obligations made on such recognizance acknowledged in the staple: this seal of the staple is the only seal the statute requires to attest this contract; but it is no more under the power or disposal of the mayor, than that appointed by the statute-merchant; for, though the statute appoints him the custody of it, yet it is in such a manner, that he cannot affix it to any obligation without their consent, it being to remain in the mayor's hands under the security of their own seals.—2 Roll. Abr. 466: stat. 27 Ed. III. c. 9.

To understand a little of the original and constitution of the staple, and the advantage the nation had by this establishment, we must observe that the place of residence, whither the merchants resorted with their staple commodities, was anciently called estaple, which signifies no more than mart or market: and this was formerly appointed out of the realm, as at Calais, Antwerp, &c., and other ports on the continent, which were nearest to us, and whither the merchants might with safety coast it. 4 Inst. 238. But, besides these staple ports appointed abroad, there were others appointed at home: whither all the staple commodities were carried in order to their exportation, such as London, Westminster, Hull, &c. This was found to be of great use and consequence to the prince in particular, and to the interest and credit of the nation in general; for at these staple ports were the king's customs easily collected, and were by the officers of the staple, at two several payments, returned into the exchequer; besides, at these staples, all merchants' goods were carefully viewed and marked by the proper officers of the staple; and this necessarily avoided the exportation of decayed goods, or ill-wrought manufactures, and consequently fixed a stamp of credit on the merchandizes exported, which, upon the view, always answered the expectation of the buyer.—Maline's Lex Merc. 337, 338.

The staple merchandizes, according to lord Coke, are only wool, woollens, leather, lead, and tin; others, butter, cheese, and cloths: but whatever they were, the mayor and constables had not only consuance of all contracts and debts relating to them, but they had likewise jurisdiction over the people, and all manner of things touching the staple. This power was given them, lest the merchants should be diverted and drawn from their business and trade, by applying to the common law, and running through the tedious forms of it, for a determina-

tion of their differences; and for the greater encouragement of merchants, that they might have all imaginable security in their contracts and dealings, and the most expeditious method of recovering their debts, without going out of the bounds of the staple.—4 Inst. 238. Maline's Lex. Mer. 337. By this it appears that this security was only designed for the merchants of the staple, and for debts only on the sale of merchandises brought thither; yet in time others began to apply it to their own ends, and the mayor and constable would take recognizances from strangers, surmising it was made for the payment of money for merchandises brought to the staple. To prevent this mischief, the parliament, in 23 Hen. VIII., reduced the statute-staple to its former channel, and laid a penalty of £40 on the mayor and constables who should extend the benefit of the statute to any but those of the staple. But though the stat. 23 Hen. VIII. c. 6 deprived them of this benefit, yet it framed the new sort of security known by the name of a recognizance, in the nature of a statute-staple; so called because this act limits and appoints the same process, execution, and advantage, in every particular, as is set down in the statute-staple.—Co. Litt. 290.

A recognizance, therefore, in nature of a statute-staple, as the words of the act declare, is the same with the former, only acknowledged under other persons; for, as the statute runs, the chief justice of the king's bench and common pleas, or, in their absence, out of term, the mayor of the staple, at Westminster, and the recorder of London, jointly together, shall have power to take recognizances for payment of debt in the form set down in the statute. In this, as in the former cases, the king appoints a seal to attest the contract.—Co. Litt. 290, a: 4 Inst. 238: 2 Roll. Abr. 466: Co. Ent. 12. Debt lies as well upon a statute-staple as upon a bond: and a statute acknowledged on lands is a present duty, and ought to be satisfied before an obligation; a debt due on an obligation being but a chose in action, and recoverable by law, and not a present duty by law, as a debt upon a statute, judgment, or recognizance is, upon which present execution is to be taken without farther suit.—Cro. Eliz. 355. 461. 494: 2 Lill. Abr. 536.

But a judgment in a court of record shall be preferred, in case of execution, before a statute: though if one acknowledge a statute, and afterwards confess judgment, if the land be extended thereon, the cognisee shall have a scire facias to avoid the extent upon the judgment. It is otherwise as to goods: for there, he that comes first shall be first served.—6 Rep. 45: 1 Brownl. 37. The cognisor of a statute grants his estate to the cognisee; by this the execution of the statute will be suspended.—2 Cro. 424. But if the cognisee, before execution of a statute, release to the cognisor all his right to the land, it will not be a discharge of the whole execution; for, notwithstanding, he may sue execution of his body and goods.—3 Shep. Abr. 326. Upon a statute-staple, a capias and extent of lands, goods, and chattels, are contained in one writ; but it is not so on a statute-merchant.—Jenk

Cent. 163. In chancery, the proceedings on a statute-staple are in the petty-bag office; and statutes-staple are suable in the king's bench or common pleas, as well as in chancery.—Cro. Eliz. 208. Chancery will give relief against an infant in case of a statute-staple, though it is not extendible against him at law.—1 Lev. 198. On a statute's being satisfied, it is to be vacated by entering satisfaction, &c. Statutes-staple and statutes-merchant are to be entered within six months, or shall not be good against purchasers.—Stat. 27 Eliz. c. 4.—See stat. 16 & 17 Car. II. c. 5, for preventing delays and extending statutes.

He that is in possession of lands on a statute-merchant, or staple, is called tenant by statute-merchant, or statute-staple, during the time of his possession: and creditors shall have freehold in the lands of debtors, and recovery by novel disseisin, if put out; but if tenant by statute-merchant or statute-staple hold over his term, he that hath right may sue out a venire facias ad computand, or enter, as upon an elegit.—Stat. 27 Edw. III. c. 9.

STAUBBACH, a celebrated cataract of Switzerland, in the canton of Bern, near Lauterbrunnen, which rushes down a precipice 930 feet high with the most tremendous impetuosity and noise, dispersing the water in a grand spray, and occasioning a kind of tempest by the agitation of the air. The brook from which this torrent rises is named Kupfer Bachlein, or Rivulet of copper.

STAVE, *v. a. & v. n.* From staff, in the plural staves. To break in pieces: used originally of barrels made of small parts or staves: to push off; to furnish with staves: as a verb neuter (obsolete) to fight with staves.

The seared disorders that might ensue thereof have been an occasion that divers times all the wine in the city hath been *staved*.

Sandys's Travels.

This was the shameful end of Aloysus Grittus, Solyman's deputy in Hungary; who, climbing too fast up the evil *staved* ladder of ambition, suddenly fell, and never rose more.

Knolles.

How can they escape the contagion of the writings, whom the virulency of the calumnies have not *staved* off from reading?

Ben Jonson.

Equal shame and envy stirred
I' the enemy, that one should beard
So many warriors, and so stout,
As he had done, and *staved* it out.

Hudibras.

If an irreverent expression, or a thought too wanton, are crept into my verses, let them be *staved* or forfeited like contrabanded goods.

Dryden.

The condition of a servant *staves* him off to a distance; but the gospel speaks nothing but allure-ment, attraction, and invitation.

South.

STAVELEY (Thomas), esq., a learned English writer, born at Cussington, in Leicestershire, and educated at Cambridge. He entered councillor in 1654. In 1664 he published the *Romish Horse Leech*, and the *History of Churches*. He died in 1683.

STAVEREN, a town of Holland, and the most ancient of Friesland, supposed to have been built one year before the commencement of the Christian era, and to have taken its name from an ancient idol, worshipped by the inhabitants called Stavon. Great part of the ancient town having been destroyed by the sea, the inhabitants rebuilt it in the place where it now

stands, as being less exposed. It was anciently a very rich, powerful, and populous city, with the best harbour in that country. The ancient kings of Friesland made it their ordinary residence, in a palace built by Richolde, the first king, about the year 400. Radbode VI., after he had conquered all the country as far as Utrecht, called his conquests the kingdom of Staveren, which shows the flourishing state of the town at that time, and was the occasion of its being included in the league of the German Hanse towns. It was surrounded with walls and ditches, about the year 339, by Obidalde VI., duke of Friesland. It is since reduced very much from its ancient grandeur, the harbour being choaked up; however there remains enough of its former splendor to make it a considerable town; and they still carry on some trade, especially in fishing, and in passage boats over the pools and lakes of the neighbourhood. In 1799 the town was taken by a British fleet; forty miles north of Amsterdam. Lat. 52° 56' N., long. 5° 16' E.

STAUNTON (sir George Leonard), bart., a modern traveller, was a native of the county of Galway in Ireland. He was destined for the medical profession, with a view to which he studied at Montpellier, and took the degree of M.D. About 1762 he established himself in practice in the island of Grenada in the West Indies, where he obtained the patronage of lord Macartney, who made him his secretary; and he likewise held the office of attorney-general, till the taking of that island by the French. His lordship, being appointed governor of Madras, took Mr. Staunton with him to the East Indies, where he was employed in the arrest of general Stuart, who had opposed the authority of the governor. He also induced the French admiral Suffren to suspend hostilities before Godelour; and negotiated a treaty with Tippoo Saib. Returning to England, the East India Company repaid his services with a pension of £500. a-year, the king created him a baronet, and the university of Oxford bestowed on him the diploma of LL.D. When lord Macartney went as ambassador to China, sir George accompanied him as secretary, with the provisional title of envoy extraordinary and minister plenipotentiary. Of that mission and of the empire and people of China he published an account in 1797, 2 vols. 4to., which was translated into French and German. He died in London January 1801.

STAUNTON, a principal branch of the Roanoke, Virginia, rises on the west side of the Blue Ridge, and has the name of Roanoke, but after its passage through the Blue Ridge it takes that of Staunton, which it retains to its junction with the Dan, on the west border of Mecklenburg county. After the junction it resumes the name of Roanoke.

STAULOLITE, in mineralogy, grenatite, or prismatic garnet.

STAULOTIDE, grenatite, prismatic garnet, or staurolite. Color dark reddish-brown. Only crystallised in forms which may be reduced to a prism of 129° 30'. The following are secondary forms:—a very oblique four-sided prism,

truncated on the acuter lateral edges, forming an unequiangular six-sided prism; the same acutely bevelled on the extremities; and a twin crystal, formed by two perfect six-sided prisms. Splendent, resino-vitreous. Cleavage in the smaller diagonal. Fracture small-grained uneven. Opaque, or translucent. Scratches quartz feebly. Brittle. Specific gravity 3·3 to 3·8. Infusible. Its constituents are, alumina 44, silica 33, lime 3·84, oxide of iron 13, oxide of manganese 1, loss 5·16.—Vauquelin. The geognostic relations of this mineral are nearly the same with those of precious garnet. It occurs in clay-slate near Ardonald, between Keith and Huntly, in Aberdeenshire; and in a micaceous rock at the Glenmalur lead-mines in the county of Wicklow, Ireland.

STAY, *v. n., v. a., & n. s.* } Belg. *staen* ;
 STAY'ED, *adj.* } Dan. *stae*. To
 STAY'EDLY, *adv.* } continue in a
 STAY'EDNESS, *n. s.* } place or state;
 STAY'ER, } forbear departure,
 STAY'LACE, } or motion; stop;
 STAYS, *plu.* } dwell; belong: as

a verb active to repress; withhold; obstruct; delay; hold in place; hold up: as a noun substantive, stand; continuance; obstruction; restraint; a fixed state; prop; support: stayed means settled; fixed; sedate: the adverb and noun substantive following corresponding: a stayer is one who stops, holds, or supports: staylace, the lace of the female stays, a kind of boddice, or waistcoat.

Aaron and Hur *stayed* up his hands, the one on the one side, and the other on the other.

Exod. xvii. 12.

Would ye tarry for them 'till they were grown? would ye *stay* for them from having husbands?

Ruth i. 13.

Because ye trust in oppression, and *stay* thereon, this shall be as a breach ready to fall. *Isa. xxx. 12.*

They call themselves of the holy city, and *stay* themselves upon God.

Id. xlvi. 2.

They were come upon the *stays*, when one of the sailors descried a galley.

message requires. *Swift.*

A *stayface* from England should become a topic
for censure at visits. *Id.*

May Jove, the guardian of the capitol,
He, the greater *stayer* of our troops in rout,
Fulfil your hopes, and animate the cohorts.
A. Philips.

STAY, a large strong rope employed to sup-
port the mast on the fore part, by extending from
its upper end towards the fore part of the ship,
as the shrouds are extended to the right and left,
and behind it. See **MAST**, **RIGGING**, and
SHROUD. The stay of the fore-mast is called the
fore-stay, and reaches from the mast-head toward
the bowsprit end: the main stay extends over
the forecastle to the ship's stem; and the mizen-
stay is stretched down to that part of the main-
mast which lies immediately above the quarter-
deck: the fore-top-mast stay comes also to the
end of the bowsprit, a little beyond the fore-stay:
the main-top-mast is attached to the head or
hounds of the fore-mast: and the mizen-top-
mast stay comes also to the hounds of the main
mast; the fore-top-gallant stay comes to the
outer end of the jib-boom; and the main-top-
gallant stay is extended to the head of the fore-
top mast.

STAY SAIL, a sort of triangular sail extended
upon a stay. See **SAIL**.

STAYNER (sir Richard), was the gallant
commander of a ship of war during the protec-
torate; and, in conjunction with captain Smith,
took a Dutch East India ship of 800 tons bur-
den, having on board four chests of silver. In
1656 he was appointed to the command of three
frigates, and with this squadron fell in with the
Spanish flotilla, consisting of eight sail, of which
he captured two, burnt one, sunk another, and
drove two on shore. The treasure captured on
this occasion amounted to £600,000 sterling, so
that Stayner returned to England crowned with
glory, and laden with wealth. In the following
year he sailed with the fleet, under the command
of Blake, for the purpose of intercepting the
Spanish West India fleet, which had taken shel-
ter in the bay of Santa Cruz. On reconnoitering
the position of the enemy, the English admiral
found it impossible to bring off his ships, though
he thought they might be destroyed. Stayner was
immediately detached to begin the attack, and,
being supported by Blake with the remainder of
the fleet, the Spaniards were, in a very few hours,
driven out of their ships and breast-works. The
former were instantly taken possession of by the
English, and, as they could not be brought off,
they were all set on fire, and burnt to the water's
edge. 'The whole action,' says Clarendon, 'was
so miraculous, that all men, who knew the place
wondered that any sober men, with whatever
courage' endowed, would ever have undertaken
it; and they could hardly persuade themselves
to believe what they had done! while the Spa-
niards comforted themselves with the belief that
they were devils, and not men, who had des-
troyed them in such a manner.' Cromwell
thought so highly of the conduct of captain
Stayner, that he immediately conferred on him
the honor of knighthood. On the restoration,
sir Richard Stayner had a command under Mon-
tague, afterwards the earl of Sandwich, was
again knighted, and was constituted rear-admiral
of the fleet. He first hoisted his flag in the

Swiftsure, and afterwards in the Mary. After this, the nation being at peace, no opportunity was offered to this brave man of adding to those services which he had already rendered his country; and it is thought he died very soon after.—Campbell's Lives of the Admirals, vol. iv.

STEAD, *n. s. & v. a.* } Sax. ræð ; Goth. }
 STEAD'FAST, *adj.* } *stod.* Place; room; }
 STEAD'FASTLY, *adv.* } position; support; }
 STEAD'FASTNESS, *n. s.* } (hence the wooden }
 STEAD'ILY, *adv.* } frame that supports a }
 STEAD'INESS, *n. s.* } bed;) aid: to fill the }
 STEAD'Y, *adj.* } place of another; aid; }

help; support: steadfast is firm; fixed fast in place: hence firm of character; constant; resolute: steady is also firm; fixed; regular; constant: the respective adverbs and noun substantives corresponding.

There fell down many slain, and they dwelt in their *steads* until the captivity. 1 Chron. v. 22.

Be faithful to thy neighbour in his poverty; abide *steadfast* unto him in the time of his trouble.

Eccles. xxii. 23.

Him resist, *steadfast* in the faith. 1 Peter v. 9.
 Their feet *steady*, their hands diligent, their eyes watchful, and their hearts resolute. Sidney.

We are neither in skill, nor ability of power, greatly to *stead* you. Id.

Such was this giant's fall, that seemed to shake This *steadfast* globe of earth, as it for fear did quake. Spenser.

So hard these heavenly beauties be enfired, As things divine, least passions do impress,

The more of *steadfast* minds to be admired,
 The more they stayed be on *steadfastness*. Id.

I hope her stubborn heart to bend,
 And that it then more *steadfast* would endure. Id.

Fly, therefore, fly this fearful *stead* anon,
 Lest thy fool hardize work thee sad confusion. Id.

The term of life is limited,
 Ne may a man prolong nor shorten it;

The soldier may not move from watchful *stead*,
 Nor leave his stand until his captain bed. Id.

They nigh approached to the *stead*
 Where as those mairmaids dwelt. Id. Faerie Queene.

Laws ought to be like stony tables, plain, *steadfast*, and immoveable. Id. State of Ireland.

If we had taken them clean away, or else removed them, so as to place in their *stead* others, we had done worse. Hooker.

A complete man hath some parts whereof the want could not deprive him of his essence; yet to have them standeth him in singular *stead* in respect of special uses. Id.

It nothing *steads* us
 To chide him from our eyes. Id.

Rich garments, lineens, stuffs, and necessities,
 Which since have *steaded*. Id. Tempest.

Can you so *stead* me
 As bring me to the sight of Isabella? Shakespeare.

We shall advise this wronged maid to *stead* up your appointment, and go in your place. Id.

He sails 'tween worlds and worlds with *steady* wing. Milton.

Now clear I understand
 What oft my *steadiest* thoughts have searched in vain. Id.

Nor do the boldest attempts bring forth
 Events still equal to their worth;

But sometimes fail, and in their *stead*
 Fortune and cowardice succeed. Butler.

Jealousy then fired his soul,
 And his face kindled like a burning coal;
 Now cold despair succeeding in her *stead*,
 To livid paleness turns the glowing red. Dryden.

The genial bed,
 Sallow the feet, the borders, and the *sted*. Id.

What form of death could him affright,
 Who, unconcerned, with *steadfast* sight
 Could view the surges mounting steep,
 And monsters rolling in the deep? Id.

Steady to my principles and not dispirited with my afflictions, I have, by the blessing of God, overcome all difficulties. Id. Æneid.

Steadiness is a point of prudence as well as of courage. L'Estrange.

A clear sight keeps the understanding *steady*. Locke.

He makes his understanding the warehouse of lumber rather than a repository of truth, which will stand him in *stead* when he has occasion for it. Id.

Sin has a tendency to bring men under evils, unless hindered by some accident, which no man can *steadily* build upon. South's Sermons.

God's omniscience *steadfastly* grasps the greatest and most slippery uncertainties. Id.

Your friendly aid and counsel much may *stead* me. Rowe.

A friend is useful to form an undertaking, and secure *steadiness* of conduct. Collier of Friendship.

How reverend is the face of this tall pile,
 Whose massy pillars rear their aged heads
 To bear aloft its arched and ponderous roof,
 By its own weight made *steadfast* and immoveable,
 Looking tranquillity! it strikes an awe
 And terror on my aking sight. Congreve.

So *steadily* does fickle fortune steer
 The' obedient orb that it should never err. Blackmore.

The smallest act of charity shall stand us in great *stead*. Atterbury's Sermons.

John got the better of his choleric temper, and wrought himself up to a great *steadiness* of mind, to pursue his interest through all impediments. Arbuthnot.

In general, *steadfastly* believe that whatever God hath revealed is infallibly true. Wake's Preparation for Death.

Steer the bounding bark with *steady* toil,
 When the storm thickens and the billows boil. Pope.

STEAK, *n. s.* Isl. and Erse. *styck*, a piece; Swed. *steka*, to boil. A slice of flesh broiled or fried; a collop.

The surgeon protested he had cured him very well, and offered to eat the first *stake* of him. Tatler.

Fair ladies who contrive
 To feast on ale and *stakes*. Swift.

STEAL, *v. a. & v. n.* } Pret. I stole; part. }
 STEAL'ER, *n. s.* } *pass.* stolen; Saxon }
 STEAL'INGLY, *adv.* } *relan*; Belg. *stelen*; }
 STEALTH. } Goth. *stela*. To take }
 by theft; take clandestinely, slyly, or without right: the derivatives corresponding.

How should we *steal* silver or gold? Gen. xlv. 8.

Stolen waters are sweet, and bread eaten in secret is pleasant. Prov. ix. 17.

Fixt of mind to avoid further entreaty, and to fly all company, one night she *stole* away. Sidney.

They were divers motions, they did so *stealingly* slip one into another, as the latter part was ever in hand before the eye could discern the former was ended. Id.

On his back a heavy load he bare
Of nightly *stealths*, and pillage several.

Faerie Queene.

In the secret dark that none reproves,
Their pretty *stealths* shall work, and snares shall
spread.

Spenser.

The law of England never was properly applied
to the Irish, by a purposed plot of government, but
as they could insinuate and *steal* themselves under
the same by their humble carriage and submission.

Id.

The owner proveth the *stealth* to have been com-
mitted upon him by such an outlaw, and to have been
found in the possession of the prisoner.

Id. Spirit of Ireland.

The wisdom of the same spirit borrowed from
melody that pleasure, which, mingled with heavenly
mysteries, causeth the smoothness and softness of
that, which toucheth the ear, to convey, as it were
by *stealth*, the pleasure of good things into man's
mind.

Hooker.

Young Lorenzo

Stole her soul with many vows of faith,
And ne'er a true one.

Shakspeare.

Were it not that my fellow schoolmaster
Doth watch Bianca's steps so narrowly,
'Twere good to *steal* our marriage.

Id.

Let's shift away; there's warrant in that theft,
Which *steals* itself when there's no mercy left.

Id.

The transgression is in the *stealer*.
A schoolboy, finding a bird's nest, shews it his
companion, and he *steals* it.

Id.

Now withered murder, with his *stealthy* pace,
Moves like a ghost.

Id. Macbeth.

Thou ran'st a tilt in honour of my love,
And *stol'st* away the ladies' hearts of France.

Shakspeare.

There are some shrewd contents in yon same
paper,

That *steal* the color from Bassanio's cheek;
Some dear friend dead.

My lord of Amiens and myself
Did *steal* behind him as he lay along
Under an oak.

Shakspeare.

I cannot think it,
That he would *steal* away so guilty like,
Secing you coming.

Id. Othello.

The most peaceable way, if you take a thief, is to
let him shew what he is, and *steal* out of your com-
pany.

Shakspeare.

At time that lovers' flights doth still conceal,
Through Athen's gate have we devised to *steal*.

In my conduct shall your ladies come,
From whom you now must *steal* and take no leave.

Id.

The good humour is to *steal* at a minute's rest.
—Convey, the wise it call; *steal!* a ficio for the
phrase!

Id.

I feel this youth's perfections,
With an invisible and subtle *stealth*,
To creep in at mine eyes.

Id. Twelfth Night.

The *stealth* of mutual entertainment
With character too gross is written on Juliet.

Shakspeare.

Others, weary of the long journey, lingering be-
hind were *stolen* away; and they which were left,
moiled with dirt and mire.

Knolles.

The vapour of charcoal hath killed many; and it
is the more dangerous, because it cometh without any
ill smell, and *stealeth* on by little and little.

Bacon's Natural History.

The gods persuaded Mercury,
Their good observer, to this *stealth*.

Chapman's Iliad.

Store of cabins are but sluttish dens, that breed
sickness in peace, serving to cover *stealths*, and in
fight are dangerous to tear men with splinters.

Raleigh.

A bride
Should vanish from her clothes into her bed,
As souls from bodies *steal*, and are not spied.

Donne.

A soft and solemn breathing sound
Rose like a stream of rich distilled perfumes
And *stole* upon the air, that even silence
Was took ere she was ware.

Milton.

The monarch blinded with desire of wealth,
With steel invades his brother's life by *stealth*
Before the sacred altar.

Dryden.

As wise artists mix their colours so,
That by degrees they from each other go;
Black *steals* unheeded from the neighbouring white,
So on us *stole* our blessed change.

Id.

Stealing is the taking from another what is his,
without his knowledge or allowance.

Locke.

They hate being alone, for fear some affrighting
apprehensions should *steal*-or force their way in.

Calamy.

Now his fierce eyes with sparkling fury glow;
Now sighs *steal* out, and tears begin to flow.

Pope.

Let humble Allen, with an awkward shame,
Do good by *stealth*, and blush to find it fame.

Id.

A factor *stole* a gem away.

Id.

At a time when he had no steward, he *stole* away.

Swift.

Variety of objects has a tendency to *steal* away
the mind from its steady pursuit of any subject.

Watts.

STEAM, *n. s.* Sax. *stæme*. The smoke or
vapor of any thing moist and hot. See below.

Scarcely had Phœbus in the gloomy east

Got harnessed his fiery-footed team,

Ne reared above the earth his flaming crest

When the last deadly smoke aloft did *steam*.

Spenser.

Sweet odours are, in such company as there is
steam and heat, things of great refreshment.

Bacon.

His offering soon propitious fire from heaven
Consumed, with nimble glance and grateful *steam*.

Milton.

Ye mists that rise from *steaming* lake.

Id.

The dissolved amber plainly swam like a thin film
upon the liquor, whence it *steamed* away into the air.

Boyle.

Let the crude humours dance

In heated brass, *steaming* with fire intense.

Philips.

While the temple smoked with hallowed *steam*,

They wash the virgin.

Dryden.

See! see! my brother's ghost hangs hovering
there

O'er his warm blood, that *steams* into the air.

Id.

O wretched we! Why were we hurried down

This lubrick and adulterate age;

Nay, added fat pollutions of our own,

To increase the *steaming* odours of the stage?

Id.

Such the figure of a feast,

Which, were it not for plenty and for *steam*,

Might be resembled to a sick man's dream.

King.

Some it bears in *steams* up into the air, in such a
quantity as to be manifest to the smell, especially the
sulphur.

Woodward.

These minerals not only issue out at these larger
exits, but *steam* forth through the pores of the earth,
occasioning sulphureous and other offensive stench.

Id.

S T E A M E N G I N E .

1. **STEAM ENGINE.** Steam may justly be considered as the most important prime mover that the ingenuity of man has yet devised, and its utility to a commercial country like Great Britain must be sufficiently obvious. It has enabled us to support a proud superiority both in arts and manufactures, and, from the commercial advantages that have resulted, it has enabled us to fight the battles of freedom in every quarter of the globe.

2. Prior to entering into a detailed history of the steam engine, it may be advisable to furnish our readers with a brief view of the various prime movers that have been employed prior to the invention of this stupendous machine, and we shall thus be the better enabled to form an accurate estimate of its importance. We cannot better do this than by a reference to the introductory portion of Partington's Treatise on the Steam Engine.

3. From the most accurate observations it appears that the physical powers of the human race differ very widely, not only in various individuals, but also in different climates; the value of a *r*an therefore, as a working machine, will not be so great beneath the torrid zone as in the more temperate climate of Europe. This will serve to illustrate the great advantage which our colonists, particularly in the West Indies, would derive from the more general employment of inanimate force; the day labor of a negro in the sugar countries amounting to little more than one-third of that performed by a European mechanic.

4. A laborer, working ten hours per day, can raise in one minute a weight equivalent to 3750 pounds one foot high, or about sixty cubic feet of water in the same time; while the power of a horse, working eight hours per day, may be correctly averaged at 20,000 lbs. Smeaton states that this animal, by means of pumps, can raise 250 hogsheads of water ten feet high in an hour. It is a well known fact also that men, when trained to running, are able on the average of several days being taken, to outstrip the fleetest horse; and yet it will be seen from the above statement that his force, if properly applied, is at least six times that of the most powerful man.

5. The use of water as an impelling power, both for the turning of machinery and other purposes connected with the useful arts, appears to have been known at a very early period. Vitruvius describes a variety of machines for this purpose, the earliest of which were employed merely to raise a portion of the fluid by which they were impelled. The most simple method of applying this element as a mechanical agent evidently consisted in the construction of a wheel, the periphery of which was composed of a number of float-boards. This, on being exposed to the action of a running stream, was afterwards employed to give motion to a variety of mills, and is at the present time employed in almost every species of machinery.

6. Among the most celebrated hydraulic ma-

chines we may enumerate the machine of Marly. This, when first constructed, appears to have produced one-eighth of the power expended, so that seven-eighths of its power were usually lost. This misapplied power has been injurious to the engine; and the wear it has occasioned has reduced the mechanical effect very materially. But this may be considered as an extreme case, and we select it merely as an instance of that total ignorance of the first principles of mechanics which characterised some foreign engineers of the last century.

7. It may, however, be advisable to examine the ratio of power expended in comparison with that of the effect produced in some of the most simple hydraulic machines; and, by this calculation, the amount of friction, &c., may be accurately ascertained.

	Power.	Effect.
Undershot water wheel	9	= 3
Overshot do.	10	= 8
Hydraulic ram. (This machine will make from twenty to 100 strokes per minute).	10	= 6
Large machine at Chremnitz (each stroke occupying about three minutes).	9	= 3

8. But the water-mill, which is the usual machine employed, even in its most improved form, is far from being beneficial either to the agriculturist or the manufacturer. The former is injured by the laws which prohibit the draining of mill-streams for the purposes of irrigation, by which much improvement is kept back that would otherwise take place; while the health of the latter, in the immediate neighbourhood of manufacturing districts, is much injured by the stagnant condition of the water which is thus unnecessarily dammed up.

9. Wind, which we may consider as the next substitute for animal power, appears to have been first employed to give motion to machinery in the beginning of the sixth century. The use of this species of mechanical force is, however, principally limited to the grinding of corn, the pressing of seed, and other simple manipulations; the great irregularity of this element precluding its application to those processes which require a continued motion.

10. A windmill with four sails, measuring seventy feet from the extremity of one sail to that of the opposite one, each being six feet and a half in width, is capable of raising 926 pounds 232 feet in a minute; and of working on an average eight hours per day. This is equivalent to the work of thirty-four men; twenty-five square feet of canvas performing the average work of a day laborer. A mill of this magnitude seldom requires the attention of more than two men; and it will thus be seen that, making allowance for its irregularity, wind possesses a decided superiority over every species of animal labor.

11. To show, however, the great advantage which the steam engine, even in its rudest state, possesses over mere pneumatic or hydraulic ma-

chinery, we will now examine its effective force when employed in the working of pumps. It has been already stated that the machine of Marly, formerly considered the most powerful engine in the world, when first erected lost seven-eighths of its power from friction, and other causes; while the over-shot water-wheel, which can act only in favorable situations, produces nearly eight-tenths of the force employed. Now it is stated by Dr. Desaguliers that the atmospheric engine working at Griff-mine, nearly a century back, produced full two-thirds of effective force for the power employed; and this too at a comparatively moderate expense. We find, farther, that a hundred weight of coals burned in an engine on the old construction would raise at least 20,000 cubic feet of water twenty-four feet high; an engine with a twenty-four inch cylinder doing the work of seventy-four horses. From this it will be seen that a bushel of coals is equal to two horses, and that every inch of the cylinder performs nearly the work of a man.

12. An engine upon captain Savery's plan, constructed by Mr. Keir, has been found to raise nearly 3,000,000 lbs. of water one foot high with a single bushel of coals; while the best engine on Newcomen's principle will raise 10,000,000, and Mr. Watt's engine upwards of 30,000,000 lbs., the same height. If we add to the advantage gained by the employment of so cheap a prime mover, the vast concentration of force thus brought into immediate action, its value may easily be appreciated.

13. One of the largest engines yet constructed is now in action at the united mine in Cornwall; it raises 80,000 lbs. 100 feet high per minute; and to effect this enormous labor it only requires about thirty pounds of coal for the same period of time.

14. To the mining interests this valuable present of science to the arts has been peculiarly acceptable; as a large portion of our now most productive mineral districts must long ere this have been abandoned had not the steam engine been employed as an active auxiliary in those stupendous works. In the draining of fens and marsh lands this machine is in the highest degree valuable; and, in England particularly, it might be rendered still more generally useful. In practice it has been ascertained that an engine of six horse power will drain more than 8000 acres, raising the water six feet in height; while the cost of erection for an engine for this species of work, including the pumps, will not exceed £700. This is more than ten windmills can perform, at an annual expenditure of several hundred pounds; while, in the former case, the outgoings will not exceed £150 per annum.

15. To the mariner, also, the steam engine offers advantages of a no less important and novel nature than those we have already described. By its use he is enabled to traverse the waters, both against wind and tide, with nearly as much certainty, and, as the machinery is now constructed, with much less danger, than by the most eligible road conveyance.

16. The generation of steam forms a most important part of the subject under consideration. Indeed the whole power of the steam engine depends on the formation of elastic vapor produced

from water varying in temperature from 212° of Fahrenheit's thermometer to about 300° of the same scale. This matter has been admirably discussed in the unfinished work by Dr. Birkbeck and Mr. Adcock, to whose pages we must now direct our readers' attention, as it contains a most masterly dissertation on the formation of steam.

17. Aqueous vapor, in its perfect state, is transparent and colorless, consequently invisible. We are chiefly accustomed to attend to it, when having partially mingled with the air, or having touched substances cooler than itself, it has become vesicular, and consequently visible. The moist white vapor, therefore, composed of an infinite number of vesicles or small globules, is not, as generally supposed, perfect steam, but steam which has been robbed of a portion of caloric. The consequence of this abstraction of caloric is the loss of the gaseous or elastic form, and is quickly followed by a complete restitution of the state of inelastic fluidity. The facility and suddenness, indeed, with which condensation, as this change is denominated, may be effected by different refrigerating means, is a property not less remarkable or important than elasticity, the energetic property which we have already mentioned.

18. Water exposed in an open vessel to the action of fire cannot, however great the heat applied, be made to indicate a higher temperature than that which first produces ebullition. Steam will be evolved in greater or less abundance, according to the heat applied, but throughout the process its temperature will continue the same as that of the water. Dr. Hooke directed public attention to this fact; but to Dr. Black is due the honor of having first minutely investigated the whole phenomenon. He discovered that, during the conversion of ice into water, a greater quantity of caloric disappeared than was indicated by the thermometer; therefore, reasoning from analogy, he was led to conclude that, as the difference between a liquid and a solid is ascribable to the fixation of caloric, so, most probably, an elastic fluid, such as steam, differs from a liquid, such as water, in consequence of the operation of the same cause. In endeavouring to ascertain this point, he compared the time of raising the temperature of a liquid a certain number of degrees with the time of evaporating it by the same influx of external heat, and found that the caloric existing in a latent state in steam which balances the pressure of the atmosphere was not less than 800°. Subsequent experiments performed by other philosophers seem to prove that the heat which disappears is here stated too low: but it must be confessed that the results of the experiments on this interesting subject exhibit great discrepancies.

Latent Heat of Aqueous Vapor.

	Fahrenheit.
Black	800°
Ure	888
Southern	945
Watt	950
Clement	990
Lavoisier	1000
Thompson	1016
Rumford	1021

19. Considering that the caloric producing these important changes was not immediately discoverable by the thermometer or the senses, Dr. Black gave it the name of latent heat. Subsequently it has been termed by Professor Pictet, with more propriety, caloric of fluidity, and caloric of vaporisation.

20. From the well-known ability and long experience of the late James Watt, we ought to conclude that the result of his experiments approaches very near the truth; more especially as it coincides with that of Southern, who in practical dexterity was very little, if at all, inferior to his highly ingenious and scientific friend.

21. It was in the course of the year 1781 that Mr. Watt tried experimentally to ascertain this point. He obtained a pipe of copper, one-fiftieth of an inch thick, five feet long, and five-eighths of an inch diameter in the bore, and, having bent the extremities in contrary directions, fixed one end steam-tight on the spout of a tea-kettle, from which the pipe inclined upwards, so that the other end was about two feet higher than the spout. In the upper end was fitted a piece of cork, having a hole about two-tenths of an inch diameter, and a small piece of quill introduced to keep the perforation open. The kettle was filled with water half way up the spout, and the lid, being made tight with a proper lute, was securely held down by a piece of wood, reaching from the top of the centre of the lid to the under side of the handle. It was placed over a fire and made to boil, and care was taken to allow the steam to escape, until such portion of it as condensed, no longer dropped from the end of the tube but returned by the inclined part into the kettle. A tin pan, four inches deep and six inches in diameter, was supplied with two pounds and a half avoirdupois of water, then weighed with great accuracy, and placed on several folds of flannel on a stand. This stand was made of sufficient height to allow the extremity of the cork in the upper end of the tube to be immersed in the water in the pan. The water was nearly two inches and a half deep. A disk of strong paper, coated with linseed oil and dried, was fitted to the inside of the pan; and it was again accurately weighed.

22. When the end of the tube was immersed in the cold water of the pan, the steam issuing

from it was condensed with a crackling noise, and the water became heated. The water was constantly stirred, that the heat might be equally distributed, and the experiment was continued until the water had acquired from 70° to 90° of heat, which was generally in from four to six minutes. Afterwards the pan was covered with a disk of oiled paper, to prevent evaporation, which would have lessened the weight during the operation of weighing. The heat of the room, during the experiments, was generally about 56°.

23. Having so far completed the preparation, it became necessary, in order to obtain the greatest possible accuracy, to learn what quantity of heat had been absorbed by the pan. It was therefore made quite dry, and placed in a room of the temperature 40°; and in about half an hour, when it was supposed to have acquired the heat of the place, two pounds of water, of the temperature 76°, were poured into it. The result was 75° 30'. Then for every 35° 30' with two pounds of water, or every 44° with two pounds and a half of water, half a degree must be allowed for the heat absorbed by the pan.

24. Eleven experiments were made by Mr. Watt, from which the latent heat of steam has been calculated according to the following example. The heat of the water in the pan at the beginning of the experiment was 43·5, at the conclusion 89·5; so that, by the condensation of the steam, the water in the pan gained 46° of heat. The quantity of water in the pan at the beginning of the experiment was 17,500 grains, at the end 18,260; therefore the effect was produced by the condensation of a quantity of vapor equal to 760 grains. By multiplying the quantity of water in the pan, at the beginning of the experiment, by the increase of temperature from the condensed steam, and by the heat absorbed by the pan, we have $17500 \times 46^\circ \times 0.5 = 81375$; and by dividing this product by the weight of condensed steam, and adding to the quotient the heat of the mixture, we have $81375 \div 760 + 89.5 = 1159.5$, the sum of the sensible and latent heats. The sensible heat 212° being deducted, leaves 947·5 as the latent heat of steam.

25. In a similar manner, Mr. Watt determined the particulars of the other experiments, the results of which are exhibited in the following table:—

Number of the experiment.	Quantity of cold Water in Pan in Grains.	Temperature of the cold Water.	Weight of condensed Steam in Grains.	Temperature of the heated Water.	Increase of Heat.	Total sensible and latent Heat.	Latent Heat.
1	2	3	4	5	6	7	8
1	17500	43 ^o ·5	760	89 ^o ·5	46 ^o ·5	1159 ^o ·5	947 ^o ·5
2	17500	44·5	708	86·5	42·5	1136·9	924·9
3	17500	44·5	899	98	54	1149·1	937·1
4	17500	44·5	467·5	73·5	29·5	1175·6	963·6
5	17500	44·5	369	67·25	23	1158	946
6	17500	47·5	642	87	40	1177·3	965·3
7	17500	49	588·5	84·5	36	1155	943
8	17500	47	675	87·5	41	1150·5	938·5
9	17500	45	680·5	86·5	42	1166·5	954·5
10	17500	45	664·25	85·5	41	1165·66	953·66
11	17500	45	975	102	57·5	1134	922

26. The sum of the quantities in the eighth column divided by the number of experiments gives 945.03° as the average; but if the second and eleventh experiments, which yield results much smaller than the others, and which Mr. Watt therefore considered objectionable, be omitted, the average will be 949.9° . As several circumstances however affect these experiments, tending for the most part to make the latent heat appear rather less than it actually is, Mr. Watt considers that we shall not err in excess by calling it 960° .

27. One of the circumstances productive of the error above alluded to is the progressive increase or diminution of caloric by radiation, and by the contact of the surrounding atmosphere. This interference with his conclusions, neglected by Mr. Watt, was avoided in a very ingenious and satisfactory manner by count Rumford. At the commencement of his experiment, he rendered the temperature of his apparatus 10° or 12° lower than that of the surrounding air; and the vapor was then allowed to pass into the tube of the refrigeratory. Whilst the temperature of the water around the tube continued below that

of the air and adjacent bodies, caloric flowed into it, and it was consequently warmed by them. But the contrary effect occurred, of course, when the circumstances as to temperature were reversed; the surrounding bodies being warmed by the apparatus. Conducting his experiment therefore in such manner that the same time was occupied in each case, a compensation was obtained, the same quantity of caloric being retained by the whole apparatus as if no portion had been either absorbed or emitted. It is to this ingenious precaution, chiefly, that Biot is disposed to ascribe the superior accuracy of Rumford's experiments; and the agreement of their results with those of the profound investigator, Gay Lussac.

28. We have already intimated that the experimental results of Watt and Southern very nearly coincide. Mr. Southern's experiments were performed in 1803 with the intention of ascertaining the latent heat of steam under 3° of elasticity, viz. equal to the support of forty, eighty, and 120 inches of mercury. The following are the results brought into a tabular form:—

No. of Experiment.	Duration of the Experiment.	Weight of cold water in pounds.	Temperature of cold water.	Temperature at the end of Experiment.	Temperature gained.	Weight of water gained.	Temperature of Steam.	Elasticity of Steam in inches.
1	2	3	4	5	6	7	8	9
		lbs.	°	°	°	lb.		Inches.
1	12 45	28½	48	80	32	.878	229	40
2	5 50	28½	48	81½	33½	.857	270	80
3	4 00	28½	47½	81	33½	.826	295	120

29. From the above experiments may be calculated the latent heat of the steam formed in each. For, if the weight of the water which received the heat be multiplied by the number of degrees of temperature communicated to it, and the product be divided by the accession of weight to the water, the quotient will give the caloric which the steam lost. By adding to this the temperature of the water in the vessel at the conclusion of the experiment, a number will be obtained showing the whole heat, or the sum of the sensible and latent heat of the steam. Hence, by subtracting the sensible heat of the steam from this sum, the latent heat will be found. Thus $\frac{\text{col. 3} \times \text{col. 6}}{\text{col. 7}} + \text{col. 5} = \text{the sum of the sensible and latent heat};$ or if

$W = \text{weight of cold water, } T = \text{its temperature,}$

$w = \text{accession of water by the condensed steam,}$

$t = \text{temperature of warm water, and}$

$x = \text{sum of the sensible and latent heat of the steam condensed.}$

$$\frac{W + w \cdot t - WT}{w} = x.$$

30. If in either of the above equations the quantities found in the preceding table be properly employed, the sums of the sensible and

latent heat will be 1119° , 1190° , and 1228° and the latent heat 890° , 920° , and 933° . It was distinctly observed, however, that the tin vessel in which the steam was generated imparted heat to the surrounding air: and an experiment was made to determine the amount of this loss. It was found that, when the contained water was at 80° , 1° was lost in five minutes; and, when at 60° , 1° was lost in ten minutes and a-half; it would therefore, probably, lose 1° in eight minutes during the time of performing an experiment—the mean temperature being about 65° . As the excess of temperature at the beginning and end of each experiment above that of the air was nearly the same in all, the loss would be nearly proportional to the duration of each: hence, to the acquired heat should be added, in the first experiment, $1\frac{2}{3}^\circ$; in the second $\frac{2}{3}^\circ$, and in the third $\frac{1}{3}^\circ$; being severally proportional to the said duration. These being respectively added to the temperatures, in cols. 5 and 6, give in the former $81\frac{2}{3}^\circ$, 82° , and $81\frac{1}{2}^\circ$; and in the latter $33\frac{2}{3}^\circ$, 34° , and $33\frac{1}{2}^\circ$; and if either of these sets of numbers be used in the calculation, according as one or the other of the equations is adopted to develop the results, they will be found to be 1171° , 1212° , and 1245° , for the sums of the sensible and latent heat; and consequently the latent heat in each experiment will be 942° , 942° , and 960° .

31. From all the experiments to determine the quantity of heat latent in steam, notwithstanding their partial disagreement, it is evident that though steam produced under the ordinary pressure of the atmosphere does not indicate a higher temperature than boiling water, or about 212°, it does actually contain nearly 1200 thermometric degrees of heat. Steam, therefore, when mixed with six times its weight of water at 32°, will raise its temperature to 212°; and it is on this account employed in several brew-houses, dyeing works, and manufactories where large quantities of hot water are required. Many large buildings are also warmed by steam; and it is very advantageously employed in several drying processes where great heat is required,

and where the substances to be heated are liable to combustion.

32. To the latent heat thus existing in water when converted into steam, or to the caloric of vaporization, its elasticity is ascribable. Speculation has been active in endeavouring to show how this property is conferred by caloric, but hitherto without effect. Experiment has been more successful in ascertaining the extent of this elasticity; a subject of great practical importance. Many scientific individuals, as before stated, have directed their attention to this enquiry, and the results of their investigations will be found in the following copious synopsis, commencing at 212°

33. SYNOPSIS of experimental and calculated results on the elasticity of vapor.

34. Having, in the preceding paragraphs, furnished our readers with a series of practical illustrations relative to the formation of elastic vapor, it may now be advisable to proceed with a detailed history of the progress of the steam engine.

35. Among the numerous competitors for the honor of having first suggested steam, as a moving power in mechanics, we must certainly place Hero of Alexandria, Brancas, and the marquis of Worcester in the foremost rank.

36. The simple apparatus suggested by Hero about 2000 years ago may be readily understood by reference to the annexed figure. F represents

from these minute apertures the re-action produces a rotatory motion.

37. A more simple apparatus, acting on the

same principles, and employed by Mr. Partington in his lectures at the London Institution, may here be adverted to. A circular base D, and

upright pillar furnished with a point at C, support a moveable hollow ring. This is in the first instance filled with water, and the flame of burning alcohol beneath converts it into steam. The bent tube E performs the same office as that at A in the previous diagram, and the steam entering the air in the direction E A leaves an excess of force tending to make the ring revolve in the opposite direction.

38. The second of these candidates was an Italian philosopher of considerable eminence, and who, in 1629, published a treatise entitled *Le Machine*, &c., which contained a description of an apparatus for the same purpose.

39. Brancas's revolving apparatus, as will be seen by reference to the following diagram, was still more simple than that contrived by Hero.

SAVERY'S STEAM ENGINE.

Fig. 1.

Fig. 2.

lation of that part which relates to the steam engine. It occurs in the Transactions of the Royal Society for 1697. After alluding to the inconvenience of forming a vacuum by means of gunpowder, which was one of his early propositions, he recommends 'the alternately turning a small surface of water into vapor, by fire applied to the bottom of the cylinder that contains it, which vapor forces up the plug in the cylinder to a considerable height, and which (as the vapor condenses, as the water cools when taken from the fire) descends again by the air's pressure, and is applied to raise the water out of the mine.'

49. In 1698 Captain Savery obtained a patent for a new mode of raising water, and communicating motion to a variety of machines by the force of steam; and in the following year a working model of the above engine was submitted to the Royal Society, who then held their sittings in Arundel House. Savery's engine was employed to raise water to a given height by the pressure of the atmosphere, and then to force the fluid up the remaining elevation, by the power of steam acting on the surface.

50. The steam apparatus of captain Savery was usefully employed in the mines for many years, and as it forms the ground-work of both Kier's and Pontifex's vacuum engines of the present day, it may be advisable to furnish a detailed account of its construction:—

51. Plate I., fig. 1, STEAM ENGINE, represents a general view of the apparatus as employed for raising water. Two copper boilers are employed; they are set in furnaces of brick-work, so constructed that the flame and heated air can circulate around them to the greatest advantage.

52. In the upper part of each boiler is a small cock, *a* and *b*, called gauge-cocks. These, by means of screws, may be removed, in order that two-thirds of the quantity of water which it can contain may be introduced into the large boiler, and that the small boiler may be quite filled. The cocks are then replaced, and a fire is made beneath the great boiler, as represented in the engraving.

53. Two steam-pipes, *c* and *d*, proceed from the top of the boiler to the receivers *e* and *f*. These communications may be effectually closed, or opened and shut alternately, by an ingenious contrivance, represented on an enlarged scale, in fig. 2.

54. At the extremity of the lever connected with the bent handle *g* there is a square hole to which a pin is adapted. The upper part of this pin forms a pivot, and works in a cross bar *x*, which is supported by two screws, *y* and *z*, and the lower part passes through the lid of the boiler, having fixed to its extremity a brass plate, called the double slide valve, or regulator. This plate, being ground and fitted with great accuracy to the under surface of the lid of the boiler, prevents the escape of steam through either of the steam orifices, which it may cover; and the attendant, by moving the handle *g*, is enabled to open and shut alternately the steam passages; or, by stopping the regulator between the utmost limits of its movement, the orifices of both pipes may at the same time be effectually closed.

55. From the lower part of the receivers, *e* and *f*, proceed two pipes, *h*, *i*, resting on the standards 1 and 2; and to these are screwed two other pipes, 3 and 4, branching off to the chambers *k*, *l*, *m*, *n*, in which are valves, as exhibited in the engraving. Two other pipes 5 and 6, connect the chambers *k*, *l*, *m*, *n*, with the pipes *o* and *p*. The pipe *o*, which is called the suction-pipe, has its lower end immersed in a well or reservoir of water; and the pipe *p* is denominated the force-pipe.

56. The action of this engine is very simple. The steam generated in the large boiler is allowed to accumulate in the upper part, until the attendant conceives that a sufficient quantity is collected to supply the engine. He then, by means of the handle *g*, removes the regulator from beneath the orifice of the steam-pipe *d*; this allows the steam to rush from the boiler into the receiver *e*, whence, driving before it the whole of the air contained in the pipes and the receiver, it passes along the pipe *h* 3, through the valve *k*, into the force pipe *p*, where it communicates with the atmosphere.

57. The air being thus expelled from the receiver, and its place occupied by steam, the attendant closes the communication with the boiler, and places the orifice of the cock *r*, in such position, that a stream of cold water can be discharged from the cistern *s* upon the external surface of the receiver. This abstracts from the steam that portion of caloric which is necessary to maintain its elastic state; and as water, on its conversion into steam, is found to occupy a space about 1800 times greater than its former bulk, the condensation of the vapor must necessarily produce within the receiver a vacuum. Nothing, therefore, is left to counter-balance the atmospheric pressure on the surface of the water in which the bulb of the suction-pipe *o* is immersed; and as this pressure, when the vacuum is perfect, can raise a column of water to the height of thirty-three feet, the water ascends into the receiver, and fills it.

58. The receiver being thus filled, the lower clack-valve *l* closes. If the double slide valve be now removed from the orifice of the steam-pipe *d*, the steam will rush from the boiler, and drive the water from the receiver into the force-pipe *p*, from which it cannot escape on account of the clack-valve *k*.

59. That steam should press upon a liquid in the same manner as upon a solid piston may to many appear surprising; but it should be recollected that the specific gravity of steam, air, or any of the gases, is less than the specific gravity of liquids, otherwise they could not be maintained in a vaporous or gaseous state; and further, that, as no fluid can descend through one which is much heavier than itself, steam cannot descend through water; the steam, entering into the receiver, must continue on the surface of the water, pressing upon every portion of it until the water is removed, and the receiver again filled with steam. Therefore, the attendant has only occasion to allow cold water to flow from the cock *r* upon its outer surface, to produce, as before, a vacuum, and to fill again the vacant space with water from the well.

60. Having thus exhibited the action of the engine, as far as regards one receiver, it is very easy to conceive that, by means of the two steam-pipes and two receivers, an alternate effect may be maintained, and a constant discharge of water kept up at the top of the force-pipe *p*.

61. The quantity of steam consumed in maintaining the alternate actions of the engine quickly reduces the water in the boiler; and, as danger might occur from allowing the water to descend too low, the gauge-cocks, *a* and *b*, have been judiciously introduced. The gauge-cock *a* descends within the great boiler to about one-half of its depth; and the cock *b*, in the small boiler, to within eight inches of the bottom. When the attendant conceives that the great boiler requires to be replenished, he turns the handle of the cock *a*: if steam issues, the water is below that level, and the boiler must be supplied; but, if otherwise, water alone is discharged.

62. When this trial indicates that a supply is required for the great boiler, the attendant kindles a fire beneath the small, or, as it is called, the subsidiary boiler. By placing this at the side of the large boiler the water within is raised by the waste heat nearly to ebullition; consequently it requires but a small addition of caloric to convert a sufficient quantity into steam to expel the water into the large boiler. The steam which is thus generated, having no opportunity to escape, depresses the water and causes it to ascend up the pipe *t*, through the clack-valve 3, and along the bent pipe *u*, into the large boiler; and this discharge continues so long as the surface of the water is above the lower orifice of the pipe *t*, which is within eight inches of the bottom of the boiler. When it is below that point, the steam, in passing through the clack-valve 3, makes a rattling noise, and indicates that the small boiler requires to be replenished. To effect this the attendant turns the cock *v*, which, being connected with the inclined pipe *w*, admits water from the force-pipe.

63. The comparative simplicity of this engine affords a strong inducement for its adoption; but its application is, unfortunately, attended by a great waste of steam, and consequent useless expenditure of fuel. In order to drive the water from the receivers, *e* and *f*, into the force-pipe *p*, we have stated that steam must be admitted upon its surface. This steam possesses a sensible temperature, from 150° to 200°, higher than that of the water; consequently, by contact with it, a considerable portion is condensed, and thereby raises the surface of the water nearly to the temperature of ebullition. The extreme slowness with which caloric descends in fluids allows the water to form a heated stratum between the steam and body of cold water. Then, rapidly accumulating in quantity, the steam, by compression, acquires sufficient force to expel the water into the force-pipe *p*, and, overcoming the weight of the column contained in the pipe, discharges an equal portion at the top. As the water descends in the receivers a new source of condensation occurs; the steam comes in contact with successive portions of the cold surface of the metal, and, according to professor Robison, not less than eleven-twelfths of that which is

generated in the boiler are thus uselessly expended.

64. Another imperfection, which operated against the introduction of this engine into mines, is the limited height to which, by suction, as it is improperly termed, and by the pressure of the steam, water can be raised. By suction, or, in other words, by the pressure of the atmosphere, water can be raised from twenty-three to thirty feet; and, from the nature and strength of the materials of which it is composed, steam should not be applied to force the fluid to a greater height than sixty or seventy,—an elevation amounting to about sixteen fathoms. How inadequate this engine must be for the purposes of mining is easily perceived. In Savery's time some of the mines were, perhaps, not less than 100 fathoms deep; and, at the present time, several exceed 200 fathoms, or 400 yards.

65. To render the engine effectual for these depths captain Savery proposed that one should be erected at every fourteen or fifteen fathoms: but the expense of attendants, and the consumption of fuel, added to the annual expenditure for wear and tear, would, in this arrangement, exceed the expense incurred by the employment of horses. Besides, there is a liability that one engine should become deranged; in which case the works must cease, as all the other engines would be rendered ineffectual.

66. In the engines constructed under the authority of Savery's patent it was necessary for a laborer to be in constant attendance for the purpose of turning the cocks, which alternately admitted the steam and condensing water. M. de Moura however effected a considerable improvement in this part of the engine, by constructing a self-acting apparatus for this purpose.

67. M. De Moura's apparatus was made self-acting by a very simple contrivance. It consisted of a float within the receiver, composed of a light ball of copper, which is not loose therein, but fastened to the end of an arm or lever, which is made to rise and fall by the float, while the other end of the arm is fixed to an axis; and consequently, as the float moves up and down, the axis is turned round one way or the other. This axis is made conical, and passes through a conical socket, which is soldered to the side of the receiver, and upon that end of the axis which projects beyond the socket; and therefore, at the outside of the receiver, is fitted a second arm, which is also moved backwards and forwards by the axis as the float rises and falls. By these means the rising and falling of the surface of the water within the receiver communicates a correspondent motion to the outside, in order to actuate the rest of the gear, which regulates the opening and shutting of the steam and injection-cocks.

68. A small cistern is soldered to the outside receiver; and, being kept full of water, surrounds the joint, or conical socket through which the axis of the float passes: this keeps the axis and socket air-tight. The cistern is constantly kept full of water by means of a small leakage from the force-pipe, through a wooden peg, and the drops are conducted by a packthread down to the cistern. A small weight is applied to the

NEWCOMEN'S
STEAM ENGINE.

Fig. 1.

arm on the outside of the receiver, to counterpoise the float within; also upon the same arm is a slider, which, being set nearer to, or farther from the axis, will rise or fall a greater or less space, as may be required; when the float within rises or falls and the slider can be fastened by a screw at any part. A chain is attached to the slider, and gives motion by means of a shorter chain to a balance, or tumbler, which moves on an axis, and opens and shuts the cocks. The first-mentioned chain passes over two pulleys, supported by two arms, that are fastened to the side of the receiver, which give a chain a proper horizontal direction: in order to move the balance to the end of the chain a weight is fastened sufficient to raise the balance to a perpendicular position, and also to overcome the friction of the float and its axis with the pulleys and chain.

69. The balance moves upon an axis, which is supported in pieces projecting from the receiver; and it has three arms, one of which applies with a roller to the handle of the steam-cock, a second acts upon the lever of the injection-cock, and a third short arm has a piece of chain, to link it to the chain before-mentioned, at the part where the same extended horizontally between the two pulleys. The arms, which act upon the cocks, are so placed as to shut the steam cock the moment before the injection is opened, and vice versâ.

70. To put the engine in motion press down the arm of the axis, which raises the float within the receiver, and the counter-weight of the chain will bring the balance over to the right side, and in its motion will open the steam-cock, and shut the injection-cock: also open a small gauge-cock in the top of the receiver, that the air may be discharged by the entrance of the steam into the receiver. This being done, shut the air-cock and let go the arm of the balance: the weight at the end of the chain will bring over the balance to the left, and in its motion will shut the steam cock and open the injection-cock, to admit a small jet of cold water into the receiver, which, presently condensing the steam into water, in a great measure leaves a vacuum in the receiver. In this situation the pressure of the atmosphere will cause the water to mount through the suction-pipe into the receiver, where, as its surface rises, it makes the float ascend, and, depressing the arm on the outside of the receiver, draws the chain and raises the balance, till it has passed the perpendicular, when it will fall over suddenly by its own gravity: in falling, the roller of one of its arms takes hold of the handle of the steam-cock, and opens it, whilst the other one shuts the injection-cock. This fall of the balance takes place when the receiver is almost filled with water, and the balance cannot return till the surface of the water therein subsides and suffers the float to descend. This takes place as soon as the steam ceases to be condensed by the cold receiver, and acquires sufficient elastic force from its heat to fill the receiver and drive out the water from the forcing pipe. When the surface of the water descends the float sinks, and suffers the counter-weight to draw up the chain. By the short chain it draws the balance beyond the perpendicular towards the left, when it falls of its own accord, and, in falling, the one arm takes

hold of the handle and shuts the steam-cock, whilst the other opens the injection-cock as before.

71. The atmospheric piston engine will come next in order, and its claim to practical utility is much greater than either of those already described.

72. A very simple and at the same time ingenious mode of illustrating the operations of an atmospheric steam engine, will be found in the annexed apparatus, suggested by professor Brande, and employed in his lectures at the London Institution.

73. The glass tube and bulb B is shown with its piston A; the rod being hollow and closed by a screw C. If steam be generated by the spirit lamp D, the air will speedily be expelled; and after this is effected the screw C may be closed, and a working stroke produced by artificial condensation.

74. Having thus furnished our readers with a practical illustration of the principle of Newcomen's engine, we may now proceed with a detailed account of its various parts. In Plate II., STEAM ENGINE, the boiler A is set in a furnace of brick-work, so contrived that the flame and heated air can pass beneath it, and circulate through the side-flues, *a, b*, into the chimney.

75. Between this boiler and the cylinder C there is a pipe, or communication, *d*, which can be opened and closed at pleasure by the regulator *f*.

76. The cylinder C has a piston accurately fitted to it, so that when moving it is steam-tight. On the external surface of the cylinder are projections or lugs, *e, e*, which support the cylinder on the beams *g, g*, only one of which is shown, the other being removed to exhibit the parts in section.

77. The piston H, which is adapted to the cylinder, is formed of different materials to make it steam-tight. The lowest piece represents a strong circular plate of iron, the diameter of which is very nearly equal to the internal diameter of the cylinder. Above this, and projecting from it, there is a circular ring, and between it and the cylinder a stuffing of oakum or gasket, lubricated with tallow, to lessen the friction.

78. D a lever or beam, strongly framed and braced, and having concentric arcs, similar to those already described, to maintain the rods which are suspended from them in a vertical direction.

79. The pump E is called the jaquette or jack-head, and is employed to force water along the pipe *h*, through the valve *i*, into the air-vessel

k, whence it is conveyed by the pipe *l* into the injection cistern *F*. From this cistern proceeds a pipe, *m*, and, at about half its length, is placed the stop-cock *n*, and a little above, a branch-pipe, *p*, the orifice of which projects over the side of the cylinder. The water from *p* falls upon the piston, and is intended to assist in keeping it air-tight.

80. A circular chamber, 3, surrounds the upper part of the cylinder, to receive the water which may flow over during the ascent of the piston. It is furnished with two pipes, *u* and *v*: the former is called the feed-pipe, supplying the boiler with a portion of the water which has been heated by being in contact with the piston and sides of the cylinder; and the latter allowing the surplus water to flow into the hot-well *G*.

81. From the lower part of the cylinder proceeds a small-pipe *t*, furnished with a cup and valve, called the snifting valve; and from the feed-pipe a small branch descends nearly to the cup, for the purpose of supplying it with water. From the top of the boiler proceeds a horizontal pipe, having a loaded valve 21, connected with a small cord passing over a pulley. By means of this cord, the attendant raises the valve, to allow the steam to escape when the engine ceases working.

82. The movement of the regulator, instead of being effected by the hand, as in the original engine of Newcomen, is, in the improved apparatus by Beighton, produced by a series of ingenious contrivances. The valve is connected with a vertical spindle *x*, and a horizontal lever *y*, and the rod *z*, instead of being moved by the hand of the attendant, is impelled so as alternately to cover and uncover the extremity of the steam pipe. To effect this, the upright post, *I*, supports one end of a horizontal iron axis, marked 1; the other end of it, being supported by another post, can only be seen at *K*, fig. 2. From this axis is freely suspended, by two rings, 2 and 3, a kind of stirrup, formed of two parallel bars of iron, 4 and 5, and a cross-bar, 6, together somewhat resembling the letter *H*. Above this is another cross piece or spindle, 7, which, passing through the eyes of the fork 8, connects the rod *z*, of the lever *y z*, with the stirrup. As this stirrup is freely suspended, the horizontal axis, 1, may be made to revolve in either direction, without communicating its motion to the stirrup, which will remain suspended vertically beneath it, unless force be applied to remove it either to the right or left.

83. On the same horizontal axis, 1, is fixed a piece of iron 9, having at one end a fork 10, and at the other a lump of iron or lead. This piece is called the *Y*, from its resemblance to that letter inverted; and is so placed on the axis 1 that one of the prongs is situate on each side of the stirrup. The space or distance between the prongs is rather more than sufficient to allow the tail of the *Y* to be placed upright, without removing the stirrup 6, fig. 1, when it inclines

either to the right or left. In the present position of the engine, the stirrup 6 is represented to the left of the upright post *I*, and the regulator covers the orifice of the steam-pipe *d*. Let, therefore, the *Y* be raised from its inclined position, and placed on the opposite side of the post with a sufficient inclination for the weight, or, as it is termed, the logger-head or tumbling bob, at the end of the *Y*, to descend by its gravity; then, releasing it from the hand, it will descend with considerable force, and, with a smart jerk, place the stirrup 6 to the right of the post. This jerk is very efficacious, as it instantly overcomes the cohesion and friction of the regulator with the orifice of the steam-pipe *d*. The *Y* is prevented falling too far by a cord or strap *o o*, which is fastened to the logger-head and to the cylinder-beam *g*. By lengthening or shortening this strap, the fall of the logger-head can be regulated to any required distance.

84. Having thus exhibited the manner in which the *Y* influences the regulator, it only remains for us to observe that by the reciprocation of the beam *D* an alternating motion is given to the plug-tree *L*. This plug-tree is formed of two parallel pieces to admit two bent handles, called spanners, which are fastened on the same horizontal axis as the *Y*, to move between them. In the alternating motion of the plug-tree, the spanners 19 and 20 are struck by pins, which are placed horizontally, as may be seen by reference to the plan. By means, therefore, of these contrivances, the logger-head is jerked alternately to the right and left of the upright post, and the steam-valve is opened and closed at the proper intervals.

85. In a similar manner the movement of the cock which regulates the injection is effected. To the beam *g g* is fastened a bar *o*, from which is suspended the piece 13, 14, 15, called the hammer, or more commonly the *F*, from its resemblance to that letter. It consists of a lump of metal 13, a fork 14, and a long tail or spanner 15. By the movement of the plug-tree, a pin raises the horizontal bar 16, 17, and releases the head of the *F* from the catch by which it is supported; it therefore descends with considerable force, and causes the fork 14, between the prongs of which is the arm *w*, to open the injection-cock. On the descent of the plug-tree, another pin depresses the tail 15 of the *F*, and replaces the head in the catch 16. By this movement the injection-cock is gradually closed, which is necessary, as otherwise the warmth of the cylinder would be apt to impair the vacuum by reconverting a portion of the water into steam.

86. In order to determine the best proportions of the parts of Newcomen's engine, Mr. Smeaton made numerous experiments, and the results furnished him with data for the construction of engines of any required power. This important information is contained in the following table:—

TABLE by Mr. SMEATON, for proportioning the parts of Newcomen's Engine.

Cylinder.		Boiler.		Steam-pipe.	Injection.	Stroke.	
Diameter in inches.	Area in inches.	No.	Centre Diameter in feet and inches.	Diameter in inches.	Sq. hole in inches.	Length in feet and inches.	Number per minute.

The surface in the flues is taken at half.

These have two boilers.

88. The different columns of this table explain themselves, except the great product per minute. This is the effect of the engine expressed in a convenient manner, to separate it from all considerations of the diameter or lift of the pumps, or of the number of strokes which the engine makes in a minute, being the multiple of all these, and is thus obtained:—Multiply the square of the diameter of the cylinder in inches, by the pressure on each square inch of the piston, not expressed in pounds weight, but in the height of a column of water in feet; and this again is multiplied by the velocity of the motion of the piston per minute. For example, a twenty-six inch cylinder square of diameter (676) × 18 feet, the pressure per square inch in feet of water, = 12168 × 76·21 feet, the journey per minute, = 927323, the great product per minute, as per table. The table is calculated upon the supposition that the pressure upon each square inch of the piston is eight pounds avoirdupois, or eighteen feet column of water.

89. The last column, or effect per minute of one bushel of coals per hour, is a comparative view of the effect of different sized engines, showing the advantages of large engines in respect to small, in the quantity of work they will effect in proportion to the coals they consume.

90. To find the number of bushels of coals which any of the engines will consume per hour, calculate the internal surface of the cylinder in square inches, and add to it three times the square of the diameter to allow for the piston bottom, cylinder bottom, and the surface of the pipes which are within the cylinder. Next calculate the solid content of the cylinder in cubic inches, and find the proportion between the superficial and the solid measure of the cylinder: according to the number of this proportion, find a number in the following table for a division.

Proportion of the surface of the cylinder to its capacity in square and cubic inches.	Effect of one bushel per hour.
1	98 = 90
2	188 = 85
3	273 = 76
4	349 = 65
5	414 = 54
6	468 = 44
7	512 = 33
8	545 = 22
9	567 = 11
10	578 = 0
11	578 = 8
12	572

91. Lastly, cut off three places of figures from the great product per minute, and, dividing by the divisor, the quotient will be the effect of one bushel per minute.

92. For example, a seventy-two inch cylinder: its circumference will be 226·3, which, multiplied by 135 inches, the length, gives

30,550 square inches; and adding thereto 15,552, which is three times the square of the diameter, we have 46,102 superficial inches; and the content of the cylinder is 549,652 cubic inches. By seeking in the last table for 11, 9, or 12, we find the number 572 for the divisor of the great product, after cutting off its three last figures, viz. $7558 \div 572 =$ thirteen bushels per hour.

93. By this way of finding the proportion between the surface and the content of the cylinder, an allowance is made for the loss of steam which takes place from condensation, when it enters into the cylinder at every stroke, after it has been cooled by the injection thrown into it.

94. We now come to a most important period in the history of this gigantic machine: a period indeed when the towering genius of a self-educated mechanic converted the irregular and almost unmanageable drudge we have hitherto been considering into an engine, second only to the vital frame in the perfection and accuracy of its movements. The history of Mr. Watt's first connexion with the steam engine is thus detailed:—In 1763 he was employed to repair a working model of the atmospheric engine belonging to the university of Glasgow, and during this employment observed the great loss of steam from the condensation of the cold surface of the cylinder. He found that a great quantity of heat is contained in a very minute quantity of water, in the form of elastic steam; for, when a quantity of water is heated several degrees above the boiling point in a close digester, if a hole be opened the steam rushes out with great violence, and in three or four seconds the heat of the remaining water is reduced to boiling heat. If the steam be condensed the whole of it will afford only a few drops of water, yet this small quantity in the state of steam carried off with it all the excess of heat from the water of the digester. Mr. Watt reasoned thus: that, if so great a quantity of heat is contained in a certain quantity of steam, the economical use of the steam was a matter of great importance in the improvement of the engine, more than the construction of the furnace, which had been the chief object of former efforts to improve the engine. The cylinder of the little model was heated when the steam was in it, so that it could not be touched by the hand; but, before a vacuum could be made, it required to be cooled by the injection and was then to be heated.

95. All Mr. Watt's early improvements were secured to him by right of patent; and, as they form a new era in the steam engine, they well deserve particular notice.

96. Patent, 25th of October, 1781. 'For certain new methods of applying the vibratory or reciprocatory motion of steam or fire-engines, to produce a continued rotative or circular motion round an axis or centre, and thereby to give motion to the wheels of mills, or other machines.'

97. The specification, dated 13th of February, 1782, contains a description of five different contrivances of rotative motion.

98. Patent, 12th of March, 1782.—'For certain new improvements upon steam or fire-engines for raising water, and other mechanical

purposes, and certain new pieces of mechanism applicable to the same.

99. The specification, dated 3rd of July, 1782, contains, first the expansive steam engine, with six different contrivances for equalising the power; second, the double power steam engine, in which the steam is alternately applied to press on each side of the piston, while a vacuum is formed on the other; third, a new compound engine, or method of connecting together the cylinders and condensers of two or more distinct engines, so as to make the steam which has been employed to press on the piston of the first, act expansively upon the piston of the second, &c., and thus derive an additional power to act either alternately or conjointly with that of the first cylinder; fourth, the application of toothed racks and sectors to the ends of the piston or pump-rods, and to the arches of the working-beams, instead of chains; fifth, a new reciprocating semi-rotative engine, and a new rotative engine or steam-wheel.

100. Patent, 28th of April, 1784.—‘For certain new improvements upon fire and steam-engines, and upon machines worked or moved by the same.’

101. The specification, dated 24th of August, 1784, describes, first, a new rotative engine, in which the steam vessel turns upon a pivot, and is placed in a dense fluid, the resistance of which to the action of the steam causes the rotative motion; second, methods of causing the piston-rods, pump-rods, and other parts of engines, to move in perpendicular or other straight lines, and to enable the engine to act upon the working-beams both in pushing and pulling; this is now called the parallel motion, and three varieties are described; third, improved methods of applying the steam engine to work pumps, or other alternating machinery, by making the rods balance each other; fourth, a new method of applying the power of steam engines to move mills which have many wheels required to move round in concert; fifth, a simplified method of applying the power of steam engines to the working of heavy hammers or stampers; sixth, a new construction and mode of opening the valves, and an improved working gear; seventh, a portable steam engine and machinery for moving wheel-carriages.

102. Patent, in 1785.—‘For certain newly improved methods of constructing furnaces or fire-places for heating, boiling, or evaporating of water and other liquids which are applicable to steam engines and other purposes; and also for heating, melting, and smelting of metals and their ores, whereby greater effects are produced from the fuel, and the smoke is in a great measure prevented or consumed.’

103. The specification is dated 14th of June, 1785.

104. The act of parliament, extending Mr. Watt's exclusive privilege for the improvements secured to him by his first patent, expired in 1800, at which period he retired from business, having, for some years before, ceased to take an active part.

105. Mr. Watt's first great improvement in the engine of Newcomen may be best under-

stood by reference to the annexed diagram, in

which A represents the cylinder, and B its plug or piston, made to fit air-tight. The pipe C is furnished with a stop-cock D, by means of which the elastic vapor is occasionally admitted; a similar pipe, furnished with a stop-cock at F, passes from the other side of the cylinder, and enters the vessel G; E is a reservoir to contain water. If we now suppose the piston at the bottom of the cylinder, and steam admitted by the pipe C, its expansive force will elevate the piston, and the whole inter-

nal cavity of the tube will be filled with condensable vapor. On closing the steam-cock, and opening that connected with the vessel G, a portion of the vapor will immediately expand itself, and, coming in contact with the cold sides of the vessel, a portion of its heat must be absorbed by the water at E. A new supply of steam then descends, and is also condensed; and indeed the same process continues till the whole of the steam is drawn from the tube. A vacuum being thus formed, the pressure of the atmosphere will preponderate, and the piston-rod be depressed to the bottom of the tube. On closing the stop-cock F a new portion of steam may be admitted by the other pipe, and, after raising the piston, the process of condensation may be readily repeated.

106. The advantages that arise from this mode of forming a vacuum are very considerable, not the least important of which is a saving of nearly half the fuel. In the old engine the condensing water must reduce the temperature of the internal surface of the cylinder to that of the atmosphere, before a vacuum could be produced; and, when the condensing-water was applied more sparingly, the elastic vapor remaining in the cylinder was found to materially reduce the pressure of the air operating above. The great advantage, then, of Mr. Watt's apparatus consists in performing the condensation in a separate vessel, so that the cylinder is always preserved at the temperature of boiling water.

107. Having thus produced a vacuum, without the intervention of condensing-water beneath the piston, Mr. Watt's next improvement consisted in closing the top of the cylinder, so that the piston-rod worked through an air-tight hole in the centre of the cap; and, to ensure the necessary pressure within the cylinder, steam with an elastic force greater than that of the atmosphere was admitted above the piston. The atmospheric engine of Newcomen was thus

converted into a steam engine, and its power was easily regulated.

108. The double acting engine requires nearly twice the quantity of steam that would be necessary for a single engine of the same size ; but this is compensated for by its doing twice the quantity of work. And, after what has been said upon the principle of the single engine, little need be added in explanation of the double one ; for, its principles being the same, a mere change of mechanism is all that is required to produce the machine.

109. In order to a due comprehension of the action of the double engine, some of the contrivances that have been adopted to produce a proper distribution of the steam, and an alternate vacuum, must next be noticed, and although the four-way cock, and sliding regulator are not considered as the most perfect of these, yet they are very frequently applied to small steam engines, and their simplicity gives them a preference. Let *Y Z* represent a section of a steam engine cylin-

der with its piston, and the piston rod moving through a stuffing-box, so as to be quite air-tight ; *g* is the steam-pipe for bringing steam from a boiler, and this terminates in a four-way cock *h i*, which together with the pipes *m, n,* and *o,* are drawn much too large for the cylinder *Y Z,* in order that their parts may be distinctly seen : *p* is the end of a lever or handle for the purpose of turning the cock when required. This cock is constructed precisely in the same manner as other cocks for fluids, and consists of a conical plug or pin ground very truly into the body of the cock itself ; but instead of having a single straight passage through the plug, as is commonly the case, there are two curved ones *h* and *i,* which give the plug the appearance of having four openings, each appearing in the same plane, and at one quarter of the circumference apart, so that, as the cock stands in the figure, steam coming from *g* would pass through the opening *i* in the plug, and would be delivered into the pipe *n* at right angles to its first direction, instead of passing directly onwards to *o,* as would be the case in a common cock. From the pipe *n* the steam would pass immediately into the lower part *Z* of the cylinder, and consequently would drive the piston upwards. At the same time it

will be seen that there is an immediate connexion between the upper part *Y* of the cylinder through the pipe *m,* and opening *h* of the cock to the pipe *o,* leading down to the condenser ; consequently, so long as the steam is acting against the under side of the piston, there will be a vacuum at *Y* to permit it to rise. So soon as the piston has arrived near the top of the cylinder, the cock must be turned one quarter round by depressing its handle *p* from its present position to that shown by the dotted lines at *q,* by which all the openings in the plug of the cock will be changed : steam, therefore, which now enters at *g,* will be turned upwards by the passage *h,* and by entering the pipe *m* will be conveyed above instead of below the piston, while the passage *i* forms a connexion between the pipe *n,* leading to the lower part of the cylinder, and the pipe *o* leading to the condenser ; consequently, in this position, a vacuum will be formed below the piston, while the steam is operating above it. The piston will therefore descend, and, on coming near the bottom, the cock must be again turned into its first position, when the piston will ascend, and so on ; thus producing an equality of force, both in the up and down strokes, by simply turning a small cock.

110. Having in the preceding pages strictly adhered to a chronological arrangement of the improvements in the steam engine, it may now be advisable to furnish our readers with a sketch of its earliest application to the purposes of navigation :—

111. The possibility of employing steam as a moving power in the navigation of vessels was known early in the last century ; its practical application, however, on a large scale, has not been fully established above twenty years.

112. In 1698 Savery recommended the use of paddle-wheels, similar to those now so generally employed in steam vessels, though without in the remotest degree alluding to his engine as a prime mover ; and it is probable that he intended to employ the force of men or animals working at a winch for that purpose. About forty years after the publication of this mode of propelling vessels, Mr. Jonathan Hulls obtained a patent for a vessel in which the paddle wheels were to be driven by an atmospheric engine of considerable power.

113. In describing his mode of producing a force sufficient for towing of vessels, and other purposes, the ingenious patentee says, ‘ In some convenient part of the tow-boat there is placed a vessel about two-thirds full of water, with the top close shut ; this vessel, being kept boiling, rarefies the water into steam ; this steam being conveyed through a large pipe into a cylindrical vessel, and there condensed, makes a vacuum, which causes the weight of the atmosphere to press on this vessel, and so presses down a piston that is fitted into this cylindrical vessel, in the same manner as in Mr. Newcomen’s engine, with which he raises water by fire.

114. ‘ It has been already demonstrated that when the air is driven out of a vessel of thirty inches diameter (which is but two feet and a half) the atmosphere will press on it to the weight of four tons 16 cwt. and upwards ; when

proper instruments for this work are applied to it, it must drive a vessel with great force.

115. Mr. Hulls's patent is dated 1736, and he suggested the use of a crank to produce the rotatory motion of his paddle-wheels; this ingenious mode of converting a reciprocating into a rotatory motion was afterwards recommended by the abbé Arnal, canon of Alais in Languedoc, who, in 1781, proposed the crank for the purpose of turning paddle-wheels in the navigation of lighters.

116. It is probable that Mr. Hulls anticipated some objection to his new mode of propelling vessels; and it appears from captain Savery's statement, to which we have already alluded, that a strong prejudice had been raised against the use of propelling wheels in vessels. Mr. Secretary Trenchard, who was at that time at the head of the admiralty, had also given a decided negative to the proposition. In answer therefore to the objections which might have been anticipated, Mr. Hulls proposed the following queries, which he afterwards solved in the most satisfactory way.

117. *Query 1.*—Is it possible to fix instruments of sufficient strength to move so prodigious a weight as may be contained in a very large vessel?

118. *Answer.*—All mechanics will allow it is possible to make a machine to move an immense weight, if there is force enough to drive the same; for every member must be made in a proportionable strength to the intended work, and properly braced with laces of iron, so that no part can give way, or break.

119. *Query 2.*—Will not the force of the waves break any instrument to pieces that is placed to move in the water?

120. *Answer.*—First, It cannot be supposed that this machine will be used in a storm or tempest at sea, when the waves are very raging; for if a merchant lieth in a harbour, &c., he would not choose to put out to sea in a storm, if it were possible to get out, but rather stay until it were abated. Secondly, when the wind comes a-head of the tow-boat, the fans will be protected by it from the violence of the waves, and, when the wind comes side-ways, the waves will come edge-ways of the fans, and therefore strike them with the less force. Thirdly, there may be pieces of timber laid to swim on the surface of the water on each side of the fans, and so contrived as they shall not touch them, which will protect them from the force of the waves.

121. *Up inland rivers, where the bottom can possibly be reached, the fans may be taken out, and cranks placed at the hindmost axis to strike a shaft to the bottom of the river, which will drive the vessel forward with the greater force.*

122. *Query 3.*—It being a continual expense to keep this machine at work, will the expense be answered?

123. *Answer.*—The work to be done by this machine will be upon particular occasions, when all other means yet found out are wholly insufficient. How often does a merchant wish that his ship were on the ocean, when, if he were there, the wind would serve tolerably well to carry him on his intended voyage; but does

not serve at the same time to carry him out of the river, &c., he happens to be in, which a few hours' work at this machine would do. Besides, I know engines that are driven by the same power as this is, where materials for the purpose are dearer than in any navigable river in England. Experience, therefore, demonstrates that the expense will be but a trifle to the value of the work performed by those sort of machines which any person who knows the nature of those things may easily calculate.

124. M. Duquet appears to have tried revolving oars as early as the year 1699, and experiments were made with them on a large scale both at Marseilles and at Havre: this mode, however, of impelling vessels was soon given up as impracticable; and after our countryman, Hulls, the marquis de Jouffroy unquestionably holds the most distinguished rank in the list of practical engineers, who have added to the value of this invention.

125. It is evident, from an article published in the *Journal des Debats*, that in 1781 the marquis constructed a steam boat at Lyons, of 140 feet in length. With this he made several successful experiments on the Saone, near that city. The events of the revolution, which broke out a few years afterwards, prevented M. de Jouffroy from prosecuting this undertaking, or reaping any advantage from it. On his return to France after a long exile, in 1796, he learned from the newspapers that M. de Blanc, an artist of Trevoix, had obtained a patent for the construction of a steam boat, built probably from such information as he could procure relative to the experiments of the marquis. The latter appealed to the government, which was then too much occupied with public affairs to attend to those of individuals. Meanwhile Fulton, who had gained the same information, and was making similar experiments near the Isle des Cygnes, alarmed M. de Blanc, who knew that he had much more to fear from the influence and mechanical skill of an Anglo-American than from that of an emigrant. He accordingly alleged his patent right, and requested the stoppage of Mr. Fulton's works, who returned for answer that his essays could not affect France, as he had no intention to set up a practical competition upon the rivers of that country, but should soon return to America, which he actually did, and commenced the erection of those engines to which he has since laid claim as exclusive inventor.

126. Shortly after the first experiments were made, by the marquis de Jouffroy, a gentleman of the name of Miller, who resided at Dalswinton, published a work, in which he described the application of wheels to the working of triple vessels on canals; and in 1794 he completed a model of a boat on this construction, impelled by a steam engine.

127. From this period till 1801, but little progress appears to have been made in this species of navigation: in that year Mr. Symington, who had been employed in the construction of Miller's vessel, tried a boat propelled by steam on the Forth-and-Clyde inland navigation; this, however, was shortly laid aside, on account of the injury with which it threatened the banks of

STEAM ENGINE.
MR BATT'S ENGINE.

J. Shaw's sculp.

the canal, from the violent agitation produced by the paddle-wheels.

128. Mr. Symington's mode of connecting the piston and paddle-wheel was by placing the cylinder nearly in a horizontal position, so that by this means the necessity of employing a working beam was avoided. The piston was also supported in its position by friction-wheels, and communicated, by means of a rod, with a crank connected with the wheel, which imparts a motion to a paddle somewhat slower than its own. The paddle wheel was placed in the middle of the boat towards the stern, and on this account it became necessary to have a double rudder, connected by rods, which were moved by a winch placed at the head of the boat.

129. Mr. Symington also employed stampers placed at the head of the boat, for the purpose of breaking the ice on canals; and this plan, we believe, was also adopted in the original construction of the vessels intended for the Arctic expedition.

130. In 1795 a very ingenious apparatus was invented by lord Stanhope, and tried by that nobleman in Greenland Dock. In this experiment the paddles were made to resemble the feet of a duck, and were placed under the quarters of the vessel. This plan was also tried in America, but it does not appear in either case to have answered the expectations of its projector.

131. A plan has also been tried which in some measure resembles the endless chain of a pump. This was, we believe, first employed in the duke of Bridgewater's canal, and consists in the use of a chain, with a number of paddles attached to it, going over two wheels placed level with the water line. A steam engine, acting on the foremost roller, gave motion to the chain, and a continuous parallel motion was thus effected.

132. Having already described the general arrangement of a steam engine, as improved by Mr. Watt, it may now be advisable more particularly to point out the arrangement of its mechanism in detail. For this purpose we may select the single acting engine as employed for pumping.

133. Plate VIII. ABC represents the beam, which is made of cast-iron instead of wood, and is composed of two large plates, of the shape represented in the figure, put together at twelve inches distance from each other, leaving a space between them, the centre or axis B passing through the middle of both plates. The axis lies on the floor D, which is sustained by the wall E, built beneath the centre. Q is the cylinder, contained within a steam jacket, composed of segments screwed together. FF is the steam-pipe coming from the boiler G. *ab* is the piston-rod, connected with the end C of the beam, by links C, *b*; and whilst the upper ends of these links move in the arc of a circle, with the end of the beam, the lower ends, *b*, are made to accommodate themselves to the vertical motion of the piston-rod *a*, by means of the rods *c*, extending to the smaller links, *d*, which form a parallelogram. The motion of the parallelogram is governed by the bridle-rods, which move about a fixed centre *m*; the lower ends *b*, of the links *b*, C, will ascend and descend in a perpen-

dicular right line. A similar motion, but of half the quantity, is given to the rod R, which works the air-pump, N, of the engine at the lower end, and the middle part of the rod has the plug-beam, R, attached to it, which has pins, or chocks, screwed on it to actuate the handles, *x*, *y*, and *z*, of the mechanism for the valves, which mechanism is very different from that employed in the old engines, and even from that of the first engines of Mr. Watt.

134. The pump-rod *p* is suspended at the end A of the beam by another parallel motion, and the upper part S of the rod is made of cast-iron, and very massive, to have a sufficient weight in itself to draw up the piston, and make the returning stroke. The real pump-rod *p* is jointed to the heavy counter-weight S, and is polished, like the piston-rod *a*, that it may slide through a collar of leathers in the head of the pump Y, because the pump is of that kind called lifting force-pumps; its bucket raises the water in ascending, but it forces it through the air-vessel T, and pipe X, which leads to a reservoir two miles distant, in Hyde Park, and elevated 150 feet above the level of the water in the well where the pump draws from. This well has a communication with the river.

135. The cylinder Q is kept down by the weight of a pier of masonry, on which it is placed, and large iron bolts, *n*, descend from the lower stanch to the groundsills, upon which the masonry is built. Immediately before the pier is the condensing cistern M, which contains the air-pump N, the condenser L, partly concealed, and hot-well *g*, and is kept supplied with cold water by the cold-water pump I, worked by the beam at the outer end, and the waste runs off again into the well, so as to keep the water in the cistern always cold.

136. The valves, which must be opened and shut to produce the action of the engine, are four in number; viz. the upper steam-valve at F, the lower steam-valve O, and the exhaustion-valve K, fig. 2, and a small valve *l*, beneath the water in the cistern M, to admit the injection into the condenser: but these parts are better explained in fig. 2, which is a section of the cylinder, air-pump, and condenser on a double scale.

137. A, the section of the cylinder, in which the piston X moves; F, the steam-pipe coming from the boiler; L, the condenser; N, the air or discharging-pump; *m*, a passage or pipe from the pump L to the condenser N, in which passage is an occasional communication by a hanging-valve at *m*, which shuts towards the condenser; *l* is the injection-valve, to be lifted by the engine at every stroke, for the purpose of condensing the steam in the condenser L; *w* is the snifting or blowing-valve, placed outside the condensing cistern (of which MM is a section, on purpose to show the contents); the snifting-valve *w* communicates with the condenser by a pipe passing through the side of the cistern M, and is inserted at the side of the condenser; K is the exhaustion-valve, to be lifted by the engine, and open a communication between the cylinder A and the condenser L; O is the steam-valve, to be lifted by the engine, and open a communication between the lower part of the

cylinder, and upper part thereof, through the steam-pipe r ; and F is the upper steam valve of the same kind, opening a passage from the boiler to the top of the cylinder; and thence by the pipe r , and valves O , K , to all parts of the engine.

138. We must now attend to the mechanism by which the engine is made to feed itself, and perform its reciprocations. The valves are lifted by means of a lever applied to each, within the iron box in which it is contained, entering into an opening in the stem of the valve; and a second lever is fixed on the axis of the lever, on the outside of the box, to be connected with the levers and handles x , y , z , which open and shut the valves. There are three separate axles, or spindles, placed parallel and above one another, and each has a handle or spanner x , y , z , by which it is moved, either by the hand, to start the engine, or by the chocks on the plug-beam R , when the engine is in action. The two upper spindles, x and y , have short levers projecting from them towards the cylinder; and from each of these levers a rod is suspended, with a sufficient weight, o , at the lower end to turn round the spindle, each upon its axis, in that direction which will cause the handles, x and y , to fly upwards. Also the lower spindle has a lever projecting from it, away from the cylinder, with a heavy weight, n , fixed at the end; but this being applied, on the opposite side, to the weights of the two upper handles x , y , the weight, n , causes the handle, z , to descend. Both the axles of the lower handles, y , z , have small levers, or catches, 1 and 2, which act in the hooks of a double latch, or detent, $t v$, which is moveable upon a centre-pin situated between the two axles. The hooks of this detent are to detain the catches of the spindles, and prevent the handles $y z$ from moving by the action of their respective weights, until the detent is moved on its centre, so as to relieve the catches of the levers from its hooks t, v . But it is evident, from fig. A, that when only one catch, as 2, is hooked by the lower hook v of the detent, and consequently the weight of its spindle is held up, if the other catch, 1, is moved by depressing its handle y , so as to raise its weight in the act of entering the hook t of the detent, it will press the end t of the detent forwards upon its centre, and this at the same time pressing back the hook v , at the opposite end of the detent, releases the catch, z , of the lower handle, z , therefrom, and the weight n on that spindle immediately falls.

139. The spindle of the upper handle, x , is devoted to opening and shutting the upper steam-valve F , having a lever which communicates by a rod, 2, with the lever, 3, of that valve; so that by pressing down the handle x , it will shut the valve F . The weight o , which is applied to the upper spindle, tends to lift up the handle x , and open the valve F ; and, when the upper handle x is depressed, the valve will be shut; or, when the handle is suffered to fly up by the action of its weight, it will open the valve.

140. The second spindle, y , has a lever communicating with the lever of the exhausting-valve K , by a rod 4. The weight o , applied to this like the former, tends to lift up the handle y , and draw open the valve; but, when the handle

y is depressed, the valve is shut, and in this position the catch 1 is held down by the hook t of the detent, before explained, and retains the valve shut.

141. Lastly, the lower spindle, z , is for the lower steam-valve O , which is opened by the rod 14, when the handle z is suffered to fall down, and shut when the same is up, being held by the catch 2, and hook v . In all these the weight tends to open the valve; but, when the valve is to be kept shut, the detent holds the weight up. Now, by removing the detent, the weight falls and opens the valve in an instant.

142. The upper spindle has no detent to detain it; but what is equivalent is a rod, 5, jointed to that lever of the middle axis which has its weight and rod, o , suspended from it. The upper end of the rod, 5, is made with a loop, or long slit, in which works a pin at the end of a lever, 6, projecting from the upper axis towards the cylinder. The consequence of this is, that while the middle axis is detained by its catch, and detent t , to keep the exhausting-valve K shut, the lever 6 of the upper spindle will be borne up by its pin resting in the bottom of the loop of the rod 5, so as to keep the weight from opening the upper steam-valve F , as long as the exhausting-valve is kept shut; but when the catch, 1 t , of the middle axis is discharged, and its weight has opened the exhausting-valve, the looped rod, 5, will no longer support the lever, 6, of the upper axis, but allows its weight to descend and open the upper steam-valve; but at the same time the upper steam-valve, F , is not confined to be always open when the exhausting-valve, K , is open; for the upper steam-valve may be shut by depressing the upper handle x , without affecting the exhausting-valve at all, because the slit, or loop, in the top of the rod 5, allows that motion. This property must be attended to, because the action of the engine, by expansion, depends upon it. We have not before noticed the injection-valve, from which a long wire ascends, and is attached to a strap, 9, which winds upon the middle axis; therefore, when the middle handle, y , flies up by its weight, it winds the strap, and opens the injection-valve at the same instant that the exhausting-valve is opened.

143. The injection-valve, l , is placed to close the orifice at the end of a short curved pipe, which enters into the condenser and turns up; and the pipe has a cock in it, between the valve and the condenser, to cut off the communication, or to regulate the supply of injection when the valve is opened. This cock must be always shut when the engine is not at work, to prevent the condenser filling with water.

144. Suppose the fire lighted beneath the boiler G ; all the valves are kept shut by pressing down the two upper handles x and y , and lifting up the lower one, their respective catches detaining them in those positions, until the steam is sufficiently heated, and the engine is ready to work. In the quiescent position of the engine, when it is at rest, the counter-weight always draws the piston fully at the top of its cylinder, as in the figure; the air-pump bucket will also be at the top of its barrel.

145. In order to prepare for setting the engine to work, all the three valves must be opened at once. This is done by relieving the spindles from their several catches, when the weights immediately open the valves. The steam enters through the valve *F* into the top of the cylinder, and by the pipe *r* through the lower steam-valve *O*, into the bottom of the cylinder; also through the exhausting valve *K* into the condenser *L*, driving before it some air which passes out at the snifting-valve *w*. At first the coldness of the parts condenses all the steam which enters; and it is not until all the iron with which the steam comes in contact is heated to the temperature of boiling water, that the steam ceases to flow from the boiler in a stream, and be condensed as it arrives at the cylinder and condenser; but after this the steam acquires the same force in the cylinder and pipes that it has in the boiler; it then occupies every cavity and crevice of the engine, and in a little while displaces all the air in the cylinder, condenser, and pipes, which passes out, and is discharged at the snifting-valve *w*. This valve is always covered with water in a small cistern attached to the side of the large one to ensure its tightness. Through this valve the air is discharged by the steam, not at every stroke, as in Newcomen's engine, but only at first setting the engine to work, and this operation is called the blowing through. It is well known when the cylinder and other vessels are properly heated, and the air discharged, by a very smart crackling noise at that valve like a violent decrepitation of salt in the fire; this noise being occasioned by the water in the small cistern producing a sudden and rapid condensation of the issuing steam when the air is all gone.

146. It being known by this sign that all parts of the engine are cleared of air, all the three valves are to be shut by pressing and holding down the two upper handles *x*, *y*, and lifting up the lower handle *z*, in which situation its catch, 2, will retain it. This cuts off the farther supply of steam from the boiler, and also intercepts the passage of the steam from the cylinder to the condenser; and, as the cold surface of the condenser still continues to condense a considerable portion of steam, there will soon be none left, and a vacuum will be formed in the condenser, while the cylinder both above and below the piston is full of steam. The vacuum in the condenser will soon become perfect from the external cold alone, though more slowly than when an injection is made.

147. In this state the engine is prepared for starting at a moment's notice, by the engine-man letting the two upper handles, *x* and *y*, rise up, by their respective weights: this opens the upper steam-valve, and the exhausting and injection-valves; the former admits the steam into the top of the cylinder to press upon the piston; while the latter allows the steam, already in the lower part of the cylinder, to flow into the vacuum condenser; and at the same instant that he opens the injection-cock the valve is lifted at the same time with the exhausting-valve: this admits a jet of cold water into the condenser, and condenses the steam as fast as it arrives from the cylinder, so that in an instant all the steam in the lower

part of the cylinder will be drawn off and condensed. The pressure of the steam on the piston, being now unbalanced by any thing beneath the piston, it descends and draws up the pump-buckets and columns of water in the pumps, with a velocity proportioned to the pressure of the steam and the diameter of the piston, compared with the height of the column of water in the pumps, and the diameter of the bucket: but, the piston having descended about one-third of its stroke, a chock of the plug-frame *R* meets the upper handle *x*, and, pressing it down, shuts off the steam from the boiler. That part of the handle on which the chock acts becomes perpendicular when the valve is shut, the handle being bent for that purpose; and the chock can therefore descend farther, and slide against the perpendicular part of the handle, which is straight, without producing any farther depression of the handle, at the same time that it keeps it down to the same point, so as to hold the valve shut. The piston, therefore, continues its descent by the farther expansion of the quantity of steam at first let into the cylinder; but, having arrived at the bottom of its stroke, a chock on the opposite side of the plug-beam *R* seizes the middle handle *y*, and presses it down, which pushes the rod 4, until it shuts the exhausting-valve *K*, and also the injection-valve by the strap and rod 9. When the catch 1, of this handle *y*, presses on the upper hook *t*, of the detent *t v*, it relieves the catch 2, of the lower axle *z*, and then the weight *u* causes the handle *z* to fall, and, pulling the rod 14, opens the lower steam-valve *O*. Let us now consider the position of the engine; the middle handle *y* will be held down, by its catch 1 holding in the upper hook *t* of the detent so as to keep the exhausting-valve *K* shut; and the upper steam-valve *F* is also kept shut, by the same means which kept it shut during the latter two-thirds of the descent of the piston.

148. Under these circumstances the piston is at liberty to rise by the action of the counter-weight *S*, because the opening of the lower steam-valve *O* has established a free communication between the top and bottom of the cylinder, and the steam in the top of the cylinder can flow through the pipe *r*, and enter the bottom of the cylinder, as fast as the piston rises, by the action of the counter-weight.

149. When the piston has returned to within one-third of the top of the cylinder, the chock of the plug-frame quits the upper handle *x*; but this handle cannot yet be thrown up by its weight to open the upper valve, because the rod 5 from the lever of the middle axis bears up the short lever 6 of the upper axis *x*; and thus the motion continues till the piston arrives very nearly at the top of the cylinder: a chock on the plug-frame then seizes the lower handle *z*, and, lifting it up, shuts the lower steam-valve; and the catch 2 of the lower axis, passing the lower hook *v* of the detent, moves it on its centre so as to release the catch 1 of the middle axis from the upper hook *t* of the detent. This being the case, the weight of the middle axis causes its handle *y* to fly up, and by the rod 4 it opens the exhausting-valve; and, by drawing the strap and rod 9, it opens the injection-valve; at the same time the

upper axis x , losing the support of the rod 5 which kept it up, its weight carries up the upper handle x , and, by pulling the rod 2, it opens the upper steam-valve F .

150. The steam from the boiler is now admitted to press upon the upper surface of the piston, while the steam from the lower part of the cylinder beneath the piston rushes into the condenser, where, being met by the cold injection, it is condensed, and makes a vacuum in the lower part of the cylinder, which brings down the piston to make another stroke.

151. At one-third of the descent the plug-frame, as before, presses and holds down the upper handle x to keep the upper steam-valve shut; and, when the piston has arrived at the bottom, the plug-frame presses down the middle handle y to shut the injection and the exhausting-valves; and in catching, this discharges the lower axis, and the weight thereof opens the lower steam-valve. The piston then rises by the counter weight, and when at the top of its stroke the plug-frame lifts the lower handle z , and shuts the lower steam-valve; and, in catching, discharges the two other handles, which open the upper steam-valve, the exhausting-valve, and the injection-valve, and this produces the descent of the piston as before.

152. If the air has been fully discharged from all parts of the engine by blowing through, the action of the air-pump does not begin until the injection-water and the air, which are extricated from the water in the boiling, have accumulated in some quantity in the condenser; then at every descent of the bucket d of the air-pump it dips into the water contained in the bottom of the barrel N , and the water passes through the valves in the bucket: these valves shut when the bucket is drawn up, lifting all that water which is above them up to the top of the barrel, and there it is forced out through the hanging-valve g into the hot-well g . The drawing up of the bucket at the same time makes a vacuum in the pump-barrel beneath it; and if this vacuum is more perfect than that in the condenser, which it will be if the condenser contains either air or steam, it will press by its elasticity upon the surface of the water in the lower part of the condenser, and force it through the hanging-valve at m into the lower part of the barrel N of the air-pump; and, when all the water is gone from the condenser, the air or elastic vapor which is in the condenser will follow and enter into the pump until the space of the barrel beneath the bucket is filled equally with the condenser.

153. This takes place while the pump-bucket is at the top of its barrel; and on the descent of the bucket the space beneath it is diminished until it compresses this rarefied vapor so much, that its elasticity will be sufficient to close the hanging-valve m , and to lift the valves in the bucket d , and pass through them into the space of the barrel above the bucket: and, when the bucket has descended to the very lowest, the water contained in the bottom of the barrel, not being able to escape through m , must pass up through the valves, and rest upon the bucket d . When the bucket ascends it carries before it this water and air, and as it rises the space of the

barrel above the bucket diminishes, and the rare vapor or air in it condenses by being crowded into less space, until at last it becomes equally dense with the atmospheric air, and then the water following it drives it through the valve g into the open air.

154. The ascent of the bucket d left a vacuum beneath it as before, and this drew a portion of the air or vapor from the condenser into it ready to be extracted by the next stroke. As soon as the bucket begins to return the discharge-valve g shuts, and prevents the atmospheric air from entering into the pump. By this we see that, if the vapor in the condenser is so rare that the whole contents of the barrel of the pump will only make a few cubic inches, when reduced to become equal to the pressure of the atmosphere, this small quantity will be effectually evacuated through the discharge-valve g , because the water resting upon the bucket follows the air, and will chase every particle of it from the top of the pump, and then follow itself.

155. An effective and economical steam engine, imparting a primary rotatory motion, has long been a grand desideratum in the arts. The importance of such an invention will be apparent, when it is considered that, although the reciprocating steam engine (whether we look to the admirable expedients for adapting it to the end proposed, or to the skill displayed in the workmanship) appears to have reached its utmost degree of perfection, yet it absorbs half the power of the steam.

156. This fact may be proved by calculating what pressure on the pistons of reciprocating condensing engines is required to produce the declared powers. The results will prove generally to be only from six pounds to six pounds and a half per square inch, on the pistons of small power engines; seven pounds as to engines of from ten to thirty horse powers; and from seven pounds and a half to eight pounds as to engines of larger powers; when the actual pressure of the steam is at least seventeen pounds per square inch above a vacuum. When the engine is in the best possible working state, these results will be a little more; but this state is seldom long maintained; therefore they may be taken as a fair average. This serious loss of power is occasioned principally by friction, and in alternating the movements of the parts. Now to obviate these defects, a variety of rotatory steam engines have been suggested. These may be examined nearly in the order of their invention, commencing with that invented by Mr. Masterman:—

157. Plate XII., fig. 1, represents a vertical and central section of the troke (being that part of the engine which revolves). Fig. 2 is a transverse section of it, and of the two masks after mentioned. The troke is composed of the axis, of the nucleus (being the central part, and through which the axis passes); of the annulus (being a hollow ring, in which are placed valves), and of the radii (being the steam passages between the nucleus and the annulus). Fig. 3 is a plan of the nucleus. That part of it which is included between the two concentric circles is called the face. The surface of the face is a

STEAM ENGINE.

MASTERS' ROTATORY STEAM ENGINE.

Fig. 1. 1. 2. 3. 4. 5. 6. 7. 8. 9. 10. 11. 12. 13. 14. 15. 16. 17. 18. 19. 20. 21. 22. 23. 24. 25. 26. 27. 28. 29. 30. 31. 32. 33. 34. 35. 36. 37. 38. 39. 40. 41. 42. 43. 44. 45. 46. 47. 48. 49. 50.

perfect plane. The axis passes through the hole 1 at right angles with the plane of the face. Six holes 2, of similar figure and dimensions with each other, are sunk in the face at equal distances, in a direction parallel to the axis, for three or four inches; then, curving into a direction at right angles with the axis, they open in the periphery of the nucleus.

158. The annulus A consists of six equal segments. At each of their joints is fixed a valve, which, by being ground on its seat, is rendered steam-tight when closed.

159. The radii 1, 2, 3, 4, 5, 6, are connected with the nucleus and annulus, so as to form steam-tight communications between each hole in the face, and the inside of the annulus.

160. Fig. 4 is a plan of the inner mask, being a circular plate of metal, of equal diameter with the face, about two inches thick, and having each side perfect planes, parallel to each other.

161. There are four holes 1, 2, 3, 4, through 1 is of sufficient size to admit the axis; 2, 3, 4, are each one-sixth of the space that would be included by completing the two concentric circles, segments of which form the sides of those holes; and those circles are described with the same radii as the segments of those which bound the holes in the face. Thus, each of those holes would extend over one of the holes in the face, and one of the adjoining spaces. The space between 2 and 3 is of such dimensions as just to cover completely one of the holes in the face; 4 is situated so as to leave equal spaces between it and 2 and 3.

162. The periphery of this mask is clasped by an iron hoop, from which projects a lever, extending nearly to the annulus, and having a small inclined bar placed across its end. The two projections from fig. 4 represent the beginning of the lever; and the whole of it, with the hoop, is represented by the dotted lines *m* in fig. 1.

163. Fig. 5 is a plan of the inner side of the outer mask. Fig. 6 is a plan of its outer side. This mask is a circular piece of metal of the same diameter, and about the same thickness, as the inner mask. The inner side, fig. 5, is a perfect plane; 1 is a hole sufficiently large to admit the axis; 2, 3, 4 (see fig. 6), are pipes which enter the outer side of this mask, and open in its inner side. The apertures are represented by the three smaller circles in fig. 5. 2 is the pipe through which the steam passes from the boiler to the engine. 3 is the eduction pipe, through which the steam is discharged from the engine into the condenser, or (where one is not used) into the air. 4 is a pipe through which any waste or excess of water in the annulus may be supplied or withdrawn; it is kept closed by a stop-cock while the engine is at work. The axis passes through 1 in both masks; the inner mask is placed next the face, the other next the inner mask, and both are kept closely pressed towards the face (by means of screws acting on the back of the outer mask) so as to be steam-tight with each other, and with the face; a trifling pressure suffices to make them so, the opposed surfaces having been ground on each other. The outer mask is placed in such a position, with respect to fig. 1, as that the pipes 2 and 3 may

be horizontal, and point towards radius 2 (it appears in this relative position in fig. 6), and it always remains stationary. The inner mask is placed in such a position, with respect to the outer mask, as that pipes 2, 3, 4, in the latter may communicate with the holes of corresponding numbers in the former, and thus form a communication between the pipes in the outer mask and the face. It appears in this relative position in fig. 4.

164. Thus the holes in the inner mask are for the same relative purposes as the pipes in the outer mask marked with corresponding numbers.

165. The inner mask is moveable by means of *m*, but so far only as not to interrupt the communication between 2 and 3 in the outer mask and the face.

166. The transverse sections of both masks, placed in their relative positions, are represented in fig. 2.

167. The corresponding letters in figs. 1 and 2 refer to the corresponding parts in each figure; *p p* is the axis; *g, g*, are its bearings; *r* is a crank attached to the end of the axis, for working the feeding pump, and (where a condenser is used) the air-pump. As the valves, and the gear for regulating them, are precisely the same in each segment of the annulus, only two of them (one showing their position closed, the other open) are lettered for reference.

168. Each valve *f* is similar to the other, and opens in the same direction; its gudgeons moving freely in sockets fixed to the sides of the annulus nearest the axis.

169. Their working gear is as follows:—*a* is a small hollow protuberance, or bonnet, screwed on the annulus and communicating with the inside of it; on one of its inner sides is a socket, on the opposite side a stuffing box; one end of a spindle works in the socket, the other passes through the stuffing box to the outside of the bonnet; to this end is attached the lever *b*, and to the centre is attached the lever *c*, both levers being at right angles with the spindle and in the opposite direction to each other. To the extremity of *c* is attached, by a moveable joint, the rod *d*, and to the extremity of *b* is fixed the weight *e*, being more than sufficient to counterpoise *f*, which is connected with it by means of a moveable joint at the other end of *d* and attached to the centre of *f*. The levers are so placed as to cause *f* to be half open when they point to the axis. Thus it is evident that during the revolutions of the crank, two of the valves *f* on its ascending side, denoted by the arrow, will by the mere preponderance of *e* be shut, and the whole of the others will be open, as represented in fig. 1.

170. For more easily comprehending the action of these valves, let it be considered that their movements are regulated by the mere gravity of *e*. It will be afterwards shown that they are regulated with more precision by means of the catch *h* and lever *m*. Let it also for the present be considered that there are no valves *i*, nor lever *k*, their use will afterwards be detailed. The machinery to which motion is to be imparted is attached to that end of the axis next fig. 1.

171. The steam is generated and condensed in the usual manner.

172. The principle on which the engine acts is by a liquid body, water or mercury for instance, placed in the annulus being pressed on one side of the troke by the steam, until that side gain such a preponderance over the other as to overcome the resistance of the machinery attached to the axis; and by being then sustained there, so as to maintain the preponderance during the revolutions of the troke.

173. The engine represented by the plate is one in which water is the liquid made use of in the annulus.

174. The manner in which it is worked is as follows:—The annulus is nearly half filled with water, which need never be withdrawn. The troke is placed so as to have two of its radii in a vertical position: m is then depressed so as to cause 2 in the inner mask to communicate with the lowest hole in the face. The steam cock is now turned, consequently the steam rushes through the pipe and hole 2 in the outer and inner masks, and through the lowest hole in the face, into the lowest radius; and, after imparting to the surface of the water in that radius its own temperature, it presses such water downwards, and flows into the annulus, condensing in the water therein, until it has imparted to it also its own temperature, which will be rapidly accomplished. On the temperatures becoming alike, the steam will rise through the water on both sides of the troke; and meeting with a closed valve on one side will press the water, which is beneath it, downwards, and consequently cause the water on the other side to rise proportionably, until the preponderance thus given to that side be sufficient to overcome the resistance of the machinery attached to the axis. Immediately whereupon the troke will begin to revolve,— m must now be returned to its working position; that is, such a position as will elevate the hole 2 so high as to cause the steam to flow into the annulus, just above the depressed surface of the water (ascertained by the pressure of steam).

175. The load or resistance of the machinery remaining the same, and the supply of steam being equable, the water will remain nearly stationary during the revolutions of the troke: its surfaces are denoted by the dotted lines at n and o .

176. As the troke revolves, each of the holes in the face communicates in succession with 2 in the inner mask. It should be borne in mind that, as has before been observed, the position of the inner mask is never so far changed as to prevent 2 and 3 therein communicating with the corresponding pipes in the outer mask, when the engine is at work.

177. By the construction one entire hole in the face, or parts of two equal to one, is or are always in communication with 2 in the inner and outer masks; so that there is always an equable flow of steam into the annulus, preventing the depressed surface of the water rising with the ascending closed valve.

178. The holes in the face, as they pass in succession from 2 to 3 in the inner mask, are

entirely closed by the space between them; and, immediately on communicating with 3, the steam confined between the two closed valves rushes from the annulus, through 3, into the air; or into the condenser, if one be used. And, until the same hole in the face has passed 3, a communication with the air, or the condenser, remains for the discharge of the steam.

179. The pressure of the steam being thus removed from each valve f , as it arrives at this point, it will, by the gravity of e , open as it begins to descend (see the valve f partly open in fig. 1), and thus allow the column of water to remain on that side of the troke.

180. The water will fill the radii as their ends descend beneath the elevated surface o , and will remain there until the steam presses it out at about n ; but cannot escape if before it enters them the hole in the face has passed the hole 3: otherwise, however, the water would escape through that hole into the air or condenser.

181. A uniform rotatory motion is thus produced and maintained, as long as the steam flows equably into the annulus, acting with a force proportionate to the preponderance of the water on one side of the troke over the other. This force is easily estimated; being equal to the weight of a perpendicular column of water, having the difference of the two levels for its altitude, and the area of a transverse section of the annulus for its base, pressing against the closed valve.

182. Having thus described the action of the engine without the catches h , or the valves i , it is now necessary to describe them. The projection g is cast with a ; h is attached to one side of this projection by a pin, which is the fulcrum on which it moves: it is prevented swinging to an angle of more than about 20° by the shoulders pn it, near its round end; this end is much thicker than the other end, and more than sufficiently heavy to counterpoise it. Near the extremity of its thin end is fixed a pin of about four inches long. Another pin of about the same length is fixed on b within e ; those two pins project from h and b at right angles, as seen in the figure, and point, the first towards the eye, the second in the opposite direction. The pin on b rests in the notch at the thin end of h when just below m , and thus prevents e acting on f ; but as the catch passes m the pin on h comes in contact with the bottom of the inclined bar on m , and before it has passed the top of it, is pressed so far towards the annulus as to release the pin on b from the notch, when e immediately falls and f closes. The superior gravity of the round end of h keeps the notch back, or towards the annulus, while that part of the troke is descending, and brings it forward so as to support the pin on b , when it begins to ascend.

183. When the engine is working with its heaviest load, the depressed surface of the water will be as near the bottom of the annulus as it can be, without affording a passage for the steam to the other side of the troke; and the lighter the load the farther from the bottom will it be. Now it is most beneficial, both for f to close and the steam to enter into the annulus, above such depressed surface; as otherwise the speed

of the engine would be impeded, and the surface of the water agitated; but were the valves f to close, and the steam to enter the annulus always at one spot, either this disadvantage would occur when the engine should be working with a light load, or the column of water must be limited, or part of the water must be withdrawn from the annulus.

184. It is evident that any alteration in the position of m changes the closing point of f , by varying the point of contact of the pin on h with the inclined bar on m . It is also evident that any alteration in the position of the inner mask, in like manner, varies the point at which the steam is admitted into the annulus.

185. Before the clasp round the inner mask is screwed up, the following adjustment must be made:—Let a hole in the face (that communicating with radius 2 for instance) be covered by the space between 2 and 3 in the inner mask. The situation of f immediately below that radius will be the most beneficial point relatively to the then position of this mask, where the valves f ought to be closed. Because the covered hole immediately afterwards communicates with the eduction hole 3, and consequently, were they not then closed, the steam entering radius 1 would, until they closed, be lost by passing out through radius 2, without having exerted its force; and, were they closed lower than at the arrow, that is, when any considerable portion of steam should be entering through radius 2, they would be pressed open again; m ought therefore to be placed in such a direction as to cause f to close at this point. And this direction will be nearly that in which m appears in the plate. The clasp is then screwed so tight, by means of the screws and nuts represented in fig. 4, as to cause the position of the inner mask to be altered by any movement of m .

186. After this adjustment, one simple movement of m will not only cause the steam to enter the annulus above the depressed surface of the water, but will also cause the valves f to close at the most beneficial point relatively to such entrance of the steam. There could be no difficulty in causing the steam to regulate this movement by its pressure on a small piston connected with lever m .

187. Where the load is constant, the inner mask, the lever m , and the catch apparatus, might be dispensed with, by making the apertures in the outer mask of the same form and size as those represented in the inner mask, and by leaving the action of the valves f to be regulated by the gravity of c ; and, where fuel is cheap, the valves i might also be dispensed with; thus diminishing the expense of the construction and repairs of the engine, and simplifying it.

188. The only use of valves i is to prevent the water entering the radii at o . Their construction and action are as follows:—That end of each radius which enters the annulus has a flanch of about an inch broad; against this i closes. The gudgeons of i work freely in sockets screwed to the flanch.

189. Lever k is attached to lever c by the rod appearing to connect them in the plate, which is as a moveable joint at each end. A pin passes

through the centre of k , and through the notched end of the small projection appearing fixed to the annulus, which consequently forms a fulcrum for it. As the valve f (represented partly open) begins to open, the extremity of k presses against the back of i until its gravity causes it to shut. Its gravity keeps it shut until it has descended below the horizontal line; when the pressure of the water prevents its opening, until the steam, entering through its radius, presses it open.

190. l is a bonnet screwed to the annulus, by which access is procured to the valves for repairing them. The troke is constructed of cast metal, except the valves and inner mask (which are of brass, where mercury is not used), and the valve gear inside the annulus, which is of wrought iron.

191. The troke is enclosed in a case of stone, or brick, for the purpose of preventing condensation when at work, and the cooling of the water when at rest, by confining the heated air next its surface. And, further to delay the latter, evaporation is prevented by closing valves in the steam and eduction pipes. With these precautions the water would remain until the next day at a very few degrees below the boiling point, and consequently the engine in an immediate working state. Where a condenser is not used, fuel is saved, by causing the steam from the eduction pipe to impart its heat to the water from which the boiler is supplied.

193. The diameter of the troke ought never to be less than twenty-eight feet, as the engine could not be worked economically with steam of a less pressure than about ten pounds per square inch; but this diameter need never be increased, as the power required may be gained by enlarging the annulus. In large powers, however, it would be found advantageous to increase the diameter of the troke.

194. In the plate the annulus is circular, but in larger powers it would assume the form of a square, and in still larger powers that of an oblong; so that the breadth of the valves from their gudgeons should never exceed about eighteen inches, on account of the advantage of limiting their action.

195. Where mercury is used, instead of water, the engine differs not in construction or principle; but the diameter of the troke need not exceed six feet for any power; the great specific gravity of the mercury giving the requisite pressure to the steam by a column of about thirty inches: and the transverse section of the annulus ought always to be an oblong, that form requiring less mercury. Several parts may, however, be omitted; for instance the valves i ; because, with a column of thirty inches, the radii descend to the horizontal line before their ends reach the surface of the mercury, and its temperature would be throughout alike. Also the inner mask (the outer mask being made to assume its form as before mentioned), because, the closing point of the valves need never be altered, so short a column (comparatively with the diameter of the troke) allowing the steam to enter the annulus nearly as high as the horizontal line of the radii, without causing a radius

to descend into the mercury before its communication be cut off from hole 3. And for the same reason the radii may be reduced in number to five or even four. The pipe 4 may also be omitted, there being no waste of the mercury.

196. Instead of the case before mentioned, the troke, with its mask, may be enclosed in a steam-tight cast iron case, and the steam being admitted into it in the first instance, all condensation of steam within the annulus is prevented. This it is advisable to effect, on account of the difficulty of getting rid of the water, which would accumulate on the depressed surface of the mercury. This water, however, may, when necessary, be blown out by the steam into the air through a pipe of about a foot long, inserted into that side of the annulus next the axis, and having a stop-cock in it; and a common case may then be made use of.

197. It will be perceived that where mercury is used, the engine is exceedingly compact; but, where space is very limited, the troke may be made to revolve in the boiler itself, by having a projection on its top; and this is the more economical mode.

198. A patent has been taken out for another rotatory engine that possesses considerable merit. It may be thus described:—A piston is made to revolve in an annular channel, or hollow ring, formed between two concentric horizontal cylinders; into which channel two sliders pass from opposite sides of its diameter alternately, so as to form in it steam-tight partitions that constitute abutments, to resist the steam at the end of the portion of the channel, in which it is forcing round the piston, and which are by the external machinery drawn out of the track of the piston, whenever it approaches them.

199. To communicate the motion of the piston to the mill work on which the engine is intended to act, the internal cylinder is divided transversely in the centre into two equal parts, between which a circular vertical disk is placed, to the edge of which the middle of the side of the piston next to it is united; and an axle passing through the centre of this disk, and through the entire of the internal cylinder in the line of its axis, being made fast to it, the circular motion of the piston is by it communicated to this axle, which in its turn acts on the mill work. The end plates of the outer cylinder form each one piece with one of the halves of the internal cylinder, and, by being ground into rebates in the ends of the cylinder, make with it steam-tight junctures, which are closely pressed together by means of flanches formed in the end plates, and in the cylinder, connected by screws and nuts.

200. The circular disk to which the piston is attached is made steam-tight at its sides, by rings that lie in grooves formed in them, which are pressed against the adjoining divisions of the internal cylinder by hemp packing placed between them and the disk; and the piston itself, which is of a rectangular form, is made steam-tight at its edges by a metallic packing, behind which hemp packing is also placed, which metallic packing consists of four pieces

in the form of the letter L, the longer portions of which lie along the two principal edges of the piston, while the shorter portions meet in the middle of its ends; the longer pieces at the outer edge of the piston meet in the middle, but those at its inner edge, next the centre, are separated by the disk with which they are made to form secure junctures, by portions of them being bent round into its direction, and entering into cavities made for them in its substance. Where the ends of these pieces of metallic packing meet, part of their external surface is cut away, to admit plates to be placed across their lines of juncture to prevent the steam from passing between them; and spiral springs being fixed in several places between these pieces and a piece in the centre of the piston force them out against the sides and ends of the two concentric cylinders; while flat plates at each side of them, that are nearly equal in size to the transverse diameter of the channel, and which are united by screws to the central piece of the piston, keep them in their places, and along with them and the central piece constitute the piston.

201. The packing pieces and the side plates being ground, where they come in contact, the former easily slide between the latter on being pressed by the springs, and at the same time maintain their joinings steam-tight; and the screws which unite the plates to the central piece, being made of the same metal with them, expand or contract equally with them on alterations of temperature, which prevents any of that contraction that might be occasioned from difference of expansion, were the parts made of different metals.

202. The sliders move vertically in grooves made for them in the end plates, and enter into other grooves cut lengthways for them on the face of the internal cylinder; they of course pass through the sides of the external cylinder, and are there received into steam-tight cases; through the ends of which that are farthest from the centre, rods, like piston rods, pass from their middles through stuffing boxes; the outer ends of these rods are fastened to the centre of horizontal bars that extend a little beyond the ends of the main cylinder, and are there jointed to vertical pieces that terminate in forks; between which are placed vertical rollers, against which the edges of cam wheels act that are attached to the main axle, by which they are moved up and down so as to close or open the channel in which the piston moves, as required; while two other rollers, placed at the sides of the forks externally, serve to guide them between upright bars, placed for that purpose, and keep them from being made to deviate to either side by the pressure of the cam. The upper slide is moved upwards by the cam wheel, and descends by its own weight; but the lower one, which lies directly under it at the other side of the main cylinder, is pressed downwards by the cam, and rises up again by the action of a balance lever placed beneath it, to the farther end of which a weight is appended. The rod by which each slider is worked is fastened to it by the intervention of a narrow bar that is dove-tailed to the outer edge of the slider, to the centre of which bar the rod

is rivetted or screwed. The longest radius of the cam wheel by which the sliders are worked is nearly equal in length to the radius of the outer cylinder, and its shortest radius is, by the depth of the annular channel in which the piston moves, so much less in length than this. The sliders themselves are made steam-tight in the grooves by grinding; and in the part of the edge of the central disk, against which they press when closed, sloped notches are made, which, as the disk revolves, gently elevate them to its edge, and thus, in the opinion of the patentee, prevent sudden percussion.

203. For the admission of the steam into the annular channel an aperture is made through each of the end plates near the entrance of the sliders; and diametrically opposite to them two other apertures are made in the same plates, for the eduction of the steam from the portion of the annular channel which is being emptied, either into a condenser or into the open air. These apertures are covered with circular valves, ground on their beds to make them steam-tight, and which turn round on their centres; in these circular valves perforations are made of the same size of the other apertures mentioned, which, when turned round over them, permit the steam to pass; but, when turned in the opposite position, totally close the passages, by the solid parts of their plates being then brought round over the apertures so as to cover them completely. These circular valves are placed in bonnets, or boxes, which are screwed to the end plates over the apertures; and axles pass from their centres through stuffing boxes, in the covers of these boxes, by which they are turned round by arms that project from them at right angles, and which are jointed to a frame that connects the two of them together, which arc on each end plate at opposite sides of its diameter; through the middle of which frame the axle passes, carrying on it a pointed cam wheel, which acts against friction rollers, attached to the joints that connect the arms with the frame; by which arrangement the circular valves are made to turn in opposite directions; so that when one is opened to let the steam enter at the upper part of the annular channel, that which lets it pass to the lower part of this channel is closed; and, in like manner, when the circular valve is closed, through which the steam passes out at the other end plate of the cylinder, that at the opposite extremity of this plate is opened, to afford a free passage to the steam from the other side of the channel, either to the condenser or to the open air.

204. Supposing then the piston to be near the upper aperture for the admission of steam, the slider behind it being then let down by the cam which moves it, the steam will press forward, while that which remained at the other side of the piston in the channel, passes out at the aperture at the lower part of the other end plate, until the piston approaches near to it; when it is immediately closed by the action of the cam on its valve, and at the same time the lower slider is pressed downwards, out of the way of the piston by its cam; the piston directly after passes by this lower aperture, and

the lower slider, and also by the second lower aperture, close to the other side of the lower slider, by which the steam is admitted to the lower portion of the channel; immediately after which the lower slider is closed, and the lower steam valve and the upper eduction valve are opened; when the steam presses the piston round upwards, until it comes nearly to the upper slider, and to the steam valve, and eduction valves at its opposite sides, which are managed in the same manner as the lower valves and lower slider just described; by which means the piston passes them in a similar manner, and is again urged forwards by the steam as at first.

205. In front of the engine, on a level with the axle, a box is fixed to the frame-work, by which the whole engine is supported, into which box the steam enters by a pipe from the boiler, and passes from it horizontally through tubes concealed in the frame-work, round into passages made in one of the end plates which convey it to the valves; while similar passages in the other end plate convey the steam off from before the piston through the eduction valves, and round through similar tubes into another division of the same box, whence a pipe passes either to the condenser or to the open air; and a common sliding valve is so placed in the box that by shifting its position, by an external handle, the steam will pass into those tubes which before served for the eduction; and, on the contrary, those tubes through which the steam before passed will then convey it away to the division of the box whence the pipe proceeds to the condenser or to the open air. The precise mode of arranging the sliding valve, and the divisions in this box is not detailed in the specification, but may be easily conceived by those conversant with the subject; by the means however mentioned, the direction of the progress of the piston will be reversed, and the engine be made to turn in a course contrary to its former movement: which contrivance would be particularly useful in working gins for raising coals from the pits, and other similar purposes; and would also be occasionally of use when the rotary engine was employed in steam vessels.

206. The patentee explains the term, 'improved rotary steam engine,' in the title, to mean *improvements* in rotary steam engines, and enumerates the following particulars in the engine described as coming under that head, and accordingly claims them as his sole property by authority of his patent. 1st, the annular grooves in the faces of the divisions of the internal cylinder next the central revolving disk, which receive the packing rings that make that juncture steam-tight: 2d, the notches in the edge of the disk, which receive the ends of the sliders, and cause them to be gently elevated to its circumference: 3d, the combined packing of metallic pieces and hemp used with the piston and the central disk, which the patentee calls 'compensating packing': 4th, the circular valves for closing the apertures through which the steam passes into and from the annular channel in which the piston moves: and, 5th, the friction rollers at the ends of the rods of the apparatus.

for moving the sliders, against which rollers the cam wheels act.

207. The next rotary engine which it may be necessary to describe was invented by Mr. Eve. It formed the subject of a patent, and the specification will scarcely admit of abbreviation. The patentee says, 'I, the said Joseph Eve, do hereby declare that the nature of my said improved steam-engine consists of five particulars. 1st, In the application of revolving cones to rotary engines, in the manner hereinafter described, for the purpose of compensating any loss by friction; and in the general arrangement of the various parts of the rotary engine hereinafter described. 2d, In a steam-generator, so constructed of tubes that the heat of the furnace shall cause the water to circulate constantly through the tubes, thereby preventing the steam from driving the water out of them, by which means the said tubes are less liable to burn out or become oxidated. 3d, In an arrangement of one or more revolving cock or cocks, for the purpose of supplying the generator with water in lieu of the ordinary forcing pump. 4th, In a new safety apparatus, by which the elasticity of steam in boilers is ascertained by weight directly applied instead of indirectly, as in the ordinary steelyard valve. And, 5th, In such an arrangement of cog wheels with a compound engine, in such manner that the steam, after having acted as high pressure, may be used as low pressure with greater effect than in any engine now in use. And, in further compliance with the said proviso, I, the said Joseph Eve, do hereby describe the manner in which my said invention is to be performed by the following mechanical description of the various improvements constituting the same, reference being had to the drawings annexed, and to the figures and letters marked thereon (that is to say):—Sheet first contains three modes of constructing my rotary steam-engine. Fig. 1, plate V., STEAM-ENGINE, presents an end section. Fig. 2, a longitudinal section of the same engine, on the simplest manner of construction. The same letters refer to similar parts in all the figures. In sheet the first, *a*, *a*, are the cylinder and cone revolving in contact in opposite directions, the cone having one groove, and being one-third of the diameter of the cylinder, which latter has three wings or pistons, *c*, *c*, *c*, the ends of which, as they revolve, touch the outer case *e*, and do not admit any steam to pass. The steam is admitted through the pipe *f*, and, acting on the wing *c*, causes the cylinder to revolve until the said wing passes the pipe *c*, where the stratum of steam lodged between each two wings is allowed to escape; the wing which has thus passed falls into the groove *d* of the cone, the bottom of which groove it touches in passing, thus allowing no steam to escape between. The said wing *c* then passes again by the steam-pipe *f*, and is acted upon as before described, and so on in rotation. The cylinder *a*, which is firmly fixed to its axis *b*, rests on one side, on the outer case *e*, through which the axis projects; but as there is some friction produced by the revolution of the said cylinder at its two ends, touching the outer case, I have placed a false end, *h h*, under the other

site end of the cylinder, which false end slides on the axis *b* freely, and has a thread out at the end; by means of which, and the adjusting nut *i*, the cylinder, if worn at the two ends, can be easily tightened and adjusted. The adjusting nut is confined by the collar *k*, which collar is screwed to the outer case. The conical shape of the small runner, which can likewise be moved upwards or downwards in the outer case, serves to keep the two convex surfaces of the cylinder and cone in contact, so that no steam can escape between them. It is obvious, from the conical shape of the runner, that the longer the engine will be in use the better it will work, and the more steam-tight it will become. By referring to fig. 3, which presents a longitudinal view of the conical runner, it will be seen that the groove *d* is cut into a separate piece of metal, which slides by an adjusting screw up and down in the empty space *x*, so that when the engine is adjusted, the groove, or the piece of metal into which the said groove is cut, can be moved up and down so as to fit the wings of the cylinder by means of the adjusting screw *o*, as exhibited in this and in fig. 4, which latter figure presents an end view of the before described cone. The dotted lines in the said fig. 4 show the appearance of the sliding piece containing the groove. Letters *n*, *n*, in fig. 11, present two cog wheels, running into each other, attached on the outside of the engine to the axis of the cylinder and cone, placed there for the purpose of producing a corresponding revolution of the said cylinder and cone, causing the groove of the cone to present itself regularly to the wings of the cylinder. *o* is a pinion, fixed to the other end of the axis, by means of which any machinery can be put into motion. Another variety of constituting a steam-engine on my principle is shown by an end section view in fig. 5, and an external view in fig. 6. This engine has a cylinder with three rings and two small conical runners on each side; said conical runners being of the same construction as in fig. 3, represented with one groove cut into each, and of one-third of the diameter of the cylinder. There are two induction and two education steam-pipes; and although the engine may be, with the exception of the addition of one of the conical runners, exactly of the same size as the one first described, a double quantity of steam is requisite, and twice the power of the former engine is gained. The steam enters through pipe *f a*, and acts on the wing *c*, which, after having passed pipe *c a*, where the steam escapes, falls into the groove *d* of the lower cone, and appearing at the induction steam-pipe *r b*, is loaded again with steam pressure, which it discharges at the second education pipe *c b*, and then enters the groove of the upper cone; after having passed which it is loaded again at the first mentioned induction pipe. Letters *m, m, m*, in fig. 6, are bridges by which the spindles, *b, b, b*, of the cylinders and cones are supported. I have represented six bridges in the drawing, but two bridges on each end, and supporting the three spindles or axes, will answer as well, or any other contrivance to support them properly. This engine has three cog wheels, *n, n, n*, attached to the three spindles so as to cause the

cylinder and cones to revolve in unison, and, like the first described engine, a pinion *o*, on the opposite end of the axis of the cylinder. Fig. 7 shows an end section view, and fig. 8 a longitudinal section. Figs. 12 and 13 two external views of an engine which I have constructed upon a different plan, without altering any of the leading principles of the two engines heretofore described. The same letters already explained apply likewise to the last mentioned figures. The two conical runners in this engine are of an equal length and diameter; each has two wings or pistons attached, and two grooves cut into it, and in revolving in opposite directions, the wing of one runner falls alternately into the groove of the other. The steam enters by pipe *r*, and as the cylinders are running in contact, it cannot escape between them, but acts upon the two wings in an opposite direction, and escapes at the eduction pipe *c*, after the said wings have passed the same. By reference to fig. 8, which represents the longitudinal section, it will be seen that the two cones have each two false ends, *h, h, h, h*, sliding freely on their spindles; the two outer cases, *ε, ε*, fit over the runners and their wings exactly. Each of the four false ends has an adjusting nut, by which the engine is tightened if steam escape, or slackened if it run too tight. Each pair of the false ends, where they join, have a plate that connects them and breaks their joint so as to prevent escape of steam. This plate *p* slides into the groove *r*, cut out of the false ends, as exhibited by figs. 10 and 11, the former showing an end view of the false ends, with the connecting plate in the middle; the latter figure, 11, exhibiting a longitudinal view of the said false ends or bottoms. On these false ends packing rings, *q, q, q*, which are confined to the sliding plate, as exhibited in fig. 9, are placed; these rings press against the hollow outer case, and prevent any steam escaping by them. These packing rings are shown in section, in fig. 8. It will be evident that the false ends need not be made true if the connecting plates and packing rings, as above-described, are adopted; and that the engine, if provided with moveable false ends, conical runners, and the afore-described connecting plates and packing rings attached, as shown in fig. 8, can always be kept steam-tight; and by use the various parts on which there is any friction will fit better. Sheet second, figs. 5', 6', 7', and 8', exhibit various views of my said second particular, and which I call my circulatory tubular steam-generator; as also of my said third particular, being an arrangement of two revolving cocks to supply the waste of water in lieu of the forcing pump. Fig. 5' is a side view, fig. 6' a front view, fig. 8' a back view of the said generator. The same letters apply to all the figures. *A* is the lower conduit pipe: *B* the steam receiver: *C, C*, are two pipes in which the water descends from the steam receiver to the lower or conduit pipe: *D* is the dome connected with the steam receiver, from which dome the steam enters into the steam-pipe *F*, and into pipe *E*, which latter leads to the safety apparatus: *G, G, G, G, G, G, G, G, G, G*, are ten pipes which communicate with the lower conduit pipe and the upper pipe or steam re-

ceiver. Fig. 7' presents one of these ten sections in front, and the manner in which they are formed, and bent, and connected, with the two horizontal pipes, which latter are shown in section in this figure: *h* and *i* are two valves, the former kept open by its own weight, and the latter floating; with these two valves every section of pipes is provided at its two orifices, where they communicate, with the lower conduit and steam receiving pipe: *p* is the grate and fireplace, over the middle of which the smaller combination of pipes are placed: *o, o*, is the ash-pit: *Q* is an end which screws into the lower conduit pipe, by means of which the same may be cleaned out when necessary; the number of sections, number of pipes composing each section, and the manner in which the pipes are bent, is arbitrary. The generator or boiler is fed with water through the orifice *o*. In fig. 5' each of the two horizontal tubes or pipes is shown as composed of two pieces in my drawings, and united by means of their flanges and bolts and screws; they may, however, be cast in one piece of metal. The heat of the furnace will cause the water to circulate constantly through the tubes, thereby preventing the steam from driving the water out of them, and by which means they are in a great degree prevented from burning out or oxidating. My tubes, in the sections, are from one-eighth to one-fourth of an inch thick, and one and two inches diameter; they may be of copper, iron, or any other metal which is sufficiently strong to bear the pressure. This pressure will be comparatively small on account of the small size of the pipes, although steam of the highest pressure be used. My horizontal pipes are an inch and a quarter thick, and nine inches and a half diameter; the vertical pipes three-fourths of an inch thick, and four inches and a half diameter. The valves *h* and *i*, attached to the orifices of each of the section pipes where they enter into the horizontal tubes, are placed there in case of a rupture in one of the sections to which they belong, in which case the unbalanced pressure of steam would force the water so rapidly into the particular section that was ruptured, as to cause the valves to close, thereby preventing any waste of steam, and detaching the ruptured section from the rest of the generator, whereby the engine need not be stopped, but would only lose so much of its power as the proportion of one section to the remaining sound ones would be. The two large vertical, as well as the two large horizontal tubes, are imbedded in brick-work, and the sections only are exposed to the heat of the fire; therefore no steam will be found or generated in the former, while the action of the fire will cause the steam and water to ascend rapidly through the small pipes into the steam receiver, while the water in the steam receiver, being heavier than the water combined with steam in the smaller pipes, will descend through the vertical tubes into the lower conduit tube, thereby causing a continual circulation through all the tubes, great and small. The steam will of course accumulate at the top, and through the dome find its way to the steam-pipe and safety-apparatus. In case the circulation should be too rapid, and to prevent the possibility of the water

being forced into the steam-pipe before it descends again through the vertical pipes, I have placed a piece of sheet iron, perforated with small holes, similar to a strainer, in the middle of the steam receiver, all across from end to end, shown by a line across in the drawing, in fig. 7'. I have given to the small pipes in the sections the peculiar serpentine form, in order to enable the steam to rise to the top more rapidly than the water. My generators or boilers are supplied with water by means of one or more revolving cocks, to serve in lieu of the forcing pump, as shown in sheet second, fig. 8', where two cocks are represented, and which number I prefer: *n* is a vessel, filled with water, of any convenient shape, one side of which vessel is near the furnace, so as to keep the water warm. This vessel is connected with the generator through a tube entering at *o*, which is shown in section in the drawing. This tube has two revolving cocks, *k* and *l*, with a chamber between them as is shown by letter *m*. The cocks are made to revolve equally by cog wheels gearing into each other; so if cock *k* is open towards the water reservoir, cock *l* will be closed towards the tube leading to the generator, the chamber between the cocks will therefore be filled with water through cock *k*. By that time cock *k* closes and *l* opens towards the generator; the water in the chamber will then descend through *o* into the generator, by its own gravity, and its place be occupied in the chamber by steam from the generator. Cock *k* opens again towards the chamber, and *l* is closed towards the generator; the steam in the chamber will be condensed by the water now entering, or escapes into the water reservoir *n*. This revolution goes on continually. If water be presented by cock *l* to the generator, and the said generator should be sufficiently full, the water being up to the dotted lines, in such a case the water will not be received, but remains in the chamber until part or the whole is wanted, the cocks constantly revolving. By this arrangement the water can be kept constantly at the desired height. Figs. 1', 2', 3', and 4', elucidate my improvements in the safety apparatus, as applicable to my tubular circulatory steam-generator, or to any other boiler where high or low pressure steam is generated. Fig. 1' shows a longitudinal section of the compound tube: *a* is the piston rod screwed into the piston *b*, which piston fits into the cylindrical tube *e*, screwed or otherwise fixed at its base into the pipe that connects it with the steam receiver or boiler. *o* is a hole perforated through *b* to allow the steam to ascend into the hollow space *n*, above the piston, so that the pressure is equal on both sides with the exception of the piston rod, the diameter of which alone is unbalanced. The piece *h*, screwed into the upper part of tube *e*, prevents the steam from ascending higher; another piece, *g g*, having a hollow space on the top, is screwed into *h*. Both these pieces have a hole bored in their centre, lengthways, of a diameter equal to the piston rod *a*, and to allow it to work up and down. The hollow space *i i*, in the middle of the two pieces *g* and *h*, is filled with packing so as to prevent any escape of steam along the piston. The hollow space *p*, at top, is filled with

oil: *k* is a basin, with water up to the dotted line to keep the upper part cool; the weights with which the safety apparatus are intended to be loaded are placed on the collar *m*. The hollow tube *e* has longitudinal openings, as will be perceived by fig. 3', which presents an outside front view of the apparatus, and through these openings the steam escapes whenever the piston *b* rises. These holes may be of an indefinite length and breadth; a jacket *f*, represented by fig. 2', which fits over the tube *e*, and has likewise the same number of longitudinal holes cut through it, slides over the said tube, and, by adjusting this jacket at *x*, the channel for the escape steam can be made narrower accordingly, as it may be desirable to have the piston rod raised more or less. The hollow vessel *l*, or a vessel of any other form, slides or is otherwise fixed over the lower part of the apparatus, so as to intercept the steam from incomming the upper part of it where the rod is loaded. The pipe *q* leads from this hollow vessel *l* to the steam condenser, or serves for the escape of steam. Fig. 4' presents an outside view of the piston: *a* is the rod already described: *c, c*, are packing rings, two on the upper side and two on the lower side. These rings press against the tube *e*, in order to keep it steam-tight, so that no steam can escape through the longitudinal openings: *d, d*, are two pieces of metal screwed on at the top and base of the piston to confine the packing rings. Sheet third, fig. 5', exhibits an elevation of my said compound steam-engine, with the aforesaid arrangement of cog-wheels, constituting my said fifth particular. *A* is the furnace containing the steam generator or boiler: *B* is the dome on the top of the steam receiver, with the steam-pipe *c*, and safety apparatus *m*. *D* is a cock upon pipe *c*, through which steam is admitted to the high-pressure engine *E*. After having acted upon it the said steam passes into the low-pressure engine *F*, constructed on my principle on a larger scale, so as to allow the steam to expand, and then act upon it as low-pressure: *E* and *F* have pinion wheels, of an equal pitch, gearing into a spur wheel *G*: these wheels determine the power given to each engine by regulating their motion with reference to the power required from each. The steam finds its escape at *z* into the condenser *u*: the condensed steam or water runs through pipe *r* by its own gravity towards the two revolving cocks, *k*, whence it is conveyed back to the feeding pipe in the steam generator. *v* is an engine constructed upon the plan elucidated by figs. 5 and 6 on sheet first, having two induction and two eduction pipes, which engine serves as a pump in this particular situation. Pipe *w* sucks the water from the well or river, and carries it into the refrigerator: *x* receives the water in the refrigerator and carries it downwards: *p* is the bellows, fanning the fire by means of a band round the axle *q*, connected with two pulleys, *r* and *s*, or by any other contrivance: *o* is the valve and lever of the bellows, connected by rod *n* with the safety apparatus: *t* and *u* are pulleys connected by a band to give rotary motion to pump *v*; but many other contrivances may be used: *z* is a cock which is only opened before the

engine is set to work, in order that the air may be driven out of the pipes and condenser by the steam; the cock may then be shut and the engine set to work: γ is a pipe leading from the safety apparatus to the condenser.'

208. The principle of the high-pressure steam engine, which must next be examined, depends on the power of steam to expand itself very considerably beyond its original bulk, by the addition of a given portion of caloric, thus acquiring a considerable elastic force, which, in this case, is employed to give motion to a piston. One of the greatest advantages attendant on employing the repellent force of steam, as in this form of the engine, consists in an evident saving of the water usually employed in condensation; and this, in locomotive engines, for propelling carriages, is an object of considerable importance.

209. Leupold has furnished a description of a high-pressure engine, in a very valuable work on machines, published in 1724. He ascribes the invention to Papin, and his apparatus consists of two single cylinders placed at some distance from each other, each of which is provided with a piston made to fit air-tight, and connected with a forcing pump.

210. When high-pressure steam is admitted at the bottom of the first cylinder, it is forced upwards, carrying with it the lever of the pump; at the same time that the steam or air is expelled from the other. On this operation being repeated, or rather reversed, the steam is allowed to enter the second cylinder, which is also connected with the boiler, while the steam in the first cylinder is allowed to escape into the air. From this it will be evident that the process of condensation forms no part of the principle of the high-pressure engine; and that the expansion of gunpowder might be made to produce a precisely similar effect.

211. The amazing force to be produced by the expansion of highly elastic vapor did not escape the penetrating notice of that towering genius, which was now directing all its energies towards its improvement. Accordingly, we find, in Mr. Watt's first patent, the following clause, which expressly describes this engine: 'I intend, in many cases, to employ the expansive force of steam to press on the pistons, or whatever may be used instead of them, in the same manner as the pressure of the atmosphere is now employed in common fire engines. In cases where cold water cannot be had in plenty, the engines may be wrought by the force of steam only, by discharging the steam into the open air after it has done its office.'

212. Messrs. Trevithick and Vivian were the first to employ the high-pressure engine to advantage, as they found it admirably adapted for the purpose of propelling carriages. In this case the steam, after having performed its office, was thrown off into the air; and the condenser, together with the necessary supply of cold water which must have accompanied it, was by this means dispensed with. For the purpose of motion, the high-pressure engine certainly possesses considerable advantages, not the least of which are its cheapness and portability; the

danger, however, attendant on the use of steam acting with a force equal to from forty to eighty pounds on the square inch, must inevitably form an insuperable bar to its general introduction to our manufactures.

213. Mr. Woolf's improvements, which we shall presently more fully examine, are of considerable importance, and are founded on the same principle as those of Mr. Watt, namely the power of steam to expand itself, or increase its volume in a very considerable degree, after its passage from the boiler. From a variety of experiments made on this subject, he ascertained that a quantity of steam having the force of five, six, seven, or more pounds on every square inch of the boiler, may be allowed to expand itself to an equal number of times of its own volume, when it would still be equal to the weight of the atmosphere, provided that the cylinder in which the expansion takes place have the same temperature as the steam possessed before it began to increase.

214. The most economical mode of employing this principle consists in the application of two steam cylinders and pistons of unequal size to a high-pressure boiler; the smaller of which should have a communication, both at its top and bottom, with the steam vessel. A communication being also formed between the top of the smaller cylinder and the bottom of the larger cylinder, and vice versa. When the engine is set to work, steam of a high temperature is admitted from the boiler to act by its elastic force on one side of the smaller piston, while the steam which had last moved it has a communication with the larger or condensing cylinder. If both pistons be placed at the top of their respective cylinders, and steam of a pressure equal to forty pounds on the square inch be admitted, the smaller piston will be pressed down; while the steam below it, instead of being allowed to escape into the atmosphere, or pass into the condensing vessel, as in the common engine, is made to enter the larger cylinder above its piston, which will make its downward stroke at the same time as that in the smaller cylinder; and, during this process, the steam which last filled the larger cylinder, will be passing into the condenser to form a vacuum during the downward stroke.

215. To perform the upward stroke it is merely necessary to reverse the action of the respective cylinders; and it will be effected by the pressure of the steam in the top of the small cylinder acting beneath the piston in the great cylinder; thus alternately admitting the steam to the different sides of the smaller piston, while the steam last admitted into the smaller cylinder passes regularly to the different sides of the larger piston, the communication between the condenser and steam boiler being reversed at each stroke.

216. The economical application of this engine may however be best understood by an examination of its effective force when applied to the raising of water. It appears that a double cylinder expansion engine was constructed for Wheel Vor mine in 1815. This has a great cylinder of fifty-three inches in diameter, and

nine feet stroke, the small cylinder being about one-fifth of the contents of the great one. The engine works six pumps, which at every stroke raise a load of water of 37,982 pounds weight, seven feet and a half high. This produces a pressure of 14.1 pounds per square inch on the surface of the great piston, while its average performance may be estimated at 46,000,000 pounds, raised one foot high with each bushel of fuel.

217. The steam or vapor, which is produced by the expansion or ignition of any inflammable body, has frequently been suggested for producing a vacuum, and even furnishing motive force to impel mechanism. Several contrivances of this kind might be noticed, but in the present case our limits will only permit of one exemplification. It is shown in the accompanying figures.

218. The above apparatus was suggested by an ingenious American, and the first part of the machine consists of a metallic or other vessel, or tubes, so constructed that a stream or current of atmospheric air may pass, together with the inflammable vapor, through a considerable space, interrupted by short turns or other impediments, the object of which is to mix and blend the air and the vapor thoroughly with each other, by which union they are rendered highly explosive.

219. Fig. 1, plate VI., consists of an oblong box of tin or other metallic plates, divided horizontally into four compartments, by the partitions *a, a, a*, which extend alternately from one end of the box to within a short distance of the other end, so that air, entering the lower compartment at *b*, would be compelled by the partitions to travel the whole length of the box through each compartment, in its ascent to the top. These compartments are divided by the vertical partitions *c, c*, running the whole length of the box, into half inch spaces, which produces the two-fold advantage of increasing the friction of the particles of vapor and air with each other, and also of preventing violence in the event of any explosion, should such an accident take place within the box. There is a tube *d*, for the admission of air and the other materials into the lower compartment at *b*, and another tube *e*, for the outlet of the explosive mixture from the upper compartment, each covered with a wire-gauze to prevent explosion, which completes the preparing vessel.

220. Fig. 2 is a front view of the apparatus; fig. 3, a section taken transversely; A is a cylinder of brass, copper, or other material, fitted with a plunger or piston B, connected with a crank shaft C, as in a steam-engine. The lower end of the cylinder has a valve D, of at least half its diameter, opening outwards. This valve D may be made very simply by a rim of leather, or other flexible substance, of the same diameter as the opening into the cylinder. This rim of leather is to be tied round the lower end of the cylinder, so as to form a continuation of it. The bottom part of the leather is to be flattened so as to bring its sides together, for four or five inches of its length, and to be kept in that position by slight springs, attached to the edges of the flat part, something like a bow and

bow-string. This valve is supported or prevented from being pushed into the cylinder by a plate of metal, of sufficient thickness to bear the pressure of the atmosphere, arched or curved outward, and perforated with as many holes, of one-eighth or one-quarter of an inch diameter, as can conveniently be made in it. The end of the cylinder forms the abutment to the arched plate.

221. A valve E, opening outwards, is fixed in the side of the cylinder at the bottom, for the purpose of admitting air to the interior. The inflammable vapor is passed from the preparing box F (shown detached at fig. 1), through a pipe *e, e*, which extends entirely round the cylinder, at the depth of about one-sixth of the stroke of the piston from the top. The cylinder is perforated with small holes, in that part embraced by the pipe *e*, for the passage of the inflammable vapor to the interior. The neck of this pipe *e* should be as short as possible, to prevent the vapor condensing before it reaches the cylinder, and should be furnished with a valve *f*, next the preparing vessel, to cut off the communication between it and the cylinder, while the explosion takes place. A small valve *g*, next the cylinder, opening outwards, permits the inflammable vapor to be ignited by the flame of a lamp *h*; these valves being worked by cams *i, k*, on the revolving crank-shaft, or by any other convenient method.

222. A perforated plate of thin metal *l* is introduced into the cylinder below the piston B, supported and guided by small rods *m, m*, working sufficiently tight in a stuffing-box in the piston B. This plate *l* ascends and descends with the piston, and is prevented from rising higher than the vapor pipe *e*, by the upper ends of its rods *m, m*, striking a stationary part above. In this situation it forms a partition between the explosive mixture and the air in the lower part of the cylinder. A wire gauze should also be placed between the vapor valve *f*; and inflaming valve *g*, to prevent explosion, should the former not close in time. It will be seen at fig. 2 that there are two cylinders fitted up in this way, and communicating with the same preparing vessel and crank-shaft.

223. To prepare the explosive mixture, there must be a small quantity of alcohol, either alone or mixed with spirit of turpentine, or any other inflammable material, capable of evaporation, introduced into the lower compartment of the vessel F. A lamp *n*, or other heat if necessary, is now to be placed under the preparing vessel, for the purpose of raising the temperature, and keeping the materials about blood heat. The flame of a lamp *h* is also to be stationed at the inflaming valve *g*. If too much vapor is raised in proportion to the quantity of air, the mixture ceases to be explosive.

224. The piston B, in its ascent, would cause a partial vacuum in the cylinder, but this is prevented by raising the valve E, which supplies the cylinder with air till B reaches the pipe *e* here the perforated plate *l*, stops, while the piston B continues its motion to the top of the cylinder; the air-valve E is now closed, and the remainder of the cylinder above *l* is supplied

Fig. 3.

Fig. 1.

Fig. 2.

with explosive mixture through the pipe *e*, from the preparing box. Just before the piston *B* reaches the end of its stroke, the inflaming valve *g* opens, and the flame of the lamp communicating to the vapor causes an explosion which instantly drives out the contents of the cylinder through the perforated arched plate *l*, and flexible leathern valve *D*, which leather valve immediately collapses again to prevent the return of the air.

225. The steam formed by the explosion is condensed by keeping the cylinder below the pipe *E* cool, by surrounding it with water in the jacket *O O*, and by injecting a jet of water through the cock *p*, (which is also worked by a cam *q*, on the crank-shaft).

226. The vacuum being formed under the piston *B*, it descends by the pressure of the atmosphere, and its connecting rods communicate motion to the crank-shaft, in the same way as in ordinary steam engines; and, a similar operation being carried on in the second cylinder, the power is taken from the crank-shaft, and employed as a moving power.

227. The patent apparatus for generating steam, suggested by Mr. Gurney, promises to be of considerable importance as an adjunct to the high-pressure engine. The specification of his patent contains a description of two sorts of boilers. The first is a tubular vessel consisting of a series of portions, each formed like the figure 8, and these being arranged together, one behind the other successively, will form two cylindrical compartments, in the lower one of which the fire is made, on bars placed across the lower portion of the curved tubes, while the upper one serves as a funnel to convey the smoke to the chimney. Besides the curved tubes, which thus constitute the boiler, two straight tubes, of considerably larger size, are used to connect the others together and form the communication between them, one of which runs across beneath them at bottom and conveys the water to them, and the other passes across them at top, and carries off the steam from them to the working cylinder, apertures being made through them and the bent tubes at their points of contact to form passages for the water and the steam. To make the fire act more powerfully on the upper part of the lower cylindrical compartment, and also to prevent it from passing up between the tubes into the upper compartment, a plate of iron is laid along over the whole of the bottom of this latter, which compels the flame and heated vapor to pass on to its end before it can enter the upper compartment, along which latter they afterwards pass on their way to the chimney, heating in their passage the upper portions of the bent tubes. To confine the heat a double case of iron encloses the whole apparatus, between the two constituent parts of which a space is left, which being filled up with pumice-stone, or some other bad conductor of heat, makes the heat act more powerfully in the direction required. This sort of boiler may be varied by having a greater number of cylindrical compartments formed by additional flexures of the bent tubes on the principle above-mentioned.

228. The second species of boiler is composed

of two horizontal cylinders, one of which being somewhat smaller than the other is placed within it, and united to it at the edges, leaving sufficient space between the two for the reception of water. Above this double cylinder two double semi-cylinders, formed in a similar manner, are placed one over the other with the hollow part downwards, and the communication between them is effected by bent tubes, which pass from the upper part of the double cylinder to the lower parts of the double semi-cylinder next it at each side, and also from the upper part of this latter to the lower edges at each side of the upper double semi-cylinder. The fire is made within the double cylinder on bars placed on bearers about a third of the height from the bottom, and the flame and smoke pass from its farther end into the space between it and the first semi-cylinder, beneath which they return towards the front and pass round beneath the upper double semi-cylinder, whence they enter the chimney at its further end. The double cylinder, and the double semi-cylinders, are divided into a number of small vertical parallel compartments by bent bars of iron placed within them at regular distances, and fastened by rivets which pass through them and the parts of the cylinders and semi-cylinders with which the bars are in contact. These bent bars are somewhat shorter than the parts within which they lie, so as to leave a free space beneath them for the passage of water, or of water and steam, according to their positions; and a similar space may be left by the same means along the upper ridges of the cylinder and semi-cylinders for the passage of the steam, which may be also conveyed by separate tubes from each of the small compartments. A large straight tube runs beneath the bottom of the cylinder to convey water to it, and another proceeds along the top of the upper semi-cylinder to carry off the steam from it to the working cylinder. The whole of this boiler is to be also enclosed in a case similar to that of the first described boiler.

229. An account is next given of an apparatus for separating the steam from the water when they are forced out intermixed from tubular boilers, which consists of an upright cylinder, into the upper part of which a tube enters from the top of the boiler, and then bends round and descends to near its bottom, whence another tube returns again to the boiler at its lowest projection. Near the bottom of the cylinder a wooden valve is placed, which permits the water separated from the steam to return into the boiler; but, in case of any sudden expansion of the steam in the boiler, it rises up and prevents water from the boiler being forced by this expansion into the cylinder. From the top of this cylinder the steam proceeds to the engine through another tube, after having left behind the water with which it was first intermixed.

230. Another apparatus is after this described, whose office is to convey water to the boiler. This is also an upright cylindrical vessel, from the top of which a pipe goes to the reservoir, and from its bottom another pipe descends to near the bottom of the vessel last described, while a third tube passes down from its upper

part to about the middle of the former vessel. In the pipe that goes to the reservoir is a stop-cock near the top of the vessel, and two more in the two descending pipes, which latter may be placed so as to be closed by one plug traversing the two; to these cocks are fixed cranks connected together by a bar worked by the steam engine, and the passages of the cocks are so arranged that when the two lower ones in the descending pipes are closed, that in the upper one leading to the reservoir will be open, and vice versa. By this arrangement of the pipes the end of the one that passes from the top of the upper vessel to the middle of the lower one will be sometimes above the water and sometimes beneath it, according as its level varies in this vessel; when the first happens the patentee states that the steam will rise up through it into the upper vessel, and will force the water which this contains through the other descending pipe into the lower vessel; and when the latter case occurs, and its lower end is immersed, then the passage of the water will be interrupted. It is mentioned that this latter apparatus may be used with any other sort of steam-boiler as well as those described.

231. Finally, a method is recited for freeing the tubes of the boilers from the sediment and incrustations that are more or less formed in all boilers, which method consists in filling them, if formed of iron, with a mixture of one part of muriatic acid to 100 parts of water, or with a mixture of vinegar and water, in the proportion of a pint of the former to three gallons of the latter; and if the tubes are made of copper, then sulphuric acid is directed to be added to marine salt, in the proportion of half an ounce to a pound, and with a proper quantity of water to be put into them. These mixtures are to be used cold, and a little while after one of them is poured in, a small fire of chips is to be made under the boiler, to make the fluid circulate and bring fresh portions of it in contact with the concretions; and, when these are observed to be sufficiently dissolved, the liquor is to be run off through a cock in the bottom of the boiler along with the undissolved siliceous matter.

232. Mr. M'Curdy's apparatus has excited too much attention to be passed without particular notice. It consists of eleven cylinders, twelve feet long and twelve inches in diameter, placed horizontally in two rows, like gas retorts, in a furnace, six being in the lowest row and five in the upper one over the intervals of these, and a fire-place being made under each three of the cylinders in the lower row. Each cylinder contains another cylinder within it, so much smaller as to leave a space between them of about an inch in extent, which space is to be maintained by bands, or pins, reaching so much beyond the inner cylinders, and placed on them at regular distances asunder.

233. Above the eleven double cylinders, or steam-generators, in the same furnace, a twelfth cylinder of the same length, but somewhat more than thirty inches in diameter, is placed, which Mr. M'Curdy calls a *steamometer*, and which will hold ten times the contents of all the spaces between the inner and outer cylinders; the eleven

outer cylinders are connected by tubes, which run from one to the other sideways near their tops in each row, and from the lower to the upper row; a tube also passes from the upper row of cylinders to the steamometer, and another goes from the latter to the working cylinder of a steam engine. The supply of water is given by a forcing pump, which draws it from the reservoir and impels it into the space between the inner and outer cylinders, which are placed at the outside of the lowest row, and thence through the tubes and the spaces between all the other inner and outer cylinders up to the steamometer; at the bottom of which latter a cock is placed, by which the ascent of the water to that point may be known; while by another cock, fixed between the forcing pump and the reservoir, the degree of the supply of water is regulated. A safety valve on the steam tube, close to where it passes from the steamometer on its way to the steam engine, completes the apparatus.

234. In pursuing the history of the steam engine, we have already examined the most perfect form of the single-acting apparatus; but an engine of double powers was soon produced by the comprehensive mind of Mr. Watt. He had introduced steam acting against a piston to press it downwards; he now formed a communication between both sides of the piston and the boiler, and also with the condenser, and made the steam act to press the piston upwards as well as downwards.

235. The mechanism was now, as far as the principle went, perfect; and it was freed, for the first time, from the enormous dead weight of counterpoises, which had hung on it from the first attempts of Newcomen; and the equally enormous load which was used in the construction of the various parts, for the purpose of equalising the motion.

236. The cylinder *a*, plate VII., is enclosed in a jacket or casing like the single engine, having a similar interval, which may be filled with steam or air. The piston *b* is attached to the lever-beam by the rod *x*. 1, 2, 3, 4, are the valves which admit steam to the cylinder, or open a communication between the upper and under sides of the piston and the condenser. *g* is the pipe leading from the valves to the condenser. *m, m*, the levers or spanners, which are elevated or depressed by the tappets or pins *n, z*, in the plug-frame, and open or shut the valves to which they may be connected. *h* is the condenser; *l*, a pipe connecting it with air-pump *i*, and a second air-pump *e*. *c*, the piston-rod of this second pump, attached like the other, *l*, to the lever-beam. *r*, a pipe from the cold water-pump *q*, to supply the reservoir in which the condenser and its pumps are placed. *k*, a trough or reservoir into which the water heated by the condensation of steam in the condenser, which is raised by the air-pump is pumped back by *m* into the boiler. *c*, a pulley; and *n*, an endless chain moving over it, also going round a pulley fixed on the upright axis of the conical pendulum or governor *z*. *r*, the handle of the lever which regulates the quantity of injection water admitted. *p, p*, the masonry or wall on which the cylinder, and other parts of

the machine are placed. *d*, a pipe conveying steam from the boiler to the cylinder. *b*, a cock or valve, called the throttle-valve or regulator, placed on the pipe conveying the steam from the boiler, and which is moved by the levers shown as supported at *D*, and connected with the conical pendulum. *t*, *q*, *o*, *q*, *w*, are a system of levers, called the parallel motion. *z* is the axis of the lever-beam *y*.

237. The motion at first is produced in this machine in the same manner as in the single engine,—by filling the condenser and cylinder with steam, and then opening the injection-cock.

238. This process may be considered to have been gone through, and that the piston has arrived at the top of the cylinder. At this moment the tappets *n*, *n*, and levers *m*, *m*, open the valves 1 and 4, and shut 3 and 2. The steam from the boiler now acts on the upper side of the piston, while a vacuum is formed under it by valve 4 opening a communication between that part of the cylinder beneath it and the condenser. The piston is therefore pressed by the elasticity of the steam to the bottom; when it has arrived at the lowest point, the tappets on the plug frame, which also descend with the piston-rod, shut the valves 1 and 4, and open 3 and 2. The steam from the boiler, instead of flowing in at the top of the cylinder, is admitted at the bottom, and a communication is opened between the upper end of the cylinder and the condenser: a vacuum is then produced above the piston, and the elasticity of the steam (instead of the counterpoise in our last figure) forces it upwards. When it is elevated to the required height, the tappets again act on the spanners, and prevent the further flow of steam beneath the piston, and admits it at its upper end, opening at the same moment a communication between the lower end and condensing apparatus. The motion of the piston is then reversed, and this alternation may be continued indefinitely.

239. The mode of pumping out the water from the condenser, being the same as that in the single engine, will be easily understood from an inspection of our figure. In order to show the four valves in section, a pipe placed in the same direction, and opposite to *o*, has been omitted in the engraving; it connects the top of the cylinder and the condenser together.

240. The power of the condensing engine is easily known by ascertaining the temperature of the steam, which moves the piston, the area of the piston, and the temperature of the vapor which remains in the condenser. We know from experiment that steam of the temperature of 212° will balance the pressure of the atmosphere, or, what is the same thing, will force a piston into a vacuum with a force equal to about fourteen pounds and three quarters weight for every square inch of the area of the piston. The difference between the elasticity of the steam in the condenser, and that issuing from the boiler, will be the measure of the power of the engine. It is however found most expedient to raise the steam to a somewhat higher temperature than 212° , so as to produce a pressure between seventeen and eighteen pounds on each square inch of the piston; yet, in practice, from

the imperfect vacuum which is made in the condenser, and after making allowance for the friction of the piston on the sides of the cylinder, and for the friction of the various parts of the intermediate machinery, this pressure of eighteen pounds on each square inch of the piston, cannot raise more water per inch than would weigh about eight pounds and a half, so that somewhat more than a half of the whole power of the steam is absorbed to give motion to the intermediate mechanism. The height to which this weight can be elevated depends on the length of the cylinder, and to raise the same weight to twice the height by the same piston requires double the quantity of steam. The double condensing engine will also perform double the work of a single engine in about half the time, but it requires double the quantity of steam. So that in all cases, under the same circumstances, the work performed will be as the quantity of steam used.

241. When the impulse of the steam impelled the piston only in one direction (downwards) its motion could be imparted to the beam by means of chains; but, when the impulse was to be communicated upwards as well as downwards, some other contrivance for connecting the beam and piston became necessary; and one of the conditions of this contrivance must be, to convert the motion in a curved path of the end of the lever-beam, into a rectilinear motion of the cylinder piston-rod. Mr. Watt, in his earlier engines, used to form the end of the beam as a sector with teeth, which worked into a rack fixed on the end of the piston-rod; this allowed the rod to move perpendicularly upwards or downwards, but it was very inelegant in appearance, worked with a great noise, and was easily deranged, especially at the instant when the direction of the motion was changed.

242. Even after the motion of the piston was equalised, by shutting off the steam sooner or later from the cylinder, another source of irregularity was found to arise from the varying quantity of steam which in different states of the fire under the boiler, was admitted into the cylinder. Several modes of adjustment occurred to Mr. Watt. The one most generally employed, and probably as accurate as any, was, by placing a valve in the pipe connecting the boiler and the cylinder, which could be made to increase or diminish the steam-way. The next improvement was to make this valve, called a throttle-valve, a self-acting one, and to admit of its being so adjusted that, when the piston was moving with too great a velocity, it would admit less steam into the cylinder, and so diminish its speed, and on the contrary admit a greater quantity when it was moving too slow.

243. A similar irregularity in the motion of corn-mills, from the varying quantity of water or resistance, had early exercised the ingenuity of millers, to obtain some means by which its injurious effects could be obviated. One of the most usual modes was by means of a couple of heavy balls, attached by a jointed rod, which were made to revolve by being connected with the spindle or axis of the mill-stones. When the stones were moving at a great speed, the meal, by the rise of the stones, was too coarse;

and, on the contrary, when the motion was too slow, the meal produced was small in quantity, and too fine. The attached balls, which were called a lift-tenter, by their centrifugal force either raised or lowered a stage in which the arbor of the spindle revolved, and brought the mill-stones nearer, or removed them farther from each other, as they might be adjusted. This most ingenious regulator was adopted by Mr. Watt, and was applied to regulate the opening and shutting of the throttle-valve of his improved engine.

244. Mr. Hornblower's engine combined the high pressure principle, and the condensing apparatus, in one engine. We are not to consider this engine as being on a different principle from Mr. Watt's, but as applying his principles of condensation and expansion in a different manner from what Mr. Watt does. Mr. Hornblower obtained a patent in 1781 for a machine or engine for raising water by means of fire, and the specification of the patent was as follows:—First: 'I use two vessels, in which the steam is to act, and which in other engines are called cylinders. Secondly: I employ the steam after it has acted in the first vessel to operate a second time in the other, by permitting it to expand itself, which I do by connecting the vessels together, and forming proper channels and apertures, whereby the steam shall occasionally go in and out of the said vessels. Thirdly: I condense the steam, by causing it to pass in contact with metalline surfaces, while water is applied to the opposite side. Fourthly: To discharge the engine of the water used to condense the steam, I suspend a column of water in a tube or vessel constructed for that purpose, on the principles of the barometer, the upper end having open communication with the steam vessels, and the lower end being immersed in a vessel of water. Fifthly: To discharge the air which enters the steam-vessels with the condensing water, or otherwise, I introduce it into a separate vessel, whence it is protruded by the admission of steam. Sixthly: That the condensed vapor shall not remain in the steam-vessel in which the steam is condensed, I collect it into another vessel, which has open communication with the steam-vessels, and the water in the mine, reservoir, or river. Lastly, in cases where the atmosphere is to be employed to act on the piston, I use a piston so constructed as to admit steam round its periphery, and in contact with the sides of the steam-vessel, thereby to prevent the external air from passing in between the piston and the sides of the steam-vessel.'

245. The following is a description of this engine by the inventor, as it was published in the Encyclopædia Britannica. Let A and B (plate III. fig. 1) represent two cylinders, of which A is the largest; a piston moves in each, having their rods, C and D, moving through collars at E and F. These cylinders may be supplied with steam from the boiler by means of the square pipe G, which has a flanch to connect it with the rest of the steam-pipe. This square part is represented as branching off to both cylinders: *c* and *d* are two cocks, which have handles and tumblers as usual, worked by the plug-beam W. On the fore-side of the cylinders, that is, the side next the eye, is represented another communicating pipe, whose section is also square, or rectangular,

having also two cocks *a, b*. The pipe Y, immediately under the cock *b*, establishes a communication between the upper and lower parts of the small cylinder B, by opening the cock *b*. There is a similar pipe on the other side of the cylinder A, immediately under the cock *d*.

246. When the cocks *c* and *a* are open, and the cocks *b* and *d* are shut, the steam from the boiler has free admission into the upper part of the small cylinder B, and the steam from the lower part of B has free admission into the upper part of the great cylinder A; but the upper part of each cylinder has no communication with its lower part.

247. From the bottom of the great cylinder proceeds the eduction-pipe K, having a valve at its opening into the cylinder; it then bends downward, and is connected with the conical condenser L. The condenser is fixed on a hollow box M, on which stand the pumps N and O, for extracting the air and water, which last runs along the trough T, into a cistern U, from which it is raised by the pump V, for recruiting the boiler, being already nearly boiling hot. Immediately under the condenser there is a spigot-valve, at S, over which is a small jet-pipe, reaching to the bend of the eduction-pipe K. The whole of the condensing apparatus is contained in a cistern, R, of cold water; a small pipe, P, comes from the side of the condenser, and terminates on the bottom of the trough T, and is there covered with a valve, Q, which is kept tight by the water that is always running over it.

248. Lastly, the pump-rods, X, cause the outer end of the beam to preponderate, so that the quiescent position of the beam is that represented in the figure, the pistons being at the top of the cylinders.

249. Suppose all the cocks open, and steam coming in copiously from the boiler, and no condensation going on in L, the steam must drive out all the air, and at last follow it through the valve Q. Now shut the cocks *b* and *d*, and open the valve S of the condenser; the condensation will immediately commence, and draw off the steam from the lower part of the great cylinder. There is now no pressure on the under side of the piston of the great cylinder A, and it immediately descends. The communication Y, between the lower part of the small cylinder B and the upper part of the great cylinder A, being open, the steam will go from the lower part of B, into the space left by the descent of the piston of A. It must therefore expand, and its elasticity must diminish, and will no longer balance the pressure of the steam coming from the boiler, and pressing above the piston of B.

250. This piston, therefore, if not withheld by the beam, would descend till it came in equilibrio, from having steam of equal density above and below it. But it cannot descend so far for the cylinder A is larger than B, and the arch of the beam, at which the great piston is suspended, is no longer than the arm which supports the piston of B; therefore, when the piston of B has descended as far as the beam will permit it, the steam between the two pistons occupies a larger space than it did when both pistons were at the top of their cylinders, and its density diminishes as its bulk increases. The steam beneath

HORN BLOWER'S

Fig. 1.

the small piston is, therefore, not a balance for the steam on the upper side of the same, and the piston B will act to depress the beam with all the difference of these pressures.

251. The slightest view of the subject must show the reader that, as the pistons descend, the steam that is between them will grow continually rarer and less elastic, and that both pistons will draw the beam downwards. Suppose, now, that each one had reached the bottom of its cylinder, shut the cock *a*, and the eduction-valve at the bottom of A, and open the cocks *b* and *d*. The communication being now established between the upper and lower part of each cylinder, their pistons will be pressed equally on the upper and lower surfaces; in this situation nothing, therefore, hinders the counter-weight from raising the pistons to the top.

252. Suppose them arrived at the top: the cylinder B is at this time filled with steam of the ordinary density; and the cylinder A with an equal absolute quantity of steam, but expanded into a larger space. Shut the cocks *b* and *d*, and open the cock *a*, and the eduction-valve at the bottom of A; the condensation will again operate, and cause the pistons to descend; and thus the operation may be repeated as long as steam is supplied; and once full of the cylinder B, of ordinary steam, is expended during each working stroke.

253. The cocks of this engine are composed of two flat circular plates, ground very true to each other, and one of them turns round on a pin through their centres: each is pierced with three sectorial apertures, exactly corresponding with each other, and occupying a little less than one-half of their surfaces. By turning the moveable plate so that the apertures coincide, a large passage is opened for the steam; and, by turning it so that the solid part of the one covers the aperture of the other, the cock is shut. Such regulators are now very common in the cast-iron stoves for warming rooms. Mr. Hornblower's contrivance for making the collars for the piston-rods air-tight is thus: the collar is in fact two, placed at a small distance from each other; and a small pipe, branching off from the steam-pipe, communicates with the space between the collars. This steam, being a little stronger than the pressure of the atmosphere, effectually prevents the air from penetrating through the upper collar; and, though a little steam should get through the lower collar into the cylinder A, it can do no harm. The manner of making this stuffing-box is as follows: on the top of the cylinder is a box to contain something soft, yet pretty close, to embrace the piston-rod in its motion up and down; and this is usually a sort of plaited rope of white yarn, nicely laid in, and rammed down gently, occupying about a third of its depth; upon that is placed a sort of tripod, having a flat ring of brass for its upper, and another for its lower part; and these rings are in breadth equal to the space between the piston-rod and the side of the box. This compound ring being put on over the end of the piston-rod, another quantity of this rope is to be put upon it, and gently rammed as before; then there is a hollow space left between these two packings, and that space

is to be supplied with strong steam from the boiler. Thus is the packing about the piston-rod kept in such a state as to prevent the air from entering the cylinder when at any time there may be a partial vacuum above the piston.

254. Mr. Hornblower's description of this engine was followed by a mathematical investigation of the principles of its action, by the ingenious professor Robison, which demonstrates that it is the same thing in effect as Mr. Watt's expansion-engine; but, though this is true, there is a considerable difference in the steps by which the effect is attained, which gives an important advantage when it is reduced to practice. We shall give an investigation in a more popular form, using only common arithmetic. Mr. Hornblower assumed that the power or pressure of steam is inversely as the space into which the steam is expanded: this is the case with air, and, for the present, we will grant it to be so with steam, and reason from the same data as the ingenious inventor gives us.

255. To explain clearly what passes in the two cylinders, we must deviate from the precise form of the engine, and divest ourselves of one complication of ideas, by reducing both cylinders to the same stroke; therefore, suppose the engine to be made like fig. 2, which represents the two cylinders placed one upon the other, the lower one being double the capacity of the upper one, and both pistons being attached to the same rod, which may be applied to the end of the beam, so that the descent of the pistons must draw up the load at the opposite end of the beam.

256. Then, if we suppose the small piston to be ten inches in diameter, the great piston must be 14.14 inches; and to avoid all difficulties of the ratio of the expansion, and the pressure of steam, we will suppose the engine to be worked by the pressure of atmospheric air instead of steam; and, for the convenience of round numbers in our calculation, we will consider the pressure at only ten pounds per circular inch on the surface of the piston.

257. The area of the small piston will be 100 circular inches, and, being assumed to move without friction, the pressure upon it will be $10 \times 100 = 1000$ lbs. The area of the great piston is twice as much, or 200 circular inches, and the pressure 2000 lbs.

258. Suppose both pistons to be at the top of their respective cylinders; let the atmospheric air be admitted to press freely upon the upper surface of the small piston; and suppose the space between the two pistons filled with air of the same density, while there is a perfect vacuum made in the lower part of the great cylinder, beneath its piston.

259. Under these circumstances, the two pistons will begin to descend with something less than 2000 lbs. of load upon the outer end of the beam, because there are 2000 lbs. of pressure on the great piston by the air contained in the space between the two pistons, bearing on the 200 inches of surface with a weight of ten pounds per inch; and beneath this piston there is nothing to counteract the pressure. At the same time the small piston, having air of equal density above and below it, is in equilibrio.

Descending Power of the Great Piston.	Descending Power of the Small Piston.	Combined Power of both Pistons.
<p>At first the power will be $\frac{\text{lbs.}}{2000}$ In consequence of the pressure of 10 lbs. per circular inch upon its upper surface, and no pressure beneath.</p>	<p>At first the power will be $\frac{\text{lbs.}}{0}$ Because the piston is in equilibrio, having 1000 lbs. pressing upwards, and 1000 lbs. downwards.</p>	<p>At first $\frac{\text{lbs.}}{2000}$</p>
<p>At one-fourth of the descent the power will have diminished, by regular decrements, to $\frac{\text{lbs.}}{1600}$ Because the air between the two pistons must occupy three-fourths of the small cylinder, and one-fourth of the great cylinder, which is a space equal to one and one-fourth of the original space which it filled; therefore the spaces will be as five to four; and, if the density of air is as the inverse proportion of the space which it occupies, the pressure on the great piston must be as four to five, or four-fifths of $2000 = 1600$.</p>	<p>{ At one-fourth the power will be } $\frac{\text{lbs.}}{200}$ Because the equilibrium does not continue, and at one-fourth of the descent the pressure beneath the small piston is reduced by the expansion of the air between the two pistons to four-fifths of $1000 = 800$ lbs., while the pressure above the piston continues to be 1000. The power is, therefore, $1000 - 800 = 200$.</p>	<p>At one-fourth $\frac{\text{lbs.}}{1800}$</p>
<p>At one-half of the descent the power will have diminished to $\frac{\text{lbs.}}{1333\frac{1}{3}}$ Because at this position the air between the pistons occupies one-half of the small cylinder and one-half of the great one, which is a space equal to one and one-half of the space it filled originally. The spaces will therefore be as six to four, and the pressure on the great piston as four to six, or two-thirds of $2000 = 1333\frac{1}{3}$.</p>	<p>{ At one-half of the descent the power will have increased to } $\frac{\text{lbs.}}{333\frac{1}{3}}$ Because the pressure beneath is diminished by the increased rarity of the air to two-thirds of $1000 = 666\frac{2}{3}$, while the downward pressure continues to be 1000. The power is therefore $1000 - 666\frac{2}{3} = 333\frac{1}{3}$.</p>	<p>At one-half $\frac{\text{lbs.}}{1666\frac{2}{3}}$</p>
<p>At three-fourths of the descent the power will be only $\frac{\text{lbs.}}{1142\frac{2}{7}}$ Because the air must now occupy one-fourth of the small cylinder, and three-fourths of the large cylinder, which is a space equal to one and three-fourths of the original space. Thus the spaces will be as seven to four, and the pressure on the great piston four-sevenths of $2000 = 1142\frac{2}{7}$.</p>	<p>{ At three-fourths of the descent the power will be } $\frac{\text{lbs.}}{428\frac{4}{7}}$ Because the pressure beneath is reduced by the rarity of the air to four-sevenths of $1000 = 571\frac{1}{7}$; therefore the power is $1000 - 571\frac{1}{7} = 428\frac{4}{7}$.</p>	<p>At three-fourths $\frac{\text{lbs.}}{1571\frac{1}{2}}$</p>
<p>At the bottom of the cylinder the power will be $\frac{\text{lbs.}}{1000}$ Because the air must occupy the whole of the large cylinder, a space equal to twice the small cylinder which it at first filled. The pressure will therefore be one-half of 2000.</p>	<p>{ At the bottom the power will be } $\frac{\text{lbs.}}{500}$ Because the air beneath the piston is reduced to one-half of its pressure, or 500, which, deducted from 1000, leaves 500.</p>	<p>At the bottom $\frac{\text{lbs.}}{1500}$</p>
<p>Sum of the powers exerted by the great piston in its descent $\frac{\text{lbs.}}{7076}$</p>	<p>Sum of the powers of the small piston $\frac{\text{lbs.}}{1461}$</p>	<p>Sum of the combined powers $\frac{\text{lbs.}}{8538}$</p>

261. Now let us consider how Mr. Watt's principle of expansion would operate in the same circumstances; that is, in a cylinder of 14.14 inches diameter; which is to be supplied with air of ten pounds pressure per circular inch, until it has completed one-half of its descent, and leaving the remainder of the descent to be accomplished by the expansion of the air already contained in the upper half of the cylinder.

	lbs.
At the beginning the power of descent will be	2000
At one-fourth the power will still be	2000
At one-half the power will be	2000
At three-fourths of the descent the power will be diminished to	1333½

Because the air must occupy one-fourth of the length of the cylinder, in addition to that half of the cylinder which it occupied before the expansion began; therefore the space is one and a half times the former, or as three to two, and the pressure will be two-thirds of 2000.

At the bottom the pressure will be	1000
Because the air is expanded to occupy twice the space it filled before.	

8333½

262. The sum total is very nearly the same as the former, but both are greater than they should be, from the imperfect manner in which we have been obliged to make our calculation, so as to express it in common arithmetic, without having recourse to fluxions, which is the only method of treating quantities that are constantly increasing or decreasing by any given law.

263. The source of the inaccuracy is easily explained: at first we set out with the pressure at 2000 lbs. in Mr. Hornblower's engine, and did not take into the account that it decreases at all, until the piston has descended to one-fourth, but reasoned as though it diminished all at once at that place; whereas it began to diminish from the very first starting. Here then we have taken a small quantity too much. In the same manner, our process takes no notice of the diminution which happens between one-fourth and one-half of the descent, or between the other points at which we have chosen to examine it; the result is, as if the diminution took place suddenly at each of those points. The remedy for this would have been to have taken the account at a greater number of places, as it is by fluxions alone that we can take an infinite number, so as to obtain a true result. Now in the second calculation of Mr. Watt's expansion-engine we have taken a still less number of steps for the consideration of the expansion, because, although there are four steps in the process, two of them are before the expansion begins.

264. This is the reason of the apparent difference; for in reality there is none in the sum total of the varying powers exerted through the whole stroke, as will appear to any person who will take the trouble to read professor Robison's investigation. But, if we consider the difference of the manner in which the whole power is expended during the stroke, we shall see great

reason to prefer Mr. Hornblower's method, from the much greater uniformity of the action; it begins at 2000, and ends at 1500; whilst Mr. Watt's begins at 2000, and ends at 1000; hence the necessity of those ingenious contrivances for equalising the action in Mr. Watt's patent of 1782. Mr. Hornblower's is not uniform, but approaches uniformity more nearly, so that he could have carried the effect of the expansive principle much farther, in employing stronger steam, than we believe he ever proposed to do.

265. We have been thus full upon this subject, because the gaining more power by the expansion of air or steam acting in double cylinders, has been a favorite idea with many, and there are no less than five different patents for it, but several of these have been upon mistaken notions; neither Mr. Watt's nor Mr. Hornblower's can have any advantage from shutting off the air, or from a double cylinder, when air is used to press the piston; nor could they derive any advantage from the expansion of steam in their engines, if the pressure of it was inversely as the space it occupies.

266. The advantage of the expansive principle arises wholly from a peculiar property of steam, by which, when suffered to expand itself to fill a greater space, it decreases in pressure or elastic force by a certain law, which is not fully laid down; that is, the relation between its expansive force and the space which it occupies is not clearly decided: but Mr. Woolf has found that, by applying these properties in their fullest extent to the double cylinder engine, he can make most important improvements in the effects which can be obtained from any given quantity of fuel. Steam is a fluid so different from air as to have no one property in common with it, except elasticity. This elasticity is wholly derived from the quantity of heat which it contains, and its force increases and diminishes with the quantity of heat; but by what law it increases or diminishes we are uncertain, because we have no measure of the actual quantity of heat which is contained in steam of any given elastic force. All we know with certainty is what is stated in our table of expansion, viz. that water, being converted into steam, and confined in a close vessel, when heated until the thermometer indicates a certain temperature, will have a certain pressure or elastic force. But here we must observe that the thermometer indicates only the intensity of the heat, without affording a direct measure of its quantity. When steam is suffered to expand itself into any given space, the quantity of rarefied water which will be found to be contained in any given bulk or steam, in its expanded state, must be undoubtedly proportioned to the quantity of water contained in the same bulk of the steam, before the expansion took place, in the inverse ratio of the space which it originally occupied, and that space which it fills when expanded; but we cannot say that this is the case with heat; and it is the quantity of heat alone which determines the elastic force.

267. We believe that in practice Mr. Hornblower was not able to obtain any greater effect from the application of the expansive action in

two cylinders, than Mr. Watt did in one cylinder. In 1791-2 he erected an engine in Cornwall, at Tin Croft mine, of which the large cylinder was twenty-seven inches diameter, and worked with a stroke of eight feet long, and the small cylinder twenty-one inches diameter, working with a six-foot stroke. The only account we have been able to obtain of the performance of this engine is from a pamphlet published by Thomas Wilson, an agent of Messrs. Boulton and Watt, professedly with a view to prevent the introduction of Mr. Hornblower's engines into that country, in which he makes it appear that it raised only 14,222,120 lbs. of water one foot high with each bushel of coals.

268. In Mr. Hornblower's own account of his engine, in Gregory's Mechanics, he informs us that an engine was erected in the vicinity of Bath, some years since, on this principle, and under very disadvantageous circumstances. The engine had its cylinders nineteen inches and twenty-four inches diameter, with lengths of stroke in each suitable to the occasion, viz. six feet and eight feet respectively. The condensing apparatus was very bad, through a fear of infringement on Mr. Watt's patent; and the greatest degree of vacuum which could be obtained was no more than twenty-seven inches of mercury. The engine worked four lifts of pumps to the depth of 576 feet, 4500 lbs. fourteen strokes in a minute, six feet each, with a cylinder six feet long, and nineteen inches diameter, with a great deal of inertia and friction in the rods and buckets; some of the latter of which were not more than three inches and a half diameter: and this it did, under all these disadvantageous circumstances, with seventy pounds of coal (light coal) per hour.

269. To reduce this to the standard of one foot high we must put the load 4500 lbs. \times 6-foot stroke = 27,000 lbs. which the engine raised one foot high at every stroke; 27,000 lbs. \times 14 strokes per minute = 378,000 lbs. raised one foot high each minute; 378,000 \times 60 = 22,680,000 lbs. raised one foot high per hour, or with 70 lbs. of coals. As the coals are stated to be light, we will take them at only 84 lbs. per bushel, instead of 88 lbs., as Mr. Smeaton did, and say as 70 lbs. : 22,680,000 lbs. \therefore 84 lbs. : 27,216,000 lbs. of water raised one foot high with a bushel of coals, which is a very good performance, but not greater than Mr. Watt's.

270. In this engine Mr. Hornblower says that two remarkable circumstances presented themselves to show the advantages of this application of the principle: the one was, that the man who attended the engine would sometimes detach the smaller cylinder from the beam, and work only with the large one, and then the boiler would scarcely raise steam enough to keep the engine going; but no sooner was the small cylinder-rod attached to the beam, than the engine resumed its wonted activity, and the steam would blow up the safety-valve.

271. The next circumstance is, that when the detent, which kept the exhausting-valve shut, happened to miss its action, the piston would be checked, as it were, not being permitted to rise through the whole of the returning stroke;

and it would, as by an instinctive nature, come down again and again, until the detent performed its office, which is a practical argument for the power of the engine at the termination of its stroke.

272. In 1792 Mr. Hornblower made application to parliament for an extension of the term of his patent, but it was not granted: and he was prosecuted by Messrs. Boulton and Watt for infringement on their patent in using the condenser and air pump. We believe none of these engines have been erected since the expiration of Mr. Watt's patent in 1800, until Mr. Woolf took up the subject of double-cylinder engines.

273. So early as the year 1759 steam appears to have been thought of as a *motive power to wheel-carriages*. In a note to the last edition of Robison's Mechanical Philosophy, Mr. Watt states, 'My attention was first directed, in the year 1759, to the subject of steam engines, by the late Dr. Robison, then a student in the university of Glasgow, and nearly of my own age. He, at that time, threw out an idea of applying the power of the steam engine to the moving of wheel-carriages, and to other purposes; but the scheme was soon abandoned, on his going abroad.' Mr. Watt, it appears, soon after made an experiment with steam acting by its expansive force, but relinquished the idea of constructing an engine upon this principle: 'I, however,' says he, 'described this engine, in the fourth article of my patent, in 1769; and, again, in the specification of another patent, in the year 1784, together with a mode of applying it to the moving of wheel-carriages.'

274. For many years subsequent to this, the improvement of the steam engine, acting by condensation, seems to have wholly occupied the scientific world; and the use of steam, acting by its elastic force, entirely abandoned or neglected. Mr. Hornblower had a patent, for the application of steam, acting both by its expansive force, and by condensation; but it is to Messrs. Trevithick and Vivian that we owe the introduction of the steam engine, acting solely by the expansive force of the steam. In March, 1802, they obtained a patent for the application of that species of power to propel carriages upon rail-roads.

275. Mr. Woolf, a short time after, made a series of experiments, to develop the law of action of steam, at different degrees of elasticity, which he explained, in his patent of June 7th, 1804, and, since that time, high-pressure steam engines have been much used, in many parts, to economise the fuel.

276. Messrs. Trevithick and Vivian, in the specification of their patent, give a drawing of their engine, applied to move a carriage upon the common roads. The carriage there delineated resembles in form the common stage coaches, used for the conveyance of passengers; a square iron case, containing the boiler and cylinder, is placed behind the large, or hinder, wheels of the carriage, and is attached to a frame, supported from the axles of those wheels. The cylinder was in a horizontal position; and the piston-rod was projected backwards and forwards, in the

line of the road towards the front of the carriage. Across the square frame, supported by the wheel of the carriage, an axle was extended, reaching a little beyond the frame on each side: this axle was cranked in the middle, in a line with the centre of the cylinder, and a connecting rod, passing from the end of the piston, turned this axle round, and produced a continued rotatory motion of it when the piston was moved backwards and forwards in the cylinder. Upon both ends of this axle cog-wheels were fixed, which worked into similar cog-wheels upon the axle of the wheels of the carriages, so that, when a rotatory motion was produced in the cranked axle by the piston-rod, the rotatory motion was communicated to the axle of the larger or hinder wheels of the carriage; and these wheels being fixed upon, and turning round with the axle, gave a progressive motion to the carriage. Upon one end of this axle was fixed a fly-wheel, to secure a rotatory motion in the axle at the termination of each stroke.

277. The four wheels of the carriage were of the usual form, which, turning to different angles with the body of the carriage, directed its motion upon the road; and, in cases where abrupt turns of the road required sudden changes in the direction of the carriage, the toothed or cog-wheels, on either side, could be thrown out of gear, and the opposite wheel made to drive the carriage into the proper obliquity of the road.

278. Upon the periphery of the fly-wheel, a brake was attached, to regulate the descent of the carriage down steep hills. The contrivances, to effect the requisite motions of the various parts of this machine, are extremely ingenious and, considering it as the first which directed public attention to the subject, is entitled to great commendation.

279. The many objections to its application, upon public turnpike roads, may, I presume, have operated in preventing the patentees from carrying it into practice in the manner described in their specification; they, therefore, very properly directed their attention to its use upon rail-roads.

280. Two years after the date of this patent, we find that Mr. Trevithick made an engine in South Wales, which was tried upon the Merthyn Tydvil rail-road. The engine is stated to have had an eight-inch cylinder, with a four feet six-inches stroke, and 'drew after it upon the rail-road as many carriages as carried ten tons of bar-iron, from a distance of nine miles, which it performed without any supply of water to that contained in the boiler at the time of setting out; travelling at the rate of five miles an hour.'

281. As there is no account given of the inclination of the road, we cannot judge of the real performance of the engine. It had, it appears, only one cylinder, and, from what I can learn, did not materially differ, in construction, from that previously described, except in the form of the carriage.

282. The great obstacle to their introduction, at that time, was the supposed want of hold or adhesion of the wheels upon the rails to effect the loco-motion of the engine. Messrs. Trevithick and Vivian, in their patent, recommended

making the external periphery of the wheels rough or uneven, by using projecting heads of nails, bolts, or cross-grooves; or, in case of a hard pull, to cause a lever, bolt, or claw to project through the rim of one or both of the said wheels, to take hold of the ground. But it will appear obvious to any one that this mode of remedying one defect would be the means of producing another; for any projections would not only cause considerable resistance to the progressive motion of the engine, but would also tend to injure the rails of the road.

283. To obviate these defects, Mr. Blenkinsop, of Middleton colliery, near Leeds, in 1811, obtained a patent for the application of a rack, or toothed rail, stretched along the whole distance to be travelled, into which wheels, turned by the engine, worked, and thus produced a progressive motion in the carriage.

284. Fig. 1, plate IX., will convey a pretty correct idea of the mode of action of this kind of engine. RR is a piece of iron of the rails constituting the rail-road, on the side of which are cast the semicircular protuberances or projections 1, 11, &c.: these semicircular teeth project from the side of the rail two or three inches, thus forming a longitudinal toothed rack, which is extended the whole length of the road. *a, a,* are the cylinders, placed within the boiler. The action is communicated by the pistons to the connecting rods *b, b,* which transfer the motion to the cranks *c, c,* turning upon axles attached to the frame of the carriage. Upon the axles on which these cranks are fixed are also fixed the pinion-wheels *d, d,* which are turned round by the cranks; these two pinion-wheels communicate with a larger cog-wheel *e,* in such a manner that both contribute in producing a rotatory motion in it. The axle of this cog-wheel *e* extends to the outside of the frame of the engine, and upon the end of it is affixed the larger toothed wheel *f,* which is thus turned round by the large cog-wheel, and consequently by the action of the engine; and the teeth of this cog-wheel, being made to correspond, will lay hold of the toothed projections on the side of the rail, and a progressive motion of the carriage is thereby effected. The steam, after performing its office in the cylinder, is allowed to escape into the atmosphere, through the pipe *e.* The boiler is cylindrical, and is heated by a circular tube passing through it, terminated at one end by the chimney. The toothed or rack-rail is only laid on one side of the road, the other being common rails. The cog-wheels can be varied in size according to the different velocity with which it is required to travel.

285. By the use of this rack-rail the engine is enabled to ascend acclivities which Mr. Trevithick's engine, from the want of adhesion, could not surmount; accordingly its use is extended.

286. Mr. Blenkinsop, soon after the date of his patent, erected some of his engines, and employed them upon the Middleton colliery rail-road, in sending coals to Leeds, where they have ever since been used.

287. The engine erected by Mr. Trevithick had one cylinder only, and a fly-wheel, to secure a rotatory motion in the crank at the end of each

stroke. An engine of this kind was sent to the north, for Mr. Blackett, of Wylam, but was, for some cause or other, never used upon his rail-road, but applied to blow a cupola at an iron-foundry in Newcastle. Mr. Blackett however had, in 1813, an engine of this kind made, and set upon his rail-road, which worked by the adhesion of its wheels upon the rails. Still the supposed want of adhesion formed the great obstacle to their introduction, and the attention of engineers was directed to obtain a substitute for this supposed defect.

288. In December, 1812, Messrs. William and Edward Chapman obtained a patent for a mode of effecting the loco-motion of the engine, by means of a chain stretched along the middle of the rail-road, the whole length, properly secured at each end, and at proper intervals. This chain was made to wind partly round, or to pass over a grooved wheel, turned by the engine, of such a form that the wheel could not turn round without causing the chain to pass along with it. When this wheel was turned round by the engine, as the chain was fastened firmly at the end, it could not be drawn forwards by the wheel, the carriage was therefore moved forwards in the line of the chain. The carriages containing the goods were attached to the engine carriage, and thus conveyed along the rail-road.

289. At intervals of every eight or ten yards, the chain was secured by means of upright forks, into which it fell when left at liberty; this was for the purpose of taking off the strain from part of the chain, when more than one engine was travelling by it. The chain was prevented slipping, when the grooved wheel was turned round, by friction-rollers pressing it into the groove.

290. Mr. Chapman had one of his engines tried upon the Hetton rail-road, near Newcastle, but it was soon abandoned; the great friction, by the use of the chain, would operate considerably against it, and also its liability to get out of order.

291. In 1813 Mr. Brunton, of Butterley iron-works, also obtained a patent for a mode of accomplishing the loco-motion of the engine without the aid of the adhesion of the wheels upon the rail.

292. Plate IX. fig. 2, is a side view of the engine. The boiler was nearly similar to that of Mr. Blenkinsop—semicircular; there was a tube passing through it, to contain the fuel. The cylinder *A* was placed on one side of the boiler; the piston-rod is projected out behind horizontally, and is attached to the leg *a b* at *a*, and to the reciprocating lever, *a c*, which is fixed at *c*; at the lower extremity of the leg *a b* feet are attached, by a joint at *b*; these feet lay a firmer hold upon the ground, being furnished with short prongs, which prevent them from slipping, and are sufficiently broad to prevent their injuring the road.

293. On inspecting the engraving it will be seen that, when the piston-rod is projected out from the cylinder, it will tend to push the end of the lever, or leg *a*, from it in a direction parallel to the line of the cylinder; but as the leg *a b* is prevented from moving backwards, by

the end *b* being firmly fixed upon the ground, the re-action is thrown upon the carriage, and a progressive motion given to it, and this will be continued to the end of the stroke. Upon the reciprocating line *a c* is fixed at 1 a rod, 1, 2, 3, sliding horizontally backwards and forwards upon the top of the boiler; from 2 to 3 it is furnished with teeth, which work into a cog-wheel, lying horizontally: on the opposite side of this cog-wheel a sliding-rack is fixed, similar to 1, 2, 3, which, as the cog-wheel is turned round by the sliding rack 2, 3, is also moved backwards and forwards. The end of this sliding rod is fixed upon the reciprocating lever *d c* of the leg *d e*, at 4. When, therefore, the sliding rack is moved forwards in the direction 3, 2, 1, by the progressive motion of the engine, the opposite rod 4 is moved in the contrary direction, and the leg *d e* is thereby drawn towards the engine; and, when the piston-rod is at the farthest extremity of the stroke, the leg *d e* will be brought close to the engine; the piston is then made to return in the opposite direction, moving with it the leg *a b*, and also the sliding rack 1, 2, 3; the sliding rack, acting on the toothed wheel, causes the other sliding rod to move in the contrary direction, and with it the leg *d e*. Whenever, therefore, the piston is at the extremity of the stroke, and one of the legs is no longer of use to propel the engine forward, the other, immediately on the motion of the piston being changed, is ready, in its turn, to act as a fulcrum or abutment for the action of the moving power, to secure the continual progressive motion of the engine.

294. The feet are raised from the ground during the return of the legs toward the engine, by straps of leather or rope fastened to the legs at *f f*, and passing over friction sheeves, moveable in one direction only, by a ratchet and catch worked by the motion of the engine. The feet are described of various forms in the specification, the great object being to prevent them from injuring the road, and to obtain a firm footing, that no jerks should take place at the return of the stroke, when the action of the engine came upon them; for this purpose they were made broad, with short spikes to lay hold of the ground.

295. In a communication to the *éditor* of the *Repertory of Arts*, vol. 24, the patentee gives an account of an experiment made with one of those engines, which he termed his mechanical traveller; the boiler was of wrought-iron, five feet six inches long, three feet diameter; the step was twenty-six inches long, the piston-rod having a stroke of twenty-four inches; the weight of the whole 45 cwt. 'The machine being placed on a rail-way, I first ascertained the power necessary to move it at the rate of two miles and a half in an hour, which I found to be eighty-four pounds. I then applied a chain to the hinder part of the machine, by which, as the machine moved forward, a weight was raised at the same time and rate, and found that, with steam equal to forty or forty-five pounds pressure on the square inch, the machine was propelled at the rate of two miles and a half per hour, and raised perpendicularly 812 lbs. at the same speed, thus making the whole power equal to 896 lbs. at two

STEAM ENGINE.

J. Shury sculp.

miles and a half per hour, equal to six horses nearly.'

296. About this time Mr. Blackett had considerably improved his engines, and by experiments had ascertained the quantity of adhesion of the wheels upon the rails, and proved that it was sufficient to effect the loco-motion of the engine upon rail-roads approaching nearly to a level, or with a moderate inclination. His rail-road was a plate rail, and would consequently present more friction or resistance to the wheels than an edge-rail; and, on that account, the amount of adhesion would be greater than upon the latter rail; still the credit is due to Mr. Blackett, for proving that the loco-motion could be applied by that means alone.

297. The first attempt of Messrs. Trevithick and Vivian failed; and, though this was no doubt owing to the imperfect construction of the engine, yet it appears that the cause was partly, if not wholly, attributed to the want of adhesion to obtain loco-motion; and hence we find the engineers attempting to produce other means of loco-motion. Mr. Blenkinsop, by means of a cog-rail; Mr. Chapman, by the chain; and Mr. Brunton, by means of moveable legs.

298. It was, however, a question of the utmost importance to ascertain if the adhesion of the wheels of the engine upon the rails were sufficient to produce a progressive motion in the engine, when loaded with a train of carriages, without the aid of any other contrivance; and it was, by the introduction and continued use of them upon the Wylam rail-road, that this question was decided: and it was proved that upon rail-roads nearly level, or with very moderate inclination, the adhesion of the wheels alone was sufficient, in all the different kinds of weather, when the surface of the rails was not covered with snow.

299. Mr. Hedley states that they first tried, by manual labor, how much weight the wheels of a common carriage would overcome without sloping, or slipping ground, upon the rail; and, having found the proportion it bore to the weight, they thence ascertained that the weight of the engine would produce sufficient adhesion to drag after it, upon their rail-road, a requisite number of waggons.

300. The first engine applied upon the Wylam rail-road had only one cylinder, with a fly-wheel to regulate the action of the crank; but they were found to be very troublesome, and their action very uncertain. When the engine was stopped, and the crank and connecting rod in the same line, the power of the cylinder had then no effect in turning the crank round, and the engine had to be moved by levers applied to the spokes of the fly-wheel, until the crank formed such an angle with the connecting rod that the engine got sufficient power to produce a rotatory motion and urge itself forward. This occasioned frequent delays, and the irregular action of the single cylinder produced jerks in the machinery, and had a tendency to shake the machine in pieces; for some time, however, the whole of the coals was taken down the rail-road by the use of this kind of engine.

301. In a preceding page we took occasion to furnish our readers with the earliest attempts at

steam-navigation in this country; the construction of a modern steam-boat, as well as the attempts at improvement from the commencement of the present century, properly find a place after our description of the perfect steam engine.

302. The first American steam-boat which completely succeeded was launched at New York on the 3d of October, 1807 (five years before the construction of the Comet at Port-Glasgow), and soon after plying between that city and Albany, a distance of 160 miles.

303. In Britain steam-vessels were first brought into use in 1812 upon the Clyde. They were built at Port-Glasgow, Greenock, and Dumbarton, where the art of ship-building had for many years been conducted by carpenters eminent in their profession. When launched they were towed at a very trifling expense up the Clyde to Glasgow, situated in the midst of inexhaustible mines of coal and iron, and where the number of skilful practical engineers and artificers rendered the construction of the engines and machinery easy and the prices moderate.

304. The early experiments were, of course, made upon a small scale. The first steam-boat actually put to use there was the Comet (forty feet keel, ten feet and a-half beam, four wheels, four shovel-shaped paddles on each, with a cistern of fresh water to feed the boiler), built, as already mentioned, by Mr. Henry Bell. She had an engine of only three horses' power, being intended merely for passengers, who, till then, had no other means of conveyance on the river than small row-boats, either quite open or supplied with only an awning to secure them from the weather. Small as this engine was, it rendered the passage certain in one tide; the vessel being able to make head-way even against the wind and in rough weather.

305. The success of the first experiment soon excited competition; and a larger vessel, the Elizabeth (fifty-eight feet on deck, eleven feet beam, with an engine of eight horses' power), was completed in March 1813, and for a time proved very profitable to the proprietors. The third boat, the Clyde, which began plying in July of the same year, was still larger in her dimensions; being seventy feet keel, seventy-five feet on deck, thirteen feet beam, with an engine of fourteen horses' power.

306. At present there are about forty steam-vessels on the Frith of Clyde, some of which sail from Glasgow almost every hour, or half hour, during day-light, to the various ports on the river and the lochs communicating with it; as Dumbarton, Helensburgh, Loch-Long, Rothsay, Loch-Fine, and Campbellton, on the right bank; and Port-Glasgow, Greenock, Gourock, Innerkip, Largs, Milport, Ardrossan, Ayr, Irvine, Girvan, Stranraer, &c., on the left bank. Many of them occasionally visit Islay, Mull, Staffa, Icolmkill, and adjacent islands, during the summer months; and also Londonderry, Coleraine, and other ports of Ireland. Several vessels of larger dimensions are employed as regular packets to Belfast, the Isle of Man, Liverpool, &c., and thus a constant communication between the united kingdoms is maintained. Since 1821 two steam-vessels have regularly sailed from Leith to Aberdeen, calling at several

of the intermediate ports. Five or six steam luggage-boats are constantly employed as lighters and dragers of other boats for the speedy conveyance of goods from Glasgow to the ports of exportation, and occasionally towing large vessels in or out of harbour. The annual voyages of each of these thirty-five vessels may be averaged at 10,000 English miles; consequently the whole sail 350,000 miles yearly, or nearly fourteen times the circumference of our globe.

307. The success of steam-vessels at Glasgow soon excited attention in other quarters, and several of the Clyde vessels were purchased as models. It is worthy of mention that shortly after the time of their appearance on the Clyde, Mr. Lawrence of Bristol established a steam-boat on the Severn, and having carried her to ply on the Thames, the Company of Watermen made such opposition to this innovation that he was obliged to take her back. Now, however, not only are all the chief navigable rivers in Britain thus navigated, but steam-vessels ply regularly from London to Aberdeen, sometimes passing the Pentland Frith.

308. On the Holyhead station, to carry mails between England and Ireland, there are three steam-vessels employed; viz. the Royal Sovereign, 210 tons, two forty-horse engines; the Meteor, 190 tons, two thirty-horse engines; and the Ivanhoe, 165 tons, one fifty-six-horse engine. They have answered the purpose much better than sailing vessels; as a proof of which, during the last year the latter were employed, exactly 100 Irish mails arrived in London late; while, during the nine months after the steam-boats were first established, only twenty-two arrived late; and that winter happened to be extremely boisterous. These boats use sails occasionally, and go to sea when sailing vessels dare not leave port. The average passage of the Royal Sovereign from Houth to Holyhead is six hours fifty-seven minutes; from Holyhead to Houth seven hours thirty-six minutes. Of the Meteor, from Houth to Holyhead, seven hours four minutes, and back, eight hours thirteen minutes. The average passage is half the time in which the average passage of sailing vessels used to perform the voyage. The shortest passage was, from Houth to Holyhead, five hours thirty minutes; which, the distance being about seventy-three miles, is nearly twelve miles an hour.

309. It is difficult to say what is the maximum speed of steam-vessels. Several of those between London and Margate make the voyage in seven hours and a half, a distance of eighty-four miles. The Hero made the voyage, wind and tide in her favor, in six hours sixteen minutes. The Eclipse, from Belfast to Greenock, 120 or 130 miles, has been known to come in nine hours; and, on one occasion, having about 3000 square feet of canvas set, besides the engine at work, she came from Ailsa to Greenock at the rate of nine miles. The Henry Bell, a new steam-trader between Glasgow and Liverpool, has delivered goods at various warehouses in Glasgow several hours before the invoices, or advice of the shipment, had arrived in course of post. The New York steam-vessels run up to Albany, 160 miles, in twenty-one hours, and down in nine-

teen; never in less than nineteen. They go from Newhaven to New York, ninety miles, in six hours and a half without sail; being nearly fourteen miles per hour.

310. At present steam-boats frequently ply between London and Dieppe, Rouen, Havre de Grace, Cadiz, Corunna, Alicant, Vigo, Lisbon, and other ports of France, Spain, and Portugal. One was lately established between Naples and Leghorn and Genoa, but soon abandoned, owing to the oppression of the quarantine laws and the rapacity of the government of the Two Sicilies. Another steam-vessel was launched by an American gentleman on the Lake of Geneva, but, being a very bad sailer, it is about to be replaced by another. Every season they are becoming more numerous, and adventurous in sailing to greater distances and through heavier seas; such as the Bay of Biscay, the Mediterranean, the Baltic, the Gulfs of Finland, Bothnia, &c. A steam-packet, carrying the mail, now sails between Kiel, in Holstein, and Copenhagen. In the Adriatic, the Carolina goes every second day from Venice to Trieste, and the Eridano to Pavia; the latter voyage being usually accomplished in thirty-seven hours. The Royal George steam-packet makes her passage from Portsmouth to Corunna in from sixty to sixty-four hours; a distance of between 400 and 500 miles.

311. Having thus endeavoured to give a sketch of the origin and progress of steam-navigation, we shall now proceed to describe the form and parts of a steam-boat (suppose of 100 tons), and to some other details calculated to furnish a more particular view of the present state of steam-navigation in Britain and other countries.

312. Fig. 1, plate X., is an elevation; fig. 2, a longitudinal section; fig. 3, a ground plan. The same letters refer alike to the respective parts of each figure: A the two boilers with their two manhole doors, one to each; B the chimney; C the steam pipes; D, D, the cylinders of the two engines; E, E, the two air pumps; F the side lever; one on each side of each engine; G, G, the crank of the paddle-wheel shaft; H the rod that works the steam valves or hand gear, moved backward and forward by an eccentric wheel on the shaft; I the nozzles; K pillars of the framing; L L the area where the fireman stands to put coals into the furnace; M M place where the coals are stowed away; N, N, the paddle-wheels and covers; O ladies' parlour; P principal cabin; Q second cabin, having each a raised lantern or sky-light besides the lateral windows of P and Q; R steward's room; S breakfasting room; T, T, refreshment rooms for the second cabin passengers; U small boat ready to be let down on an emergency; V rudder; W, W, seamen's beds; X X space for lumber or spare fuel. The fireman stands in the space L L; an iron trap-ladder leads down to it from the deck, flush with which are two horizontal gratings for the admission of fresh air to himself and the fire; his coals are built up behind him, and he brings down only a few lumps at a time, which he breaks into small pieces as required. The chimney B is a series of sheet-iron cylinders riveted at the joints and slipped the one over the other. Each boiler has a flue within making various convolutions under

the surface of the water; through which the smoke and flame pass until they enter the chimney.

313. These wheels being ponderous, acquire sufficient momentum to turn the crank and supersede the necessity of a fly. The air-pump, feed-pump, and occasional cold water pump, are wrought by rods from F, F, the side horizontal levers. To prevent the waste steam of the boilers from annoying the passengers a pipe conveys it into the chimney. Besides this a waste steam valve is within reach of the engine-man, who loads and unloads it as he finds necessary. It is a curious fact that a great flow of steam into the chimney prevents black smoke from issuing from it, which otherwise would. The paddle-wheels are firmly wedged on their shaft, and whatever pressure they exert against the water causes an equal re-action on the vessel, which is thus impelled either forwards or backwards according to the direction of circumvolution.

314. The principal cabin is painted and otherwise tastefully fitted up, and furnished with a stove, the chimney of which rises up through the deck. The second cabin occupies the fore-end of the vessel, and is also completely furnished, less elegantly. Small steam-boats from thirty tons upwards are generally laid out much in the same way, only varying according to the nature of their employment. When intended for sea voyages a great part of the internal space is allotted for sleeping births.

315. The following is an alphabetical list of steam-vessels built in Britain from 1813 to 1823:—

When built.	Names of Vessels.	Tonnage.	Engines.	Horse Powr.
1822	Aaron Manby	140	1	28
1821	Abbey . . .			
1819	Active . . .	83	1	10
1816	Ætna (double vessel) . . .	75	1	20
1820	Aire and Calder	110	1	35
1816	Albion . . .	92	1	22
1818	Albion . . .	75	1	24
1822	Albion . . .	160	2	60
1815	Argyle . . .	88	2	32
1821	Arrow . . .	130	2	40
1820	Belfast . . .	190	2	70
1821	Brilliant . . .	160	2	40

316. The Atlas is the largest vessel ever built, and is impelled by three engines of 100 horse power each. This gigantic steam vessel was built at Rotterdam, and launched in the summer of 1828. Her decks are about thirty-five feet longer than a first-rate man of war, and is furnished with four masts. Her engines were constructed at Leige.

317. The vessel Soho is of somewhat smaller dimensions than the American steam-boat, the Chancellor Livingston, plying on the Hudson River between New York and Albany, constructed by Mr. Fulton. The following are some particulars respecting this vessel:—Her keel is 154 feet long; deck 165; thirty-two broad; burden 520 tons; draft of water about seven feet three inches; principal cabin fifty-four feet long, seven high; ladies' cabin, above the other, thirty-six feet long, with closets; forward cabin thirty long, seven high. Permanent sleeping births, in principal cabin, thirty-eight; in ladies' cabin, twenty-four; in fore cabin, fifty-six; in captain's cabin on deck, two; engineers' and pilots, three; fore-castle, six; firemen, cooks, &c., six; total 135. Her engine is of seventy-five-horse power; diameter of cylinder forty inches, length five feet; piston rod eight feet and a half; stroke five feet; boiler twenty-eight feet long, twelve broad, with two funnels; paddle-wheels seventeen feet diameter; paddle-boards, five feet ten inches long, with two fly-wheels, each fourteen feet diameter, connected by pinions to the crank wheel. The machinery rises four feet and a half above the deck. Average rate of sailing, eight miles and one-half to eight and three-fourths an hour. With a strong wind and tide in her favor she has made twelve; but with a strong wind and tide against her not more than six miles per hour. The hands employed on board are—thirteen mariners, eleven cooks, waiters, stewards, &c.; in all twenty-four.

318. This vessel, however, is still much surpassed in size by the Lady Sherbrooke, of 787 tons,

and sixty horse power; being the largest of eight which ply on the river St. Lawrence. This gives thirteen tons for each horse power, whereas in the Soho the same burden has three times as much action applied to it. The American steam-vessels, though fast sailers, are thus impelled by comparatively smaller engines than those built in this country.

319. It appears from the Report of the Select Committee of the House of Representatives, for session 1817, that there were then seventeen large steam-boats in constant employment on the American rivers, besides ferry-boats. But since that time they have increased so rapidly that there was in 1823 about 300.

320. The following are the names of thirty-five vessels, and their tonnage, plying on the Mississippi and its tributary rivers alone; viz. Alabama, 200 tons; Buffalo, 300; Cedar Branch, 250; Cincinnati, 120; Constitution, seventy-five; Eagle, seventy; Etna, 390; Exchange, 200; Experiment, forty; Frankfort, 320; General Jackson, 200; General Pike, 250; Governor Shelby, 120; Harnot, forty; Hecla, seventy; Henderson, eighty-five; Independence, 300; James Monroe, ninety; James Ross, 320; Johnston, eighty; Kentucky, eighty; Louisiana, fifty-four; Madison, 200; Maysville, 150; Napoleon, 332; Ohio, 443; Paragon, 400; Rifleman, 250; Rising States, 150; St. Louis, 220; Tamerlane, 320; Vesta, 100; Vesuvius, 390; Volcano, 250; Washington, 400; in all 7259 tons.

321. Belonging to some of the States there are steam frigates and ships of war carrying guns, some of them 100 pounders. These vessels are thirteen feet thick in the sides, of alternate layers of oak and cork; are so constructed that they can eject boiling water on their enemies; and there are cases of cutlasses and pikes which project from their sides and draw back again every fifteen seconds.

322. The Savannah, of 350 tons, was the first steam-vessel that crossed the Atlantic. She arrived at Liverpool on the 20th of June, 1819, in twenty-one days from land to land, eighteen of which her engine was going; her daily consumption of coal was about ten tons, so that she must have had at least 200 on board, leaving 150 for the weight of engine and cargo. Her paddles were occasionally taken off when she sailed by wind; and the whole of the paddle-wheels were capable of being taken to pieces and shipped in case of bad weather. As the distance is not much short of 4000 miles, she must have averaged nearly 200 per day.

323. By far the greatest number of steam-vessels use low pressure engines. A larger proportion of American vessels have high pressure engines than in this country. High pressure engines are wrought with steam of a great variety of strengths, from thirty to 160 lbs. per square inch. Some engineers assert that it is capable of being used at 1000 lbs. The steam is not condensed, but, after having acted on the piston, is allowed to blow off into the air. The diameter of their steam cylinders may be made of any size proportioned to the strength of the steam used. Thus, when it is 160 lbs., the area of the

cylinder may be only a sixteenth part of the area of one using steam of ten pounds; consequently, a five-inch cylinder wrought with such strong steam will be equal in power to a twenty inch cylinder wrought with such weak steam. High pressure engines require neither air-pump, conductor, nor the parts therewith connected; and, as the volume of steam used is in proportion, their boilers may consequently be much smaller. Hence these engines occupy less room and tonnage, and require somewhat less fuel; but the risk of explosion is considerable. Were it otherwise they would be very valuable at sea, because their power can be increased on emergencies by merely increasing the fire, whereas the power of condensing engines is much more circumscribed and confined to their original construction. The free effective power of large low pressure engines is about eight or nine pounds per square inch of their steam pistons, and of small ones, under thirty horses, only seven or eight.

324. It is remarkable that, after the first successful trial, very little improvement has been made in the construction of steam-vessels. Experience has only fixed the suitable proportions of the several parts. Much, however, still remains to be done. The great objects wanted are to increase the power of the engine; to avoid the waste of force in the play of the paddles; and to render their action more equable. Notwithstanding the number and variety of steam engines which have been erected in this island, it is truly surprising that some of the most important points of theory should be left uncertain and subject to dispute. We have neither ascertained exactly the density of steam formed under different pressures, nor the quantity of heat absorbed in its formation. Most of the conclusions of engineers are drawn rather from analogy than from facts; and a new set of experiments on steam, conducted with scrupulous attention, and on a comprehensive plan, are much wanted at present to guide all our practical operations. It seems probable that the most economical engines, on the whole, are those which work under a high steam pressure, though the statements given by different authors cannot be easily reconciled. The vapor of other fluids has sometimes been proposed instead of the steam from water. It would be an important object gained if the same elastic force could be created with less expense of heat. The prodigious consumption of coals by the boilers proves a great hindrance to the extension of steam-navigation. The store of this ponderous species of fuel required for the supply of the engine in a distant voyage, would occupy the whole tonnage even of a large vessel. The Rapid, of 130 tons burden, and sixty-horse power, required nearly a ton of coals every two hours, and could not therefore continue at sea above eleven days; and we have seen that the Savannah, which crossed the Atlantic, consumed ten tons of coals every day, or 210 tons during the passage of twenty-one days, leaving only 140 of surplus tonnage. Unless some great discovery, indeed, be made on the concentration of heat, we shall never despatch steam-packets directly to the East or West Indies.

325. The first objection which occurs to the use of wheels for propelling the vessel, is, that there is a great waste of power. The wheel, at every point of its circumference but one, is either ascending or descending. Each of the arms has to be immersed at a considerable expense of power, and the effect of its application to the water, in this direction, would be, to lift the vessel out of the water, as much as to push it forward upon the surface, were it not that the force necessary to lift another of the arms out of the water is equal to that which is required to immerse the former. In other words, the tendency which the descending arm has to elevate the vessel is counteracted by the operation of the ascending arm, which tends to depress it. In short, the space in which the revolution of the wheel is of any use in forwarding the vessel, is very small. One-fourth of the power, steadily applied in a horizontal direction, would produce greater effects.

326. The next disadvantage attending the use of wheels is, that the whole force is applied to the water too close to the sides of the vessel. It is true that this is an objection common to all the different methods yet put in practice; but in the case of wheels, especially as they are generally placed nearly as forward as the bow of the vessel, the effect is to bring a current against the head of the vessel, which impedes its progress, and occasions great waste of power.

327. The form and number of paddles attached to each wheel, as well as their velocity, has been so fully discussed by Mr. Tredgold, as to put the whole matter in the clearest light.

328. In still water, it may be assumed that the resistance of the same vessel is sensibly proportional to the square of the velocity; the difference from this law being too small to produce a sensible effect within the range to which the velocity is limited in practice. Therefore, if a be the force that will keep the boat in a uniform motion at the velocity u , the force that will keep it in motion at the velocity v will be found by this analogy.

$$u^2 : v^2 :: a : \frac{a v^2}{u^2} = \text{the resistance at the velocity } v.$$

Now this force acts with the velocity v ; hence the mechanical power required to keep the boat in motion, at the velocity v , will be $\frac{a v^3}{u^2}$.

329. Whence it appears that the mechanical power, or the power of a steam engine to impel a boat in still water, must be as the cube of its velocity. Therefore, if an engine of twelve horses' power will impel a boat at the rate of seven miles an hour in still water, and it be required to know what power will move the same boat at ten miles per hour, it will be $7^3 : 10^3 :: 12 : \frac{10^3 \times 12}{7^3} = 35$; or an engine of thirty-five horses' power.

330. This immense increase of power, to obtain so small an increase of velocity, ought to have its influence in fixing upon the speed of a boat for a long voyage, and its proportions ought to be adapted for that speed, with a proper ex-

cess of power for emergencies. A low velocity should be chosen, where goods as well as passengers are to be conveyed. Our example places this in a striking point of view; for, to increase the velocity of the same boat from seven to ten miles per hour, requires very nearly three times the power, and, of course, three times the quantity of fuel, and three times the space for stowing it, besides the additional space occupied by a larger engine; consequently, if seven miles per hour will answer the purposes of the trade the vessel is to conduct, the advantages of the lesser speed must be evident.

331. According to the principles we have calculated upon, the power required to give a boat different velocities in still water will be as follows:—

Miles per hour.	Horses' power.
3	5½
4	13
5	25
6	43
7	69
8	102
9	146
10	200

332. In short voyages the extra quantity of engine room, and tonnage for fuel, is not so objectionable; but, in a long voyage, it reduces the useful tonnage to so small a proportion as to render it doubtful whether such vessels will answer or not. The consumption of fuel to produce a given effect is much greater than in engines on land; and, perhaps, much in consequence of the imperfection of the draught of the chimney, and the limited space for the boiler. The former might be easily remedied by an artificial blast, directed so as to force the flame to expend its heat on the boiler. And, while on this subject, it well deserves the attention of those who wish to improve steam-boats, to adopt some more effective methods of confining the heat to its proper object, and particularly where the engineer and firemen are exposed to it.

333. When the paddles of a steam-boat are in action there is a point in each paddle wherein, if the whole re-action of the fluid was concentrated, the effect would not be altered; this point may be called the centre of re-action. It has not been determined for the case under consideration, but may perhaps form a subsequent object of research.

334. We suppose the fluid to be at rest, and the velocity of the centre of re-action to be V , and the velocity of the boat to be v ; then $V - v$ is the velocity with which the paddles strike the water. Or the difference between the velocity of the paddles and the velocity of the boat is equal to the velocity with which the paddles act on the water; hence, when these velocities are equal, the paddles have no force to impel the boat; and, if the paddles were to move at a slower rate, they would retard it. Now, as $(V - v)$ is the velocity, the force of the re-action will be as $(V - v)^2$; for this quantity is proportional to the pressure which would produce the velocity $V - v$. But, during the action of the paddle, the water yields with a velo-

city $V - v$; and since the velocity of the boat is v , the effective power is as $V - v : v : (V - v)^2 : v(V - v)$. And the effect of this power in a given time is a maximum when $v^2 (V - v)$ is a maximum, that is, when $2V = 3v$, or when the velocity of the centre of re-action of the paddles is one and a half times the velocity of the boat.

335. It is desirable that the action of the paddles should be as equable and continuous as possible, unless they be arranged so that the variation of the power of the engine may coincide with the variation in the action of the paddles. But, in attempting to render the action of the paddles equable, their number ought not to be increased more than can be avoided, because there is not then time for the water to flow between them, so as to afford a proper quantity of re-action, neither do they clear themselves so well in quitting the water. If we suppose $W L$, plate VI. fig. 4, to be the line the water would assume when at rest, the most favorable arrangement with the smallest number of paddles appears to be to make the paddle A of the wheel A just entering, when the preceding one B is in a vertical position, and the one C quitting the water. This arrangement allows time for the water to flow between, and for it to escape from the retiring paddles. If a smaller number be employed, there will be a short interval during which none of the paddles will be in full action. The utmost variation will be between the positions of the wheels A and B , fig. 5, and an intermediate position is shown by the wheel C . I have not attempted to represent the actual state of the surface of the water during the motion of the paddles, for, unless it were done with accuracy, according to nature, it is better undone; but the form of the surface will not materially affect the conclusions.

336. To determine the radius of the wheel, or the depth of the paddles, when the number of the paddles is given, becomes an easy problem, when the preceding conditions are to be adhered to. For, put $A O$, fig. 6, the radius $= r$, and x the depth $A a$ of the paddles, and n their number. Then $\frac{360^\circ}{n}$ the angle $A O B$ contained between two paddles, and $r \cos. \frac{360^\circ}{n} = O a$; the cosine of the angle being the depth from the centre of the wheel to the surface of the water; and

$$r \cos. \frac{360^\circ}{n} = r - x, \text{ or,}$$

$$r \left(1 - \cos. \frac{360^\circ}{n} \right) = x = A a, \text{ the depth of the paddles.}$$

$$\text{Also } \frac{x}{1 - \cos. \frac{360^\circ}{n}} = r = A o, \text{ the radius of the}$$

wheel.

From these equations we have the following rules, viz. To find the radius of the wheel, when the number and depth of the paddles are given. Divide 360 by the number of paddles, which will give the degrees in the angle con-

tained between the two paddles. From unity subtract the natural cosine of the angle, and the depth of the paddles divided by the remainder will give the radius of the wheel.

337. Thus, if the number of paddles be eight, and their depth one foot and a half, then $\frac{360}{8} = 45^\circ$, and its cosine is $\cdot 7071$, therefore

$$\frac{1.5}{1 - \cdot 7071} = 5.12 \text{ feet, the radius of the wheel.}$$

Again, if the number of paddles be seven, and their depth 1.5 feet as before, then $\frac{360}{7} = 51^\circ 25'$

and its cosine is $\cdot 6234$, consequently $\frac{1.5}{1 - \cdot 6234} =$ four feet.

338. Both divisions are represented in the previous fig. and it may be remarked that, when the depth of the paddles is fixed upon, the greater number of paddles should have the preference, because the first impression on the water is then less vertical. The difference is easily seen by comparing the angles at which the paddles A and a , strike the water. It will also be observed that the larger wheel must have less tendency to throw the water up behind at C .

339. It is obvious that, by enlarging the wheel, the obliquity of the action on entering the water may be reduced; but it also may be done by lessening the depth of the paddles, as will be evident from the other figs., where the angles are the same in both wheels; hence it is useful to be able to find the depth, and, if the number of the paddles and the radius of the wheel be given, the depth may be found by the following rule:—

340. Multiply the radius of the wheel by the difference between unity and the natural cosine of the angle contained between two paddles, and the product is the depth required. Suppose the radius is to be 4.5 feet, and that there are to be eight paddles; then $4.5 (1 - \cdot 7071) = 1.318$ feet for the depth of the paddles.

341. Eight paddles is as small a number as ought to be adopted, and, where large wheels can be admitted, nine or ten might be used with advantage; but, where many paddles are employed, the wheels must necessarily be of large diameter, to keep them narrow. The advantages of wheels of large diameter consist in the favorable direction they strike the water, and also quit it; the paddles are also more distant from one another, and, while they have more re-action on the water, they splash it about much less; the weight of the wheel also renders it more effective as a regulator of the forces acting upon it. On the contrary, there are some strong practicable objections to very large wheels for sea-vessels; they give the force of the waves a greater hold on the machinery; they are cumbersome and unsightly; and they raise the point of action too high above the water line; so that the choice requires both experience and judgment.

342. The best position for the paddles appears to be in a plane passing through the axis, as represented in the figures; if they be in a plane which does not coincide with the axis, they must either strike more obliquely on the fluid in entering, or lift up a considerable quan-

tity in quitting it. With respect to the shape of the paddle, it is clear that it should be such that the resistance to its motion should be the greatest possible. These conditions appear to be fulfilled in a high degree by the simplest of all forms, the plane rectangle; but we might learn much from a judicious set of experiments on this subject.

343. As there is some variation in the force of re-action against the paddles, it may in some measure be compensated by making its periods coincide with the variation in the force of the engine. To effect this, the stroke of the engine should be made in the same time as is occupied by that part of the revolution of the paddle-wheel which is expressed by a fraction having the same number of paddles for its denominator, and the piston should be at the termination of its stroke, when one of the paddles is in a vertical position. For, when one of the paddles is in a vertical position, as in the wheel A, the re-action is the least; and it is greatest when two paddles are equally immersed, as in the wheel B, at which time the force would be acting at right angles to the crank.

344. Having shown the power that is necessary to keep a boat in motion in still water, it will be some advantage to resume the enquiry in the case where it moves in a stream or current; and, for that purpose, let v be the velocity of the boat, and c the velocity of the current; a being the resistance, when the boat is in motion with the velocity u .

345. When the resistance to be overcome, to give the boat the velocity v , is, when the motion is with the stream, $u^2 : (v - c)^2 :: a : \frac{a(v - c)^2}{u^2}$

And, when the boat moves against the stream as $u^2 : (v + c)^2 :: a : \frac{a(v + c)^2}{u^2}$. Hence the power

in either case is expressed by $\frac{a v (\pm c)^2}{u^2}$. The

upper sign to be attended to when the motion is with the current, and the lower sign when it is against it. When c , the velocity of the current, is nothing, the resistance is the same as before. But the resistance in still water is not the mean between the resistances in the direction of the current and against the current; consequently, the mean rate of a boat, which alternately goes with and against a current, must be less than the mean rate in still water. The mean resistance is $\frac{a v (v^2 + c^2)}{u^2}$, while the resistance in still water is

only $\frac{a v^3}{u^2}$, and the difference between these is $\frac{a v c^2}{u^2}$; a quantity depending on the velocity of the

current; and, for any particular case, should be calculated from the mean motion of the current.

346. When a boat advances with a current, the velocity with which the paddles act on the water will be $V + c - v$; and when the boat moves against the current it will be $V - c - v$; consequently, in either direction, it is $V \pm c - v$; and the force of re-action $(V \pm c - v)^2$.—But the effective resistance of the boat is as $V \pm c - v : v :: (V \pm c - v)^2 : v (V \pm c - v)$;

and its effect in a given time is a maximum when $v^2 (V + c - v)$ is as a maximum; that is when $V = \frac{3v + 2c}{2}$, or when $V = 1.5v + c$

Also, $\frac{2(V + c)}{3} = v$.

347. When $c = 0$, or the boat moves in still water, $\frac{2V}{3} = v$, the same as before, and the mean

between moving against and with the current is $\frac{2V}{3} = v$ also; therefore, where the velocity can-

not be changed to suit the circumstances, this will be the best proportion for all cases. Where the force of a current is considerable, it would be extremely desirable to have the power of altering the velocity of the wheels; and it is not proper that it should be done by any change in the velocity of the steam-piston; because, whatever change is made in its velocity, must affect the power of the engine. There is no difficulty in adopting such a train of mechanism as would produce the alteration of velocity required, and yet be as strong and durable as the ordinary combination, and not at all expensive, compared with the object to be gained by introducing it. It will only be necessary to provide for an increase of velocity; for, when the boat goes with the stream, the rate of the paddles is already too great; whereas, when a boat moves against the current, both an increase of velocity of the wheel and an increase of surface of paddle is necessary, to maintain the mean rate.

348. We will close this part of our subject with a view of the velocity a boat may be expected to acquire, when the power is the same:—Let P be

the power of the engine, then $\frac{a v (v \pm c)^2}{u^2} = P$

349. Put the ratio of the velocity of the current to the velocity of boat as 1 : n ; that is, $1 : n :: v : c = n v$; whence we have

$$\frac{a v^3 (1 \pm n)^2}{u^2} = P, \text{ or } v = \left(\frac{P u^2}{a (1 \pm n)^2} \right)^{\frac{1}{3}}$$

350. If the boat moves in a current of which the velocity is n times the velocity of the boat, then we shall have

	Miles per hour.	Miles per hour.
With the stream	.4	8
	2.2	6.6
	1.53	6.12
Still water	.00	5.00
Against the stream	1.08	4.34
	1.38	4.16
	1.92	3.85
	2.38	3.58
	3.17	3.17

This table shows that a power capable of moving a boat at the rate of five miles per hour in still water, will only move it at the rate of a little more than three miles per hour against a current of the same velocity as the boat; and that the speed of the same boat would be eight miles per hour when moving with a current of which the velocity is four miles per hour. It should be remarked that these calculations suppose the

area of the paddles and their velocity to be adjusted to the maximum proportions in each case ; were it otherwise, the velocity with the current would be increased, and the velocity against the current diminished.

351. There are two or three detached parts of the engine that require a more particular notice than we have yet given. The *governor*, as it is called, furnishes a beautiful illustration of the application of the centrifugal force as a means of regulating the velocity of the engine. Indeed the same law that governs the motions of the planetary bodies is here made subservient to producing the most perfect equilibrium between the various parts of the machine.

352. It is represented in the accompanying diagram, and a rotatory motion is communicated by a gut band passing round a rigger, or pulley fixed upon the fly-wheel shaft, or some other revolving part of the engine, and also round the pulley C; and the relative velocities of the governor and the engine must be

adjusted by such wheel-work, or the respective diameters of the two pulleys. Towards the upper part of the rod or spindle AB two bent levers DEF and GEH are fixed, so that they can both turn or open on the common centre E which is fixed to the spindle ; a heavy iron ball I, I, is fixed to the end of each bent lever, and the upper ends D and G of these levers are attached by connecting links K, K, with joints to the sliding piece M, which slides freely on the square spindle. It follows therefore that while the two balls I, I, lie in contact with the spindle AB, the slider M will be pushed to its greatest possible height upon the rod ; but whenever the balls I, I, are opened out the slider M must be depressed. The weight of the balls keeps them in contact with the spindle, so long as it remains stationary or moves slowly ; but whenever their revolving motion increases, their centrifugal force will drive them to a greater or less distance from the centre : LN is an iron lever turning on the fixed pivot N, while its opposite end enters a groove formed in the sliding piece M ; this is merely for multiplying or increasing the motion produced in M, when necessary ; for, by prolonging the distance between N and L, the end L may be made to move in any required degree. To apply the governor to the regulation of the velocity of the engine, it therefore only becomes necessary to connect the end L of the lever by means of strong wires with the lever of the throttle valve, taking care that that valve shall be quite open when the two balls of the governor are lying close to their spindle ; for then the engine will move at its full speed. By so doing, the balls will instantly separate and raise the end

L of the governor-lever, which, by drawing upon the lever or the throttle valve will partly close it and diminish the speed.

353. The safety-valve being an object of considerable importance, both as regards the utility of the engine, and the preservation of those connected with its management, much attention has been given to its construction ; and to this highly useful appendage we would particularly call the reader's attention.

354. The first engine that was made by Savery was furnished with a steel-yard safety-valve. The accompanying figure will furnish an idea of its arrangement. A the top of the boiler ; B, the safety-valve or plug, made to fit air-tight in the tube or valve-seat beneath. C, the lever working on an axis D, and furnished with a moveable weight E, adjusted to balance the weight of the steam in the boiler.

355. The lever and balance-ball safety-valve employed in all the early boilers appear but little calculated for those engines in which high pressure steam is employed, as the engine-man, in an over anxious zeal for the full performance of the machinery confided to his care, has been frequently known to increase the internal pressure of a large boiler many thousand pounds beyond the resistance to which it was originally proved. To prevent a recurrence of those accidents which first drew the attention of the legislature to this important part of the engine, it appears advisable to enclose the safety-valve in an iron case, of which a section is annexed. The valve B in this case rests upon a conical seat in the boiler A, and is furnished with a series of small moveable plates lettered c, which are employed to increase or diminish the entire weight of the safety-valve, the whole being covered by the box D ; and, as this is pierced with a number of small holes, the steam readily escapes when the expansive force exceeds the resistance offered by the loaded valve.

356. The cylinders of steam engines are frequently surrounded with cases containing steam of the same elasticity as that in the boiler. The water proceeding from the condensation which takes place in the case was for a considerable time allowed to pass off without further use ; but it has subsequently been the practice to return it to the boiler.

357. The object of the case was to prevent condensation taking place within the cylinder. But we shall see that the application of heat in this manner is by no means advantageous. As far as experiments hitherto published afford us a clue we will endeavour, says an ingenious author, to investigate it in the case of the engine at Huel Towan.

357*. M. W. De la Roche and Berard found that the capacities of equal volumes of air under the pressures of 29.2 and 41.7 inches of mercury were nearly as 1 : 1.2396 differing from the ratio of the pressures of densities which is 1 : 1.358.

358. If we suppose the densities and capacities to be in this ratio to each other; then under a pressure of 24.9 inches of mercury 8.983.

29.2	.	.	.	1.000
39.6	.	.	.	1.215
71.15	.	.	.	1.91

359. As air and steam, out of contact with its generating water, follow the same ratio of expansion; in the absence of experiments on the subject, it seems reasonable to suppose that their capacities vary as one another, and consequently that the capacity of the steam in the case—1.910 whilst that of the steam contained in the cylinder at the termination of the working stroke —.8983 for equal volumes; and for equal weights that of the former —.02684 whilst that of the latter —.03607. It consequently requires that 3607 parts by weight of steam, of a pressure equal to that of 71.15 inches of mercury, be cooled, in order to heat 2684 parts of the pressure of 24.9 inches, the same interval of temperature. From the law of Mariotte it follows that the elastic force of a given weight of any elastic fluid, \times the sphere of its action, will give the same quantity, whatever may be the temperature, pressure, or density; provided the whole quantity of heat in the mass suffer no increase or diminution; and hence, friction and capacity disregarded, we obtain the same result, whether a given quantity of water and caloric, in the form of a vapor, act on a surface of eight or eighty inches in diameter.

360. In the use of a steam case it appears that a portion of steam is destroyed in order to communicate to another portion a force so considerably less than what would have been obtained by adding volumes together as the difference between 2684 and 3607. The former representing the effect produced on the steam in the cylinder by the abstraction of heat from the case; and the latter what would have been the effect of the steam condensed in the case had it been employed in the cylinder.

361. But the quantity of injection water will be augmented by the steam within the cylinder acquiring an increased quantity of heat after its admission there; the load of the air-pump being of course proportionally greater; the surface exposed to the cooling influence being enlarged by the application of a case. Mr. Woolf and Mr. Grose usually employ steam cases, which with the upper parts of the boilers, the steam pipes, cylinder, cover, nozzles, &c., are surrounded and covered with from ten to fourteen inches in thickness of ashes, saw-dust, or powdered charcoal.

362. Before the application of this contrivance Mr. Hocking, engineer at the Consolidated mines, states, that the quantity of steam condensed in the case of a ninety inch cylinder, and working with steam of a pressure of about seventy inches of mercury, gave 81.6 cubic feet of water in twenty-four hours.

363. Mr. Sims has recently adopted a plan, which, if it can be so carefully managed by the engine-men as to avoid charring the packing of

the piston, seems preferable to a steam case. It is making the flue, from the boiler to the chimney, around the cylinder. But it is doubtful whether the advantage obtained in the cylinder be not counterbalanced by the increased burden of the air pump.

364. The sudden descent of a weight sufficiently heavy to open the valves of a powerful engine, would be attended with serious inconvenience, was not some expedient resorted to for diminishing its force. To do this, each plunger weight moves in a strong box or case which very nearly fits it; and as this, together with the weight itself, is placed in the cold water cistern, of course this box is always filled with water, which is admitted by a valve opening inwards; when the plunger weight descends, it is therefore resisted by the water, which only permits it to move slowly; but, in its ascent, the valve opens and admits of the most rapid motion, and at the same time prevents any unnecessary load being thrown upon the plug tree. In engines of great power, the weight of the plunger would necessarily be so great as to be very inconvenient, and Messrs Watt and Boulton have therefore most ingeniously applied a small separate steam cylinder and piston for the express purpose of removing the pressure from the valves. The piston rod of this small cylinder, which is usually fixed immediately below the side pipes, is a continuation of the rod by which the valves are connected, and is made steam tight by working through stuffing-boxes. The piston is of the same diameter as the valves to which it is connected, and the steam passages are so continued from the slide-pipes that, when steam is made to press on the upper side of any valve, it is at the same time admitted below the piston, and thus tends to raise that valve upwards with a force exactly equal to that which presses it downwards, consequently the valve moves with the same facility as if it were in the open air. The plunger weights do not therefore require to be of greater weight than what is necessary to overcome the friction of the piston, and the stuffing-boxes of the valve-spindles. In those engines that work with a four-way cock, or sliding regulator, plungers are unnecessary, and indeed cannot well be applied, though the motion they produce is always desirable, because the steam cannot be cut off too suddenly, but should be admitted gradually; for, if its power is too suddenly thrown upon the piston, it may do mischief by its exertions before the vis inertia of the piston and beam are overcome.

365. In 1805 Mr. Job Rider obtained a patent for improvements in the steam engine. These improvements consist, first, in lining the steam cylinder with soft metal, of a sufficient thickness to admit of finishing the inside of the cylinder of such metal, by drawing or boring; secondly, in applying a hollow piston-rod, answering the purpose of an eduction pipe; thirdly, in the order of opening and shutting the valves; and, fourthly, in regulating the speed of the engine by a pendulum. The nature of this latter contrivance is very ingenious, and may be understood from the following description. Upon an horizontal arbor, which we may denominate the

main arbor, are placed three wheels, a drum or barrel, and a pinion: one of these wheels, that is to say, the main wheel, is fitted by means of a socket upon the main arbor, so as to turn round upon it, and has teeth both upon the exterior and interior periphery of its rim. Within the circle of the interior cogs of this wheel, a pinion is fixed to the arbor, its diameter being one-third of the interior diameter of the main wheel; and this pinion has teeth surrounding its convex surface. The moveable barrel turns freely upon the main arbor; its diameter is rather less than the exterior diameter of the main wheel, and it carries a cord, with a weight hanging at its end, acting like a clock-weight. Besides this, the ends of the barrel are pierced with two orifices, each at about half the exterior radius of the main wheel from the arbor, these holes serving as bushes or pivot-holes, wherein an arbor turns, carrying a wheel of which the diameter and number of teeth are equal to those of the pinion: the latter wheel may be called the barrel pinion; its teeth work in the teeth of the pinion, and also in the interior teeth of the main wheel. By these means the barrel may be turned round upon the main arbor, while the arbor itself is turned by the pinion, which is acted upon by the barrel-pinion, at the same time that this pinion acts upon the interior teeth of the main wheel. The external teeth of the main wheel turn the pinion of a scapement wheel and pallets, nearly similar to those in Graham's dead-beat. Near one end of the main arbor there is a ratchet-wheel, and wheel and click; and near the other end a wheel, which is acted upon by an endless screw upon a horizontal shaft, worked by the general operation of the steam engine.

366. This arrangement serves to regulate the rate of the engine's motion; for the turning of the worm wheel, by the general motion of the engine, causes the weight to be raised which hangs to the cord that winds upon the barrel; and this weight is connected to one end of a lever, the other end of which is attached to the steam-valve in such a manner that the degree of opening of that valve depends upon the altitude to which the weight is raised. The aperture of this valve is formed like an inverted cone; and, while this valve shuts and opens twice at every stroke, the lever does not prevent such opening and shutting, but merely limits the extent of the opening by the springing up of a rod connected with it. By this contrivance it happens that when the weight is highest the valve is least opened; and when the weight is lowest the valve is most opened. Hence it is evident that should the engine wind up the weight, by turning the worm faster than the pendulum permits it to descend by the turning of the barrel, the aperture of the valve will be contracted; and vice versa. Little power is lost by these means, and the speed of the engine can be accurately regulated by properly adjusting the length of the pendulum, and the numbers of teeth in the wheels and pinions. As to the ratchet-wheel and click, their sole use is to prevent the weight from drawing the line off the barrel, when the worm-wheel is thrown out of gear.

367. The *air-pump* and *condenser* of the common engine are usually of the same size; if of one-eighth, the capacity of the working cylinder, it will be found sufficient to keep the condenser empty in Mr. Watt's single engine. The best proportion for a double action engine is about two-thirds the diameter of the cylinder and half the length of stroke, the condenser, as in the single engine, being of similar capacity.

368. In Mr. Maudslay's portable engine the condenser is a hollow cylinder, and the air-pump is placed within it, so that there is no necessity for a pipe of communication from the air-pump to the condenser; and in this case a small cistern is fixed over the pump to contain the hot water, the discharge valves being placed in the lid, which thus forms the bottom of the cistern or hot well.

369. In the early engines, on Messrs. Boulton and Watt's construction, the air-pump and condensing-cistern were placed at the outer end of the beam; in which case, the pump-bucket being drawn up by the descent of the piston, the engine required less counter-weight than in the present form, in which the air-pump must be wholly worked by the counter-weight. It was necessary, also, that the parts appropriated to the condensation of steam should be kept as cold as possible; on which account the air-pump and condenser were placed in a cistern of cold water, which, being continually on the overflow, carried off the excess of heat.

370. The mode of condensing by outward cold was not however found sufficient; and Mr. Watt afterwards introduced a small jet of water, the dimensions of the air-pump being so far increased as to extract the injection-water as well as the air.

371. To show the degree of vacuum in the condenser, and consequently the amount of pressure on the piston, a barometer-gauge has been employed. This is justly considered as a most important instrument, though unfortunately for the profit of steam engine proprietors, but little attended to. This gauge is in fact a common barometer tube, of thirty inches in length, with a graduated scale, and connected with the condenser by a small tube furnished with a stop-cock. When the air is expelled from the cylinder this must be closed, otherwise the steam entering the tube would blow the mercury from the cup. On the cock being turned, and the communication opened with the condenser, the exact degree of vacuum will be shown by the height of the mercurial column, which, if the condensation be not complete, or air be admitted, will descend, and on the contrary, if perfect, it will ascend, as in the Torricellian tube.

372. The steam-gauge employed by Mr. Watt consists of an inverted syphon or bent tube of glass or iron, one leg of which is jointed to the steam-pipe, while the other is open to the atmosphere. A quantity of mercury being poured into the tube, it will occupy the lower or bent part, and the surface of the fluid metal in one leg being exposed to the pressure of the steam, while the external air acts upon the other, it is evident that the difference of level of the two surfaces will express the pressure of the steam in

the height of the mercurial column passing up the graduated tube.

373. This gauge is just the reverse of the preceding; the barometer showing the pressure of the atmosphere on a given space of the piston, while the steam-gauge indicates the force of elastic vapor entering from the boiler. It is the duty of the fire-man frequently to look at his gauge, that he may know when to increase the fire in the furnace, and thus a sufficient supply of steam will always be secured to the engine.

374. In the early atmospheric engines, the *working-beam* was composed of a large and almost unhewn tree; but Mr. Smeaton employed a framing of wood for this purpose, which was afterwards much simplified and improved by Mr. Hornblower.

375. In double-acting engines it is usual to have the beam cast in one piece, the extremities being turned in a lathe to form cylindrical pins, upon which are fitted sockets or pieces, having other pins projecting from them to form the points of the parallel-motion and connecting-rod. Thus, there is one pin on each side of the socket, the two links of the parallel-motion being fitted to the two projecting pins at one end, while the double joint of the connecting-rod is fitted on the two pins at the other end of the beam. The advantage of this construction is, that the joints at the ends of the beam become universal joints, having liberty of motion in all directions; and, in some of Mr. Murray's best engines, the same contrivance is applied to the crank-pin and connecting-rod.

376. The following table exhibits the proportions of the parallel-motion and as such is important.

No.	Length of Stroke.	Beam A B.	Coupling Rod D E C B.	Link C E B D.	Bridle-Lever E F.
1	96	147	69	42	78
2	72	120	50	28	96
3	72	110	55	31½	55
4	48	60	41	20	60
5	48	84	38	19	60
6	48	84	36	20	54
7	48	72	41	18	25
8	45·6	76	40	23	36
9	36	60	37	12	15·66
10	24	37	16	9	26
11	23	36	16	12	26

377. The two great links of the parallel motion are each composed of a strap or loop of iron, bent so as to form a double link, in the upper bend of which are two sockets for the pivots at the end of the beam, and at the lower end are two others, for the pivots which project on each side of the piston-rod socket. The brasses of this joint are held in by wedges, put through the two links at the lower end, which, on being driven inwards, tighten the fittings at pleasure.

378. The proper length of the stroke for different engines is not at all settled; Mr. Watt's first engines were made much longer than this table, but of late years they have been made

shorter, and without any adequate reason which we can perceive; for it must be an advantage to a machine to make as few reciprocations as is consistent with a practicable length of cylinders. These differences in the length of stroke do not affect the calculation of powers, because, if the length of the stroke is altered, the number per minute is also changed, and the velocity of the piston is the same; at least it will be always nearly the same as the table for those engines that work a crank and fly-wheel. But it must be observed that these engines move with a greater celerity than the engines for pumping water, because it is necessary to accumulate a considerable velocity in the fly-wheel, or it must be immensely heavy if the piston was to move so slowly as the pumping-engine generally does.

379. The *cylinder* and *piston* being those parts of the engine in which the effective force is more immediately produced, may now claim attention:—

380. The piston of the atmospheric engine is generally made of cast iron nearly fitting the inside of the cylinder, a circular ledge or rim being formed round it to receive the packing, without which the steam would find a passage through the interstices in the cylinder. Mr. Smeaton, who greatly improved the atmospheric engine, coated the under side of the piston with elm or beech planks about two inches and a quarter thick; the wooden bottom being screwed to the iron with a double thickness of flannel and tar, to exclude the air between the iron and the wood. By the adoption of this improvement its property of conducting heat was diminished, and the wood, having been previously jointed with the grain radiating in all directions from the centre, was not liable to expand very materially by the heated steam. This piston was kept airtight by a small stream of water continually falling on its upper surface; but in Mr. Watt's engine he was compelled to effect this by improving the fitting of the piston, the old mode being inadmissible.

381. It is now cast with a projecting rim at bottom, which is fitted as accurately to the cylinder as it can be, to leave it at full liberty to rise and fall through the whole length. The part of the piston above the rim is a little less all round than the cylinder, to leave a circular groove for the hemp which forms the packing. To keep this in its place, a lid or cover is put over the top of the piston, with a ring or projecting part which enters into the circular groove for the packing

b b, and pressing upon it the plate is forced down by screws *a a*, which work into the body of the piston at *c c*. By this means the packing is made to fill the diameter of the cylinder with tolerable accuracy, and to prevent for a time any steam passing between the piston and the cylinder. The connexion with the piston-rod is seen at *n e*. When, however, by continued working the piston became too easy, and so occasioned a waste of steam, it was found

necessary to take off the top of the cylinder to get at the screws, even when fresh hemp or packing was not wanted, and this operation being attended with considerable labor was seldom resorted to by the engine-man till a great waste of steam had taken place. By an improvement on this piston, introduced by Mr. Woolf, this is now effected without taking off the cylinder-cover, except, indeed, when new packing is required.

382. To accomplish this, Mr. Woolf fastens on the head of each of the screws a small cog-wheel or nut, *c, c, c, c, c, c*, and these are all connected together by means of a central wheel *d*, working loose upon the piston-rod in such a manner, that if any one of the screws be turned, a similar motion is given to the remainder, a cap being provided in the upper end of the cylinder screwed down by bolts to make it steam-tight. In a piston thus constructed, there is little difficulty in drawing down the packing, by applying a key to the square head of the projecting screw employed to communicate with the rest. Another method contrived by Mr. Woolf for the smaller pistons differs but little from the preceding in construction. Instead of having several screws, all worked down by one motion, there is in this but one screw, and that one cut upon the piston-rod itself; on this is placed a wheel, the centre of which is furnished with a female screw, which is forced down by means of a pinion furnished with a square projecting head turned in a similar manner to the preceding.

383. For high-pressure engines, however, the metallic piston invented by Mr. Cartwright has the most decided preference. This not only saves the trouble and expense of packing, which must be frequently renewed in all other engines, but also a great deal of steam, on account of the more accurate manner in which it is made to fit the cylinder. This is effected in the following manner:—Two metal rings are accurately ground into the cylinder, so that no steam can pass between their exterior surface and the inside of the cylinder, their upper and under sides are also ground perfectly flat, and applied one upon the other. On the upper ring is placed a plate of metal, rather smaller in diameter than the cylinder, while a similar flat plate is placed below the under ring, both of which, with the rings between, are attached firmly to each other by means of the piston-rod passing through them.

384. A shell being thus formed, the rings are each of them cut into three pieces, and in cutting them such a portion of the metal is taken away as to leave room to introduce between two of the pieces, a spring in form of the letter V, the open end of which is placed outwards, almost close to the circumference; by which means the two pieces, against which the two sides of the spring act, are pressed in the direction of the circumference, against the ends of the third

piece, so that the three pieces are thus kept so uniformly in contact with the cylinder, that the longer the machine is worked the better the rings must fit. To prevent steam passing through the cuts in the lower rings, the solid parts in those upon the upper side are made to fill upon the divisions and springs of the under ones, thus interrupting the communication that would otherwise remain open, and forming a perfect break-joint.

385. A diagram of an improved piston is annexed: and it will be seen that the flexible springs *l, l, l* rest on the rod *S*, and operate on the wedges *o, o, o*, and as such must expand the remaining portions *h, h, h*, so as to ensure the accurate fitting of the piston *r m*. The interior surface of the cylinder in which the piston works requires to be bored with the greatest exactness, though this was but little attended to in the early atmospheric engines, some of them being composed of timber hooped together in the same manner as barrels are constructed. Mr. Watt, in his first attempts at improving the steam engine, employed this material in the construction of his cylinders, though he afterwards abandoned it for those of bored metal; the operation of boring being performed with the greatest precision, by an apparatus invented by Mr. Wilkinson.

386. Mr. Murray has also effected considerable improvements in this part of the engine, and the boring machines employed in his manufactory are of considerable value. They are worked by a separate steam engine, which is never stopped during the operation, as in that case a shoulder or ring would be formed, running completely round the cylinder.

387. In small engines, it is common to place the cylinder within the boiler, in which case no artificial mode of retaining the heat is required; but to this arrangement in those of larger dimensions there are several objections, not the least of which is the frequent repairs that are necessary in the boiler; and a similar effect has been produced by the use of a double cylinder. This was first adopted by Messrs. Boulton and Watt, the outer cylinder or steam-jacket keeping the inner cylinder at the temperature of boiling water, by the action of a partition of steam made to pass between the jacket and the working cylinder, as we have already stated.

388. Before the boiler of a high-pressure engine is set to work, it should be proved effectually, first, by drilling small holes through it at different places, to actually measure the thickness of the metal, and ascertain that it is equal throughout, and then it should be proved by injecting water into it, until the pressure lifts the safety-valve, when loaded considerably more than is intended to be when the engine is set to work, but this proof should not be too severe, because the metal may be weakened, although it is not burst, by the proof; and in consequence may afterwards burst with a much less pressure of steam. At

the same time the engineer, who undertakes to make these engines, should fully inform himself of the real strength of metal boilers of determinate thicknesses, which could be easily done without danger by injecting water into the boilers until they actually burst. We do not know that such experiments have ever been made; and, in those boilers which have been burst by the explosion of steam, the pressure at the moment of the accident has not been known.

389. Mr. Bramah has made several steam engines, in which he employed a four-passaged cock, on a construction somewhat different from the one usually resorted to; the steam from the boiler is made to enter into a hollow at the large end of the cone of the cock, and to pass away to the condenser by a passage at the small end of the cone of the cock, which by this means is always pressed into its seat by the force of the steam acting upon a surface equal to the small end of the cock, from which the pressure is relieved. This keeps the cock always tight; and, to prevent the moveable part from being fixed fast by the pressure, the cone is made much more obtuse than usual.

390. In joining the *flanches* of iron cylinders, and other parts of hydraulic and steam engines, a strong and durable cement is required. The following are receipts for cements proper for such purposes:—Mix boiled linseed oil, litharge, red and white lead together, to a proper consistence; this cement is to be applied on each side of a piece of flannel, previously shaped to fit the joint. The quantities of the ingredients may be varied without inconvenience, only taking care not to make the mass too thin with the oil. It is difficult, in some cases, to make a good fitting of large pieces of iron-work at once, and this renders it necessary sometimes to join and separate the pieces repeatedly before a proper adjustment is obtained. When this is expected, the white lead ought to predominate in the mixture, as it dries much slower than the red. A workman, knowing this fact, can exercise his own discretion in regulating the quantities; but it is safest to have too much rather than too little white lead, as the durability of the cement is no way injured thereby, only a longer time is required for it to dry and harden. When the fitting will not admit of so thick a substance as flannel being interposed, linen may be substituted, or even paper, or thin pasteboard, the only reason for employing any thing of the kind being the convenience of handling. This cement answers well also for joining broken stones, however large. Cisterns built of square stones put together with this cement will never leak or want any repairs; in this case the stones need not be entirely bedded in it; for an inch or even less of the edges that are to lie next the water need only be so treated, and the rest of the joints may be filled with good lime.

391. Another cement, which is preferable to the former for withstanding the action of the steam, is compounded as follows:—Take two ounces of sal ammoniac, one ounce of flour of sulphur, and sixteen ounces of cast iron filings or borings; mix all well together by rubbing them in a mortar, and keep the powder dry. When

the cement is wanted for use, take one part of the above powder, and twenty parts of clean iron borings or filings, and blend them intimately by grinding them in a mortar; wet the compound with water, and, when brought to a convenient consistence, apply it to the joints with a wooden or blunt iron spatula. By considering the affinities of these ingredients, those who are at all acquainted with chemistry, will be at no loss to comprehend that a degree of action and re-action takes place among the ingredients, and between them and the iron surfaces, which at last causes the whole to unite as one mass; in fact, after a time, the mixture and the surfaces of flanches become a species of pyrites, holding a very large portion of iron, all the parts of which strongly cohere together.

392. Another cement of the same kind is made by mixing together two parts of flour of sulphur and one part of sal ammoniac, and making them into a stiff paste with a little water. When the cement is wanted for use, dissolve a portion of the above paste in urine, or in water rendered slightly acidulous; and to this solution add a quantity of turnings or borings sifted, to get rid of the grosser particles. This mixture spread upon or between the flanches of iron pipes, or put into the interstices of other parts of iron work, will in a little time become as hard as stone.

393. Mr. Malam has proposed some important improvements in the construction of rotatory steam engines. The first of these consists in the use of a hollow cylinder or drum, in which the pressure of steam is contrived to drive a leaden piston (as the patentee terms it) round the cylinder; but which piston, by its gravity, always remaining near the lowest part, the steam is impelled upwards against the partition of the cylinder, and consequently forces it round upon its axis.

394. Two standards support the arms or axles of the revolving cylinder or drum, one of which arms is hollow, having two passages, the one communicating through the leg of the standard to the steam boiler, the other through the other leg to the condenser.

395. There are three valves in the hollow cylinder or drum, for the purpose of shutting off the steam and forming three distinct compartments; there are also three hollow arms, each leading from the hollow axle into one of these compartments. There is a heavy block of lead formed exactly to fit the curvature of the drum or hollow cylinder, which block or piston slides completely round the cylinder, the valves falling back into recesses as it passes by them. This block is so well fitted as to prevent the passage of steam between it and the cylinder.

396. The steam admitted through the hollow axle and through the hollow arm which leads to the lower compartment, where the block or piston lies, not being able to drive the block far from its place forces against the valve, which divides the chambers, and lifts that side of the revolving cylinder, carrying it round until the next valve has passed the block or piston, by which time the arm that supplied the steam has passed on so as to open a communication with the con-

denser or vacuum channel, by which the steam of the chamber becomes condensed. At the same time, the second valve having closed the communication with the next chamber, the steam through the hollow arm pours into that chamber, and exerts its expansive force against the block as before, and pressing upward against the valve raises the revolving cylinder. By these means the cylinder is kept in action, which action, by means of the extended axle of the cylinder, may be communicated as a first mover to other machinery.

397. The second description of engine has three cylinders or drums, one within the other; the outer drum is called a jacket or case, which is fixed. Between this and the second drum is a passage or flue which passes round the second drum in order to keep it heated, this second drum is also fixed. The third or inner drum only revolves upon its axles, poles, or arms, which pass through metallic stuffings. One of these axles is hollow for the passage of steam, and the other is intended to communicate the motion as a first mover of machinery. The steam enters the chamber from a boiler, and thence passes by curved channels into compartments formed by oblique partitions in the revolving cylinder or drum, and passes out through small apertures in the periphery of the revolving cylinder into the passage between that and the second drum, which is the condensing passage.

398. The lower part of the revolving drum, and also of the condensing passage, are charged with a quantity of mercury, or of water, or of fusible metal, such as lead or bismuth, &c., which is kept in a fluid state by the heat communicated to the inner cylinder through the flue which surrounds the second drum enclosed within the jackets. The steam passing through the entrance pipe, as before expressed, in one of the axles, occupies the central circular chamber, and thence flows into one of the compartments above described, formed by curved partitions, where the steam, acting against the fluid metal in the lower part, raises that side of the drum, causing it to revolve upon its axis; this brings the entrance to a second chamber from out of the fluid metal in which it was immersed (and which acted as a valve to the passage), when the steam, acting upon the fluid metal in this chamber, raises that side of the drum still more, that is, continues the revolution. By this time the exit passage of the chamber first mentioned is raised above the level of the fluid metal in the condensing or vacuum passage (which passage communicates with a condenser), by which the steam in the chamber is condensed; by this time a third chamber begins to fill with steam, the expansion of which, acting against the partitions upwards and the fluid metal below, raises the revolving cylinder still more, while the exit passage of the second mentioned chamber, rising above the level of the fluid metal, liberates and condenses the steam which it contained; the first mentioned chamber, having descended as the drum revolved, becomes immersed in and filled with the fluid metal which flowed in as soon as the vacuum was produced. Thus the continued revolution of the inner cylinder or drum is effected, and the

rotatory motion of the steam engine communicated by the extended arm or axle to the machinery for which it is designed to be a first mover. The advantages obtained by these arrangements, the patentee informs us, are in the absence of a fly wheel, by which much room and expense are saved, and also that of a heavy beam; and as the steam is always acting uniformly in this engine, which is not the case in a beam engine, where both steam and time are lost during the change of stroke, he conceives that the most economical and powerful appropriation of steam to the working of machinery may, by these improved engines, be effected.

399. Mr. Hague's patent steam engine must now be examined. The apparatus, which is called a rotatory engine, in appearance, very much resembles a chain pump, particularly that construction described in the specification of G. Tyer's patent, July, 1818; the parts are as follows: there is an endless chain, carrying buckets or pistons, which is distended over two cog-wheels, having recesses in their periphery for the buckets or pistons to fall into, and the cogs of the wheels take into the links of the chains for the purpose of carrying it round.

400. The cases of the apparatus consist of two boxes, placed one above, the other below, connected together by two pipes or cylinders standing vertically. One of the above-mentioned cog-wheels is placed in the upper box, the other in the lower, and the endless chain and buckets or pistons pass down the pipes or cylinders and over the wheels. The lower box is to be filled with a quantity of mercury, or other non-elastic fluid, up to the eduction or condensing pipe, which is at the bottom of the working cylinder, viz. one of the vertical cylinders or pipes before-mentioned.

401. The action of the engine will be seen by the following description: let steam of the low pressure be admitted at the upper part of the working cylinder from a boiler in the ordinary way, and it will entirely fill this case of the machinery, excepting that part of the working cylinder which is between the bucket or piston at that time in the upper part of the cylinder and the mercury below. The steam, by its expansive force, will then drive the bucket down the cylinder until it reaches the eduction or condensing pipe; before which time another bucket has entered the top of the working cylinder above. The columns of steam between the buckets then become condensed by the opening of the eduction passage; and a partial vacuum is produced, while the steam above presses down the second bucket or piston until a third has entered the working cylinder, and the steam, occupying the space between the second and third, becomes condensed as before, and so on; the buckets sinking through the mercury and up the other pipe, by which a continued rotatory action is obtained and communicated from the axle of the cog-wheel, and regulated by a fly-wheel. When this engine is worked by high pressure, the steam must be admitted at the lower part of the working cylinder, and the machinery will act the reverse way or upward. The steam's expansive force, resisted by the mercury below raises the

pistons or buckets, and is then condensed or discharged into the atmosphere at the top of the working cylinder.

402. Sir John Paul has a patent for a mode of generating steam. This invention is a mode of generating steam of high pressure, by passing water through a long contorted pipe enclosed within a furnace; by which contrivance a greatly extended surface is exposed to the action of heat, and steam of very high pressure produced with great rapidity. It is proposed to place a long metal pipe of small diameter round the furnace, and to force or inject water into one end of it, by means of a pump: which water is to be allowed to escape at the other end of the pipe, in the form of high pressure steam. The requisite length, capacity, and strength of the pipe, of which the boiler is to be formed, will depend upon the engine it is intended to work. For an engine of two-horse power the pipe should be 150 feet long, having its internal diameter at least three-sixteenths of an inch, and, if of copper, about one-sixteenth of an inch thick. This pipe is to be heated throughout its whole length nearly to redness, when the water injected at one end will escape at the other end in the state of steam, equal in pressure to about 150 lbs. upon the inch.

403. In constructing a boiler upon this principle, it is proposed to make a conical vessel of sheet iron, as an external casing, the broad end of the frustum downwards; round the inside of this vessel, the pipe above described is to be coiled, and supported upon flanges. A portion of the pipe, at the lower part of the vessel, is to be bent, so as to form the grate bars, upon which the fuel for heating the boiler is to be deposited, and the fuel may be introduced from the chimney at top, or otherwise, as may be found most convenient. A reservoir of water must be placed contiguous, and a forcing pump for injecting it into the pipe; and it is proposed to coat or cover the outer case with brick dust or coal ashes in order to prevent the radiation of heat.

404. The fuel being ignited, as in ordinary furnaces, the forcing pump is put in operation, which injects the water at the lower extremity of the pipe, so that as it rises through the conical worm, or contorted pipe, the water may become more and more heated, until it expands into steam, and this steam as it passes through the upper part of the coil, continuing to receive additional heat, ultimately escapes at the end of the pipe with great elastic force, in which state it proceeds to the engine.

405. For constructing the boiler of a steam carriage, where a chimney cannot be conveniently employed, another disposition of the worm pipe is proposed. In this boiler, the pipe is to be coiled in the form of two frustums of cones, of different dimensions, placed concentric; the larger or outer cone having its wider part at top, and the smaller, or inner one, its wider part at bottom. The continuous coil of pipe, thus formed into two cones, is to be fixed firmly upon suitable supports within the casing, which must be double, and the space between filled with coal ashes, or brick dust, or any other imperfect conductor of heat, as in the former instance.

The fire is made at the lower part in contact with the pipes, and the bottom of the casing is to be formed into a funnel shape, for the purpose of receiving the cinders and dust which fall from the fire, and conducting them to an ash pit below.

In this funnel an aperture is made, and a pipe inserted, which conducts a gentle current of air to the furnace, in order to keep up the fire, and consume the smoke; the current of air may be produced by bellows or by a wind hole, as may be found most desirable: and the fuel may be supplied from an air-tight box above, or by any other suitable means. The injecting pump is to be applied to one end of the pipe as before described, and the high pressure steam allowed to escape at the other end, for the purpose of working the engine. The carbonic acid, or other vapor, which is not destroyed by passing through the fire, is allowed to descend through the passage to the ash pit and to escape into the open air.

406. The specification concludes by saying that, for supplying engines of greater power than those above contemplated, more than one pipe boiler may be employed, and these may be heated either in the same way as above described, or in separate furnaces; they may be heated either by immediate contact with the ignited fuel, by the radiant heat from it, by the flame emitted, by the burning of gas, by heated air, or by any other fit and convenient means. The size, shape, or construction of the furnace, may also be varied considerably, according to circumstances, as may likewise be the arrangement of the coils of pipe, provided that the boiler consists of one entire or continuous pipe, or several pipes united together, so as to form one continuous passage from the end where the water is injected to that where the high pressure steam rushes out. The pipes may be made of any other suitable material besides copper, but their substance must be varied accordingly. The exterior surface of the pipe may be coated with a layer of fire clay, or any other fit material, to guard the pipe against the effects of the fire, and to prevent oxidation.

407. An apparatus for changing the water has been suggested by Messrs. Maudslay and Field, which is particularly adapted for the boilers of steam vessels, where salt water is used for the production of steam, as in the ordinary mode, the deposition of salt and other earthy matters, on the bottom and sides of the boilers, render them extremely liable to injury from the action of the fire. The second part of the invention is a mode of arresting the heat contained in the boiling water withdrawn from the boiler, and of conveying it into the water about to be introduced.

408. When sea water is employed in the boilers of steam engines, the evaporation quickly produces a supersaturation of salt in the remaining water, and this, rapidly increasing, causes a concentration of the salt, and a deposition of earthy matters on the internal surface of the boiler, which renders it necessary to change the water almost every fifty or sixty hours. It appears from the experiments of the patentees, that from twenty to thirty per cent. of the quantity evaporated taken out will keep the water within

a degree of saltness from which no practical evils can result, however long the boiling be continued.' The proposition, therefore, is to effect a continued changing and refreshing of the water in the boiler, by constantly drawing out a quantity of the supersaturated water or brine, and introducing other water to supply the place of that so withdrawn, as well as that which had been evaporated, by which means the water in the boiler can never exceed a certain degree of saturation, proportionate to the quantity so withdrawn.

409. The method proposed to effect this object is by the employment of meters, of any kind, that will regulate and adjust the quantity withdrawn to the quantity evaporated or driven off in the form of steam. No drawings are exhibited in the specification, it being considered that a general description of the method and kind of apparatus to be employed will be sufficient to enable any person to construct the necessary machinery. The meter recommended to be used is 'a small pump with a loaded discharge valve, worked by the engine, and so proportioned as to draw from the lowest part of the boiler the quantity determined upon.'

410. 'If, for instance, twenty-five per cent., or one quarter of the total evaporation, be the quantity withdrawn, it will be equal to one-fifth the quantity of common salt water driven into the boiler to keep up the supply. Thus, as sea water contains about 0.32 parts of salt, the water of the boiler will slowly but ultimately attain a degree of saltness equal to 5.32 or 4.32 parts more than sea water. After this every stroke of the engine will take as much salt out of the boiler by the pump as is left in the boiler by the steam used in the cylinder for that stroke.'

411. 'The engine working quick or slow, the quantity withdrawn bears the same proportion to the quantity left in; and, however long the engine may be worked, the water can never be more salt; thus avoiding the evils and inconveniences to which steam vessels have been hitherto subject on long voyages, in being obliged to stop to empty and refill the boilers every fifty or sixty hours, or incur the risk of severe injury to the boilers, from the deposition of salt within them, and a very great sacrifice of fuel the latter part of the fifty or sixty hours, when the water, from the quantity of salt it contains, is very unfit for raising steam.'

412. The second part of the invention is the means to be employed for arresting the heat contained in the rejected water, and returning that heat into the boilers. This is to be effected by running the hot brine into a vessel, and passing the supply water through a system of pipes or tubes of extended surfaces, immersed in the vessel containing the hot brine, and surrounded by it, in the same way as refrigerators are made to act upon worts. By these means the heat contained in the water or brine, expelled from the boiler, will be principally absorbed by the supply water, as it proceeds into the boiler, thus compensating in a great degree for the loss of heat which would otherwise be sustained, by removing a portion of the hot water, and introducing other which is cold.

413. Mr. Taylor's improvements have for their

object the prevention of unequal friction in the working of pistons that move in steam cylinders, either in horizontal or inclined positions. This object is proposed to be effected by passing the piston-rod through both ends of the cylinder, and by keeping the rod in a state of tension, by means of weights acting at each end of the rod.

414. In order to render this more evident, let it be supposed that the working cylinder of a steam engine is fixed in a horizontal position upon brick work, and that the rod of the piston is extended in a straight line, and passed through both ends of the cylinder, the apertures being properly packed, and the rods running upon anti-friction rollers in frames, for the purpose of keeping its action parallel; and that at the extremities of the piston-rod, bridles or sweep rods are attached, which are connected to double or right angled levers, these levers being for the purpose of giving the up and down motion to pump rods below the base of the engine.

415. It will now be perceived that in an engine so constructed, if the piston be made to reciprocate in the cylinder by the alternate expansion and exhaustion of the steam, that the long rod will move to and from, and work both the right angle double levers, raising the pump-rod at one end and depressing it at the other, and vice versa. It will also be seen that under these circumstances the piston-rod will be supported in all parts of its movement, and prevented from rubbing unequally; and this will be further aided, and the rod prevented from binding, by the tension produced by the weight of the levers and pump rods at the extremities.

416. In this way several cylinders may be connected together, and their powers made to act simultaneously upon one point, their rods being in the manner above described connected by bridles or sweep rods to the right angle levers below. This contrivance is applicable to engines that are worked either by expansive steam alone, or by exhaustion, or by the principles of expansion and exhaustion combined. The force of the engine, or combined engines, constructed as above, may be directed to one end of the piston-rod, by placing a weight upon one of the levers, equal to half the power of the engine and weight of the pump rod; this weight will be raised by half the power of the engine in one direction, and its gravity, added to the power of the engine in the other direction, will concentrate the total power on the rod.'

417. The patentee states his claim for novelty of invention to consist in 'the mode above described, of preventing the unequal friction of pistons working in cylinders either in a horizontal or inclined position, by passing the piston-rods through both ends of the cylinders, and by keeping such rods in a state of tension by means of weights or loads acting on each end of such piston-rod; and the modes, above described, of combining engines with cylinders placed in a horizontal or inclined position, so that they will work simultaneously, by which means the power of several such engines may be concentrated upon one point.'

418. Sir William Congreve obtained two patents for improvements in the rotatory engine.

The first of these consisted principally in the employment of bucket wheels, or endless chains with inverted buckets, against which the expansive force of the steam exerted itself, in an upward direction; and, by raising the buckets, in a manner exactly the reverse of their descent in a water-wheel, the motive force was given to the engine and other machinery.

419. The second specification states, 'I work all the various constructions of rotary steam engines, as well as those on the reciprocating principle embraced in my patent of 19th October, 1818, in a medium of fluid (or melted) metal, or alloy, in lieu of water.' By this substitution of fluid metal instead of water, an additional power is said to be obtained in engines of any given dimension, and that in proportion to the increased density of the medium so employed; hence the magnitude of an engine of any required power will be reduced, which will render it more compact, and less expensive in constructing.

420. It is further proposed to increase the power of any engine of given dimensions, by causing the temperature of the surrounding medium, of melted metal or alloy, to be kept at a higher temperature than that of boiling water; 'by which means the energy of the steam may be made equal to that of a high pressure engine, though the surface of the medium be open to the air: while, on the other hand, by working with the medium in a close vessel, and applying a condenser to exhaust the steam as it rises to the surface of the medium, a still further expansion of the steam, and consequent increase of power, may be obtained with a given temperature and given means, by thus removing the incumbent pressure of the atmosphere.'

421. 'The importance of these new principles will at once be understood by those who are versed in these matters, as they will perceive (taking one instance only, by way of example) that, by working the simple rotatory engine of my invention, formed by the immersion of a common hydraulic wheel (as described in the first case in the specification of my above-mentioned patent) in a medium, the specific gravity of which to water shall be as ten to one, a small wheel of two feet in diameter in such a medium will be impelled by steam of the same pressure as a wheel of twenty feet in diameter working in boiling water: and, consequently, that whereas, to obtain the same pressure as that of the steam of a common condensing engine, from steam working on this principle, in a medium of boiling water, would require a machine of very large dimensions, this same effect may be produced in a heavier medium by a machine of very moderate dimensions indeed.'

422. By working the steam in a medium of high temperature, the size of the boiler may be reduced, and a considerable saving of fuel effected; for the volume of steam from a small boiler will be very rapidly increased by these means to the extent of three or four-fold, without the medium being raised to any very high temperature; and a still more rapid evolution of steam would take place by raising the temperature of the metallic medium to such a height as

it is readily susceptible of; nor would there be found any difficulty in keeping the temperature of the fluid metal so raised to perform its operations.

423. 'Indeed, by carrying these principles to a greater extent, the necessity of a boiler may altogether be obviated; and the steam produced at once, by the injection of small quantities of boiling water, from time to time, into a small inverted receiver, in the heated medium; whence it would be carried to the proper part of the revolving wheel, or bucket, or other receiver in which it is to act, according to the particular construction of the engine: and in which inverted receiver the steam, from the rapidity of its generation, must be created at a much less expense of fuel than in any of the ordinary processes of the boiler; wherein, as the generation is comparatively so much slower, there is consequently so much more time even for the loss of heat by radiation. In fact, whether this heated medium operates by increasing the volume of steam ready formed in a separate boiler, or in the immediate generation of it without a separate boiler, the increased volume in one case, and the entire generation in the other, are effected in the very same moment that the steam produced is brought into action; and consequently without allowing any interval of time for the loss of heat.'

424. 'In the present state of this novel and rapid mode of producing and applying the force of steam, it is indeed impossible to say to what extent of power the effect may be carried, in proportion to the fuel consumed. It is evident, however, that so far from any possible condensation taking place in the steam, from the time of its generation to that of its action, the tendency of this mode of applying it is that of a continued accession of temperature.'

425. It is further stated that these modes of generating steam, or of increasing its volume when generated in a common boiler, is applicable to every description of steam engine. In the first case, the substitute of the boiler should be a moderately sized strong vessel, partly filled with the melted metal, into which small quantities of boiling water are to be injected at certain intervals of time; and, in the last case, the steam is merely passed through such a vessel, surrounded by the melted metal, in its way from the boiler to the engine.

426. In order to regulate the temperature of the fluid metal employed, the iron vessel in which it is heated should be surrounded by another iron vessel or jacket, filled, (when a very high temperature is desired), with oil or other such substance; by which arrangement the maximum temperature of the metallic medium will be limited to the boiling point of the surrounding fluid; and, in this case, an alloy of tin and lead, in equal parts, is proposed as a convenient medium for the above purposes; as it is not expensive, and becomes fluid at about 300° of Fahrenheit. When only a low temperature may be required, the medium should be formed by that alloy of lead and bismuth commonly called fusible metal, which becomes fluid at about 200° of Fahrenheit, the vessel in which it is contained

being immersed in boiling water. 'All the provisions of this patent apply also to the hydraulic wheel engines, whether the steam be made to enter into the buckets at their circumference, or through the hollow axis, and whether these buckets be open or closed ones.'

427. In Messrs. Boulton and Watt's bell-crank engine, the cylinder is supported by brackets proceeding from a cast-iron condensing cistern, and is placed over one end of it. The beam, which is formed like a right-angled triangle, has its centre of motion at the right angle, and the axis of it is supported by bearings screwed to the cistern; and, at the opposite end to that upon which the cylinder is placed, the horizontal arm of the triangle forms the working arm of the beam, to the extremity of which the power of the cylinder is applied. The connecting rod is jointed at the upper end of the perpendicular arm, and extends to the crank, which is supported in bearings screwed to the cistern at the same end at which the cylinder is placed, the centre of motion being at the same level with the top of the cistern; and, beneath the cylinder, the hypothenuse of the triangle of the beam forms a brace to strengthen it. Two of these beams are used, and are applied on opposite sides of the cistern, upon the same axis of motion, and are united together by cross rods, thus forming two connecting rods and cranks upon one axis of motion, the fly-wheel being placed at one extremity of the axis. To connect the piston-rod with the ends of the arms of the beam, or the base of the triangle, a rod is fixed across the top of the piston-rod; and, to the two ends of this, two other rods are linked, which descend to the beam, and are pointed to it at the ends. By this means the ascent and descent of the piston-rod produce a corresponding action of the beam upon its centre of motion; the upper end of the perpendicular arm moving backwards and forwards, thus by means of the connecting rods turning the cranks. The rods which descend from the bar, which is fixed across the top of the piston-rod to the ends of the beams, are so constructed as to preclude the necessity of employing the parallel motion. This engine is very compact; it requires no fixing, and the air-pump, which is placed in the middle of the cistern, is worked by two rods jointed to the horizontal arms of the beams.

428. Mr. Woolf's double cylinder-engine nearly resembles that by Mr. Hornblower, but in another apparatus, by the same ingenious individual, he proposes to apply fire to the cylinder itself, to heat the steam after it is thrown into the working cylinder; and this was to be done by a fire being placed beneath the case containing the cylinder: the space between the case and the cylinder was to be filled with oil, wax, fusible metal, or mercury. He also proposes a method of preventing the passage of any of the steam from that side of the piston which is acted upon by the steam, to the other side, which is open to the condenser. In those steam engines which act as double engines, he effects this by employing upon, or about the piston, a column of mercury, of an altitude equal to the pressure of the steam. The efficacy of this arrangement

will, he says, appear obvious, from attending to what takes place in the working of such a piston. When the piston is ascending, that is, when the steam is admitted below it, the space on its upper side being open to the condenser, the steam, endeavouring to pass up by the side of the piston, is met, and effectually prevented by the column of metal, equal or superior to it in pressure; and during the down stroke no steam can possibly pass without first forcing all the metal through.

429. In working what is called a single engine, a less considerable altitude of metal is required, because the steam always acts on the upper side of the piston; and, in this case, oil or wax will answer the purpose. But care must be taken, either in the double or single engine, when working with this piston, that the outlet which conveys the steam to the condenser shall be so situated, and of such a size, that the steam may pass freely, without forcing before it, or carrying with it, any of the metal or other substance employed, that may have passed by the piston: and at the same time providing another exit for the metal, or other substance collected at the bottom of the cylinder, to convey the same into a reservoir kept at a proper heat, whence it is to be returned to the upper side of the piston by a small pump, worked by the engine, or by some other contrivance. In order that the fluid metal used with the piston may not be oxidated, some oil or other fluid substance is always to be kept on its surface, to prevent its coming in contact with the steam: and to prevent the necessity of employing a large quantity of fluid metal, although the piston must be as thick as the depth of the column required, the diameter need be only a little less than the steam-vessel, or working cylinder, so that, in fact, the column of fluid metal forms only a thin body round the piston.

430. Having described the nature of Mr. Woolf's engine, it may now be advisable to examine the boiler by which he proposed to generate steam of sufficient elasticity for the use of the small cylinder, which requires vapor of great expansive force.

431. The boiler represented by the diagram beneath consists of a series of tubes of cast iron,

a, a, a, connected by screw bolts with the under side of a larger vessel *A*, or magazine of the same material. This is furnished with four, and in some cases with five apertures; the first of which is intended for the admission of water to supply the waste which continually arises from evaporation, which is effected by means of a

small forcing-pump, as it will be evident that the column must be carried to a considerable height before its weight can so far overcome the resistance of the steam within the tube to allow of its entering by the ordinary method.

432. The plan of the boiler will better be understood by a section of the tubes represented from 1 to 8. This is furnished in the engraving beneath, and the direction of the smoke proceeding from the grate B to the flue O is shown by the bent arrows.

433. Passing from the boiler we arrive at the steam pipes, which should be sufficiently capacious, and as short as possible, to prevent too much exposure of surface to the atmosphere. They should pass from the upper part of the boiler to the steam cylinder, in a direction greatly inclining upwards, so that any condensed water that forms in them may run back to the boiler instead of getting into the cylinder: consequently every boiler should, if possible, be set or fixed lower than its steam cylinder; and, in order the more effectually to prevent condensation, the steam pipes should be coated with hay-bands, or sawdust and sacking, or some bad conductor of heat, particularly if they are long and much exposed to the air.

434. In collieries, where the common steam-engine is applied for drawing water from the mines, it frequently happens that, after a continuance of wet weather, the water accumulates so much as to require the engine to be worked night and day. If the boiler is supplied with water from the mines, it contains in this case a great quantity of earthy matter brought immediately from the surface, which renders the water within the boiler very muddy; and there being little time for cleaning the boiler, owing to the accumulated water in the mines, six or eight weeks elapse before this can be done. Towards the end of this period the water in the boiler is mixed with sediment to such a degree that the ordinary supply of steam cannot be raised, although the fire is increased in the furnace; the consequence of which is that the common working speed of the engine is greatly reduced. In this case it has been the constant practice of the engine-keepers in Scotland to apply a very simple remedy for increasing the quantity of steam. The substance employed is known by the name of comings, being the radicles of barley produced in the process of malting, which are separated before the malt is sent to market. About a bushel of these is thrown into the boiler; and, when the steam is again raised, an immediate effect is visible; for there is not only

a plentiful supply of steam to produce the full working speed of the engine, but an excess of it going waste at the safety-valve.

435. Mr. William Deverell has two working cylinders placed near to one another, each having a pipe of communication, with a large vessel, in which the steam, after passing from the small cylinder, is suffered to expand itself before entering the large cylinder. The pistons in the two cylinders work alternately up and down by means of valves or cocks, opening and shutting as in the common engine. Suppose the small piston has just made a stroke, and a passage is opened to the steam vessel at the end of the stroke; at first beginning to work the engine, the vessel will be full of steam of about eighteen pounds pressure, admitted from the boiler, but afterwards will only be supplied by the steam thrown into it from the small cylinder. The vessel should be about twenty times larger in capacity than the smallest working cylinder; and the larger it is the more regular will be the pressure on the great piston, which is worked by the steam coming from the steam vessel. If the steam in the boiler be of fifty-four pounds pressure per square inch, the ratio of the two working cylinders may be as 1 to 3; for then the smaller one will supply the larger with steam of about eighteen pounds pressure; the proportion, however, may be varied, though these are thought best by the patentee. The improvements here are represented to consist in the steam going from the smaller working cylinder to the steam-vessel, and then from the steam-vessel to the larger working cylinder, from which it is afterwards drawn off and condensed. By these means, the engine will be very regular in its operations. Suppose the steam in the boiler is at fifty-four pounds, the small cylinder will, at the end of the stroke, be full of steam of the same or nearly the same force; and the steam-vessel being full of the steam delivered to it by the former stroke of the small cylinder, at about eighteen pounds pressure, the communication is opened between this vessel and the smaller cylinder, and the steam in each of these will be brought to nearly twenty pounds pressure, which steam will be used in the great cylinder at the next stroke. But at the end of each stroke of the pistons, before the opening is made between the smaller cylinder and the steam-vessel, the steam in the smaller cylinder will be, as before stated, at about fifty-four pounds; in the steam-vessel it will be at about eighteen pounds, and in the larger working cylinder at about eighteen pounds also. Hence the medium pressure on the piston of the smaller cylinder will be about thirty-five pounds on the inch, while the medium pressure of the steam on the piston of the great cylinder will be about nineteen pounds on the inch; for it will be about twenty pounds at the beginning and about eighteen pounds at the end of the stroke. If the steam-vessel be made larger, the difference at each end of the stroke will not be so great. If the steam was let out at fifty-four pounds from the smaller cylinder to the open air, there would be but thirty-nine pounds upon each inch of the piston in consequence of the re-action of the atmosphere, equivalent to about fifteen pounds per inch:

STEAM ENGINE.

WATT'S DOUBLE ENGINE.

thus, by letting the steam pass from the smaller cylinder to the steam-vessel, instead of letting it out to the open air, it loses about four pounds on the inch of the small piston, but it gains about twelve pounds on the inch of a piston three times as large; and, there being but half the steam required in the common way to condense, there must of necessity be a considerable gain. If the friction and loss of force be equal to nine pounds on the inch, on the piston of the smaller cylinder, there will be but about thirty pounds on the inch neat power, when the larger one will work about twelve pounds on the inch. Here, too, if the large cylinder, or piston, or air-pump, or condenser, should be out of order, the small piston may still be worked, by disengaging the large piston from the beam; on the other hand, if the smaller piston be out of order, the large one may still be worked, while the other is disengaged. The steam-vessel is to be made of wood, that it may transmit the heat slowly, and the cylinders may be placed within it if found convenient.

436. Mr. James has taken out a patent for a boiler, which, with some modifications, promises to be of great importance. It is formed by a number of annular tubes, arranged close together sideways, so as to exhibit a cylindrical shape externally; these tubes have apertures communicating into each other at opposite extremities of their diameters, arranged in two lines, one of which is at the bottom, when the boiler is fixed horizontally in its place, and the other line at its upper part. It is stated, at the end of the specification, that the shape of these rings may be elliptical or circular, and that round or other shaped tubes may be used for them, if preferred to those represented in the drawings, which are square, and such as might be produced by annular partitions soldered in between two hollow concentric cylindrical vessels.

437. The fire-place or furnace for this boiler is placed within it, and consists principally of a grate, arched upwards in the middle, supported by a bearing bar at each side, which passes through the boiler, and is sustained by the iron frames which support the doors of the furnace, and are put in front and the termination of the fire-place.

438. This compound boiler is moreover enclosed by a double cylindrical case, so as to leave some space between it and the case, in which the flame or hot vapors from the fire may circulate; while the internal part of this double case, being filled with charcoal dust, confines the heat more effectually. A flue rises from the top of the farther end of the case to convey away the smoke, which, however, is made to descend near the bottom of the boiler before it enters the case, by a partition at the farther extremity of this latter, whose only aperture is at its bottom.

439. A tube enters into the boiler in front, a little above its horizontal diameter, for the conveyance of water, and a pipe passes out from it at top, also in front, through which the steam is to pass to the engine; the water pipe is furnished with a peculiar cock at the level mentioned, which revolves by the motion of the engine, and is intended to prevent the water from rising

any higher in the boiler, when it ascends to that line, though it admits its entrance whenever this is lower; but the mode in which the cock is to produce this effect is not fully explained.

440. The boiler being thus prepared is to be filled with water a little above its horizontal diameter, as above mentioned; and, the fire being then kindled, the patentee states that the flame or hot vapor from it will descend between the case and the boiler, and make the water in the latter boil; the steam from which, in passing through the upper parts of the tubes above the fire, will be farther heated, so as to produce an increased effect.

441. To facilitate the cleansing of this boiler from the sediment of the water, it is to be supported in front by four rollers, placed at equal intervals about it, in the iron frame which sustains the case and furnace, and at the back by a pivot in the centre of the partition at its end, which pivot passes through the case, and rests on the frame just mentioned; a winch is to be fixed on this pivot, and a handle at the same time is to be attached to the boiler in front, at a similar distance from its centre, by which two grips it can be turned round, or made to vibrate backwards and forwards when required. When this operation is to be performed, the patentee directs that the furnace is to be taken out from the boiler, and all impediments to its circular motion to be removed; it is then to be nearly filled with water, and, shot or 'marbles' being previously put into each of its annular tubes, the whole is to be turned or made to vibrate as mentioned, which he states will be sufficient to detach the sediment from the parts to which it may adhere, and cause the whole to run off along with the water when this is discharged.

442. The gas-fire or water-burner is the name given to a new method of producing light and heat, invented by Mr. Morey, by which he conceives that all carbonaceous fluids may be conveniently burnt, and derive great force from their combination with the oxygen and hydrogen or water or steam at the moment of ignition. In the first form of this experiment a tight cylindrical vessel, containing resin, was connected with a small boiler by a pipe, which entered near the bottom and extended nearly its length, having small apertures over which were two inverted gutters, inclining or sloping upwards over each other; the upper one, which was longer than the other, being intended to detain the steam in the resin in its way to the surface. When the resin was heated, carburetted hydrogen gas issued from the outlet or pipe, inserted near the top of the vessel, and, being ignited, afforded a small blaze about as large as that of a candle; but, when the steam was allowed to flow, this blaze instantly shot out many hundred times its former bulk, to the distance of two or three feet. Tar succeeds better than resin, and has therefore been used in the steam-boilers.

443. We have, on several occasions, been obliged to refer to the 'horse-power' as it is called, of various engines, and it will be necessary in a future page to examine this mode of estimating force somewhat more in detail; at present a few facts connected with the single and double acting engine may not be misplaced.

Nominal horse-power		Dimensions of the piston.			Effective pressure or load on the piston.		Velocity of the motion with which the load is raised.					Mechanical effect expressed by the weight which can be raised in a minute to a height of one foot.		Consumption of coals in an hour in pounds weight.		
Double engine.	Single engine.	Diameter in inches.	Area in square inches.	Number of square inches for each horse-power.	Pressure on each square inch in pounds.	Load on the piston in pounds.	Length of stroke in feet.	Number of strokes per minute.	Velocity of the piston per minute in feet.		Cubic feet of water.	Pounds avoirdupois.	Double engines.			
									Double engine.	Single engine.			By each horse-power.	T. gal.	Single engines

444. A table may now be referred to, which shows the force which the connecting-rod of a steam engine has to turn round the crank at different parts of the motion. The parts of the engine are supposed to have the following proportions:—length of the stroke 1; length of the beam, 2; length of the crank 5; length of the connecting-rod 3:—

Decimal portions of the descent of the piston, the whole descent being 1.	Angle between the connecting-rod and crank.	Effective length of the lever, upon which the connecting-rod acts, the whole crank being 1.	Decimal portion, half a revolution of the fly-wheel.

The third column of this table also shows the force which is communicated to the fly-wheel, expressed in decimals, the force of the piston being 1.

445. The above table explains itself by the titles of its different columns; and it is only necessary to remark that the variations of force are not to be considered as an absolute loss of power, because, when the crank has but slight power, or arriving towards the top or bottom of the stroke, the piston descends proportionally slow; and in consequence the steam has more time to flow into the cylinder, and press upon the piston with a greater power; therefore, what the piston loses in force upon the crank, it makes up in some degree by an increase of its force; and, from moving slower, it consumes less steam than when moving with its whole velocity, and acting with full force upon the crank. Hence both the power and the velocity of the piston in the cylinder are to be considered as varying continually; and, if the fly is sufficiently heavy, it will be found that the rotative motion is very nearly regular, while the ascent and descent of the piston are accelerated from nothing at the top of the cylinder, to its greatest velocity at the middle, or near the middle, and from that point it is retarded, till it comes to nothing at the bottom

of the motion. The table shows the exact increments and decrements.

446. Mr. Taylor has made considerable improvements in the steam engine. His last patent consists of an arrangement of the piston rods of cylinders of steam engines, when in an horizontal or inclined position, to prevent the pistons from pressing unequally on the cylinders, and a method of combining two or more cylinders so as to direct their joint powers to one operation.

447. The patentee directs, for attaining the first object, that the piston rod shall pass through the piston, and out through the opposite end of the horizontal or inclined cylinder, being provided with fit stuffing boxes at both of its extremities, and that each end of this long piston rod shall be furnished with a vertical wheel, grooved at its rim, and moving between two metal guides, parallel to each other, and to the sides of the cylinder. These guides, being of course one above and the other below the wheels, would prevent the weight of the piston from making it press too much at the lower side of the cylinder, if the rod were perfectly inflexible; but, as this cannot be, the patentee supposes that he will effect his purpose by causing considerable weights to act on each end of the rod in opposite directions, by appending them to the horizontal arms of 'bell cranks,' or bent levers, so as to tend to keep the rods straight by their being in a state of tension. These weights may either consist of pump rods at each extremity when the engine is employed in pumping the water from deep mines, or a pump rod may be at one extremity and the weight at the other, in which latter case the power of the engine exerted in lifting the weight would not be lost, as the weight would react on the piston rod in its descent, and assist the engine in lifting the pump rod and water at its opposite extremity.

448. It is obvious that these engines may be employed in producing rotary movements for mill work, as well as those of a reciprocating nature mentioned; but with the rotary movement the tension of the piston rod would not be effected, without weights being appended for this purpose to the bent levers at each of its extremities.

449. The action of two cylinders managed in this manner may be combined by placing them parallel to each other, and uniting their piston rods at each end to strong cross pieces, from the middle of which rods are to proceed to the bent levers, weighted as before. In the specification two cylinders are represented, lying on the same horizontal plane, and having the wheels and guides at each end of the cross pieces, instead of being in the same line with the piston rod; but it is evident they may be placed one over the other also on the same principle, and that any number of them may be combined in this manner by properly disposing the cross pieces and wheels, which latter, however, need not be multiplied as the number of cylinders are increased, as the same number of wheels that will serve for the piston rods of two cylinders may also be made to support those of several more.

450. A method of binding these cylinders down firmly to their supports, whether the latter

are constructed of stone or of cast-iron, is described by the patentee; as is also the mode of disposing the tubes that convey the steam to the several cylinders, and from them to the condenser, or to the open air (according to the nature of the engines), so as to make one set of valves or slides serve for them all. But as there is nothing particular in the arrangement of these tubes, or in the method of fastening down the cylinders, being such as may be easily conceived, they do not require further explanation.

451. The steam carriages described in Mr. James's specification are intended solely for common roads. Instead of the former method, of using one steam cylinder, or at most two, for each steam-carriage, the patentee directs that a steam cylinder shall be used for each wheel, and in his draft, in fact, two cylinders are represented at each extremity of the two axles, so that eight steam cylinders will be required altogether for this plan.

452. These cylinders the patentee states are to be very small, but does not mention their precise dimensions; and, as the pistons of each pair of them are arranged to operate so on the cranks with which they are connected, that when one is vertical the other will be at right angles to it, to save the use of fly wheels, every pair may be considered as one engine acting on the wheel which it is intended to move. These cylinders are placed beneath the axles of the carriage, and the cranks are fixed above them, and each of these cranks is furnished with a spur wheel, which, by another wheel of the same sort, acts on a toothed ring, attached to the nave of the carriage wheel, which nave turns freely on its axle. From these cylinders, pipes run to the steam boiler, on which cocks are so placed that, by turning them in certain directions, the steam may be let on or shut off from each pair of cylinders as required, and also may be admitted partially sometimes; by which means each wheel can have its degree of velocity regulated in respect to that of the others, as may be best suited for making the carriage turn round a corner, or move in any curve desired.

453. The steam boiler is placed beneath the perch, near the hind wheels, and the chimney still further back, together with the seat of the engine-man, who not only keeps up the fire, but, by handles placed near him, which communicate with the cocks before mentioned, can stop either of the hind wheels or diminish their motion, as may be most suitable to the slope of the hills, in descending which locking of the wheels might be necessary. The engines used with these carriages are to be of the high pressure species, so that the steam might be discharged from the cylinders at once after being used; but to obviate the inconveniences which this would cause, pipes pass from them to the chimney, to carry off the waste steam along with the smoke.

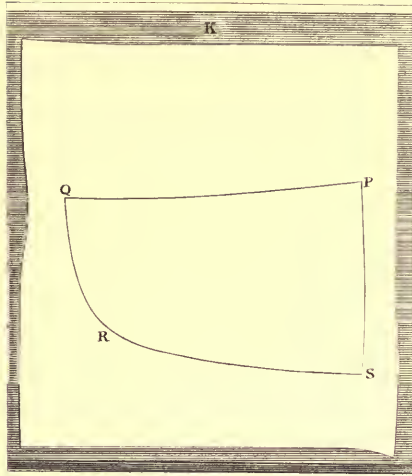

454. The front axletree is made to turn on its centre as usual, and the steam pipes on it have joints at the centre of motion, similar to those of cocks, to admit of their being turned along with it; a segment of a horizontal toothed wheel

is attached to this axle, in which a pinion works, from which a vertical shaft ascends to the seat of the director, which is placed directly above it, and is constructed like a coach-box. On the top of this shaft a horizontal wheel, furnished with handles like the steering wheel of a ship, is fixed, by which the director can turn the front axletree as the curvature of the road may require. Horizontal rods are also so arranged, between this axle and the cocks, that in proportion as it is turned the steam may be shut off from the cylinders at the side next the centre or centres of the curvature of the road, by which means the wheels at that side move more slowly than the others. Besides the steering wheel, there are two levers with handles, placed near the seat of the conductor, which communicate by cranks with the rods just mentioned, by which the cocks are turned, and by moving which he can either diminish the motion of the wheels at one side, as he pleases, or stop off the steam from all the cylinders at once, when it is required to stop the progress of the carriage.

455. Mr. Vaughan's steam engine is of a very peculiar kind. An idea of its arrangement may be formed by supposing the cylinder of a single steam engine to be placed with its bottom upwards, and another similar cylinder to be fixed in the usual position directly upon it, so that the piston rods of both may be in the same vertical line. Each of these cylinders has its separate piston, and the two piston rods are connected together by two bars, which pass outside the cylinders, from the ends of a cross-piece on the extremity of one of the piston rods, to the ends of a similar cross-piece on the extremity of the other piston rod; the two pistons being previously so placed that one of them shall be near the open end of its cylinder, when the other is near the closed end of that in which it moves. A case is directed to be put over the two cylinders, to confine the heat, and the openings between this case and them at each end are to be closed, so as to exclude the air. A pipe, furnished with a cock, is to pass from the steam-pipe, near where it enters the valve box, to the inside of this case, to convey steam into the space between it and the cylinders when the cock is opened, to keep the cylinders hot; and from the lowest part of the case another pipe passes out, furnished also with a cock, to let off the water formed within the case by the condensation of the steam. The bars which connect the two piston rods pass through tubes of copper or other metal, placed vertically between the case and the cylinders, and fastened at each extremity to the ends of the case so as to be airtight.

456. The valve box is fixed at the junction of the two cylinders, and in it a sliding valve is used, having a cavity within it, which, as it is moved up and down, alternately forms a communication between the passages that lead to the two cylinders and those which go to the steam-pipe and to the condenser, the rod which works this valve passing through a stuffing box at the top of the valve box. The beam of the engine is to be connected with the piston rods by the links of the parallel gear being joined to

STEAM ENGINE. *Steam Engine Indicator.*

O

over rails of the frame E E. L a small brass socket, which may be fixed at any height upon the piston-rod, by the tightening screw M. It carries in the other end a short pencil, with a weak spring to push it forward against the surface of the sliding-board. N a weight attached by a cord to the sliding-board K. O any convenient part of the parallel motion, traversing a space of about four inches and a half during each half stroke of the engine.

462. From this description the principle on which the instrument acts will be evident. By opening the stop-cock B a direct communication is made between the interior of the large and small cylinders, and the density of the steam in the indicator becomes the same as in the steam engine cylinder above the piston. When this density is less than that under the atmospheric pressure, the indicator piston will sink, when it is greater the piston will rise; but the spiral spring, which, if carefully made, stretches through equal distances with equal weights, restrains the motion of the piston; and, by the distance to which it allows it to move from its state of rest, indicates the pressure it is undergoing. During each stroke of the engine, therefore, the indicator piston will rise at the instant the upper steam valve opens, and during the descent of the large piston will maintain a height proportioned to the density of the steam in the cylinder. When the eduction valve opens it will sink, and by the rapidity of its descent, and the distance to which it falls, denote the quality of the vacuum. If, during this perpendicularly alternating motion of the small piston, the sliding-board be made to perform its reciprocating and horizontal course, the pencil, in the socket L, will trace upon the board, or upon a piece of paper applied to its surface, a figure, something like P Q R S; of which figure, the part P Q is drawn during the descent of the large piston. At Q, the condensation taking place, the atmospheric pressure acts upon the piston indicator, and makes it descend until the tension of the spring counteracts the force of the pressure. Meanwhile the engine begins to perform the up-stroke, and, as the board traverses, produces the line R S. When the engine piston arrives at the top, the admission of the steam destroys the vacuum that existed below the indicator piston, and allows the spring to raise the latter until the equilibrium is restored. It consequently follows that the distance between the line P Q, and the line R S, will be greater in proportion to the difference between the pressure in the cylinder during the existence of the va-

cuum and the pressure of the steam, and the curve Q R be more acute in proportion to the rapidity with which the vacuum is formed. If this distance be measured in eight or ten places, and an average taken, then a simple proportion gives the pressure upon each square inch of the piston. Let a = area of indicator piston, b , any weight applied experimentally to that piston, d , the distance to which it falls with that weight, and let e be the average distance taken from a diagram, and f the average pressure in pounds upon the steam engine piston during the formation of that diagram. Then, as d to $\frac{b}{a}$ so

is e to f , or $\frac{b e}{d a} = f$. And as, for every individual instrument, $a b d$ are constant quantities, then $\frac{b}{d a} = x$, a constant number by which to multiply the average distance obtained from a diagram, for the average pressure in pounds upon each square inch of the steam piston.

463. A table of the amount of work really effected by the principal engines in Cornwall in one month may here be furnished. The whole number of engines reported in the month was, fifty-three pumping engines, fourteen whim engines, three stamping engines. Of the pumping engines fifty are single and three double power, and three of the single power engines have combined cylinders; the diameters of the cylinders as under:—

Engines.	Inch.	Bushels.

466. It may be remarked that the time of the year is the most unfavorable to the work of the engines; as, from the abundance of water in the mines, many are pushed beyond their most advantageous rate.

467. Duty of the best whim engines, rotatory, double, 6,000,000 drawn one foot high, by each bushel of coals, or thirty kibbles, drawn from the depth of 100 fathoms by ditto. Duty of the best stamping engines, rotatory, double, 15,000,000 lifted one foot high, by each bushel of coals.

468. The monthly report of the duty of steam engines in Cornwall is taken and computed by Messrs. John and Thomas Lean, who are specially appointed and paid for that purpose by the adventurers in the mines, whose object is to obtain a correct comparative statement, by which they may ascertain the merits of the respective engines, and may judge of the skill and care of the engineers they employ.

469. Messrs. Leans have the custody of the keys of the counters on the engines, they themselves measure the capacity and lengths of the pumps, and they receive the returns of the quantity of coals consumed from the persons who measure it, and make oath of the consumption at the custom-houses for the debenture which is allowed.

470. The engineers whose names are given are not manufacturers of engines, nor are they allowed to participate in any business of that kind; they plan the construction and superintend the execution and erection of engines, for which they are paid according to the power of each; and they have the care of them after being erected, and direct repairs, &c., for which they receive regular salaries from the mines.

471. The Royal Academy of Paris has been called upon by the government, to report on the means proper to be adopted for the prevention of accidents and injury from the explosion of steam engine boilers. The means proposed had the double object of preventing the rupture of the boilers, or, in case of their destruction, preventing injury to neighbouring buildings. They directed that the boiler should be proved by the hydraulic press, with a force five times that which they would have to bear during the working of the engines: that a safety valve should be attached to the boiler and locked up, the valve being so loaded as to open at a pressure just above that by which the boilers have been tried: that the boiler should be surrounded by a wall of masonry one metre (39·371 inches) in thickness; an interval of a metre being left between the boiler and the wall, and again between the wall and the neighbouring buildings. Another precaution has been added by M. Dupin, and adopted by the academy; namely, the introduction of a metallic plug into the upper surface of the boilers, formed of such an alloy as should melt at a temperature a few degrees above that at which the engine is intended to work.

472. In consequence of this application, it became necessary to form a table of the pressure and temperature of vapor. The academy appear very doubtful of the estimates as yet pub-

lished, but give the following table up to eight atmospheres, as nearly correct: above that they say it was impossible to go without farther experiments.

Elasticity in atmospheres.	Height of mercury.	Temperature of Fahrenheit.	Pressure on a square inch.
1	29·22	212·0°	14·61 lbs. avoird.
1½	44·88	234·0	21·92
2	59·84	251·6	29·23
2½	74·80	264·2	36·44
3	89·76	275·0	43·84
3½	94·73	285·3	51·15
4	119·69	293·4	58·46
4½	134·65	302·0	65·76
5	149·61	309·2	73·07
5½	164·57	316·4	80·37
6	179·53	322·7	87·69
6½	194·49	328·5	94·99
7	209·45	334·4	102·30
7½	224·41	339·3	109·60
8	239·37	343·4	116·92

It is advised that no direction should be given for the composition of the fusible plugs or plates, but their preparation entrusted to some competent person who should be responsible for the accuracy of their fusing points. The fittest place for them, all things being considered, is the upper surface of the boiler. Their proper diameter and thickness have not yet been ascertained; they should be such as to bear the force of the vapor without risk of breaking; and, when the plate is fused, to leave an aperture sufficient for the ready escape of the vapor.

473. Mr. Prideaux has furnished a series of ingenious arguments, illustrative of the use of high pressure steam, that may be here quoted. He states,

i. That the caloric of steam, in contact with water, is a constant quantity at all temperatures.

ii. That every elastic fluid, at a given density, has its expansive force in proportion to its temperature, increasing $\frac{1}{273}$ for each ascending degree of Fahrenheit.

iii. That every elastic fluid, at a given temperature, has its expansive force directly as its density.

474. From these premises it follows that the force of steam is directly as its density multiplied by $\frac{481}{273}$ for each degree of increased temperature, the caloric corresponding with the density alone. For instance: steam at 212° has an elastic force = 30 inches of mercury; and at 300° = nearly 140 inches, neglecting fractions.

475. By the second law, steam of the density due to 212° raised 88° with a geometrical increase of $\frac{481}{273}$ for each degree, shall gain about 5·6 inches; or possess at 300° a force = 35·6 inches of mercury.

476. And by the third the density due to 300° shall be as 35·6 inches to the force found = 140 inches, or about 3·9 times greater than at 212°. But the caloric being constant is in simple proportion to this density; and the fuel consumed must be expected to correspond with the caloric. Then 30 inches \times 39 = 117 inches, the force due to the density at 300°, deducted from 140

inches, the force found by experiment, gives 23 inches, the profit by working at 300°.

477. If this example be just, the weight of steam employed having its caloric constant, shall be a measure of the fuel consumed; and there is a direct profit in the ratio of $\frac{4}{100}$ for each ascending degree of Fahrenheit, as above stated.

478. It is plain, from the nature of geometrical progression, that this profit will increase as the temperature is more elevated: if we work at 600° the force of each pound of steam will be double of that at 212°; and if we go up to 960° or 980°, it will be quadruple; the caloric, and consequently the fuel, remaining a constant quantity. It is easy to illustrate this from the reports of working engines; but the effects in these cases are dependent on such mixed causes that no uniform conclusion can be drawn from them. In taking the caloric contained in the steam as a measure of the fuel consumed, there is not exact precision: radiation will of course increase with temperature; but I thought this might probably be more than compensated by the diminished surface of the vessels; and that, in the rapid action of a steam engine, it could hardly make an appreciable difference.

479. A collateral advantage of not less importance, well known to engineers, and which did not escape the sagacity of Mr. Watt, is gained in allowing high pressure steam to expand in the cylinder. Mr. Watt has given a formula for calculating the profit on this proceeding; but for a much more perspicuous demonstration we are indebted to Mr. Perkins.

480. Suppose we have to work at a pressure of ten pounds on the inch. Let the steam be raised to a force of eighty pounds on the inch, and let in one-eighth of the stroke; then stop the communication, the piston being at I. We have thus one-eighth at eighty pounds. When the steam has expanded to II the volume is doubled, and the force reduced to forty pounds (supposing the cylinder to keep the temperature constant), the mean from I to II being sixty pounds. Hence we have one-eighth at sixty pounds. When the piston reaches IV the volume is again doubled, and the force reduced to twenty pounds, the mean from II to IV being thirty pounds. This gives one-fourth stroke at thirty pounds. On reaching VIII the volume will again double itself, and the force will be reduced to one-half; thus becoming ten pounds on the inch as proposed; but the mean, from IV to the bottom, is fifteen pounds. Which makes half a stroke at fifteen pounds. Adding these quantities together, we have

- I. $\frac{1}{8}$ at 80 lbs. = 10lbs.
- I to II. $\frac{1}{8}$ at 60 lbs. = 7.5
- II to IV. $\frac{1}{8}$ at 30 lbs. = 7.5
- IV to VIII. $\frac{1}{8}$ at 15 lbs. = 7.5

32.5 lbs. on the inch.

for the mean impetus communicated to the

fly-wheel by each stroke of the piston: and, as the cylinder full of steam is at a density of only ten pounds on the inch, the power thus gained appears at first view enormous. But against this must be set the irregularity of the impulse communicated to the fly, and of the temperature supplied to the cylinder; beside the additional weight and friction of the machinery, and other considerations, involving too many theoretical principles to allow of a satisfactory estimate from calculation without direct and repeated experiment.

481. The comparative advantages of high and low pressure steam have however been most fully discussed by a Committee of the French Institute, and an analysis of their labors is well worth perusal.

482. Amongst the advantages of high pressure engines, that of occupying the least possible space must be enumerated, and will be the more important as the space for their erection is more confined, or the ground more valuable: where manufactories, and private houses, are so crowded together that each establishment can obtain but a very limited space, and great power is at the same time necessary, this advantage is particularly felt; and it is no less important in the interior of mines, for the same reason.

483. A second advantage of high pressure engines, and one that is even greater than the former, is the economy of fuel which results from the effects of a high temperature. This will be readily granted, when it is stated that the repairs and expenses of the steam engines employed in draining a single large coal-mine in England amount annually to the sum of £25,500.

484. On this account several large proprietors of copper and tin mines, in Cornwall, adapted machinery to their engines, in 1811, by which an account is regularly kept of the work which they perform; and, from the results of these experiments, conducted on the largest scale, the comparative effect of the different kinds of engines has been ascertained for more than ten years.

485. In the month of August, 1818, the Cornish steam engines raised 15,760,000 lbs. one foot high, for each bushel of coals consumed. From December, of the same year, the improvements were so material, either in the management of the engines, or in some of their parts, that the mean total product was increased to 17,075,000 lbs.

486. By a series of similar improvements, and by the construction of new and more perfect engines, the product was,

In December, 1812,	18,200,000 lbs.
_____ 1814,	19,784,000
_____ 1815,	20,766,000

and, since 1815, the product is even still larger, in consequence of the improvements that have been made in the construction of the fire places and boilers, and, in short, in every part of the machinery. At the present day, it is calculated that Watt's improved steam engines raise more than 30,000,000 lbs. of water one foot high, by the consumption of one bushel of coals.

487. By the side of this augmentation we

must place that which results from the employment of Woolf's steam engines, which, as is well known, are condensing engines, and work with a pressure intermediate between that of the high and the low pressure engines.

488. Such a machine, with a double cylinder, has been constructed for the mine Whealvor, in Cornwall; the diameter of the large cylinder is fifty-three inches, and that of the small one 5-3 inches. This engine has raised 49,980,822 lbs. one foot high, by one bushel of coals, whilst the mean product of the other engines was only 20,479,350 lbs. raised to the same height. In 1815 the mean product of two of Woolf's engines was 46,255,250 lbs.

489. One of the inconveniences attending engines of mean and high pressure, is loss of power by the wear of the more delicate parts of their structure, and the consequent loss of steam; at the same time it must be admitted that the improvements in the construction of the steam vessels have materially lessened this serious evil.

490. Experiments made in France support the truth of these reports. MM. Girard and Prony have made separate comparative experiments on the power of low pressure engines, and the condensing engines of mean pressure on Woolf's system, as improved by Edwards. They find that the latter deserves the preference, as to economy of fuel, though their results do not exactly agree as to the extent of the saving in this respect; their conclusions, however, tend to the same end, and their discrepancies are referrible to particular circumstances.

491. Instead of estimating the power of a steam engine by assuming the vague and ill-defined *power of a horse* as unity, it would be better to assume a given weight, raised to a given height in a given time, as one hundred-weight raised one yard in a second, which might be called a *power*. The working force of the engine would thus be indicated by the number of *powers* it is equal to, which may easily be ascertained by loading the piston with a sufficient determinate weight, and marking the space it passes through, so loaded, in one second of time. The tension of the vapor being measured by its relation to the pressure of the atmosphere, taken as unity, it must always be referred to the standard barometrical pressure of thirty inches, and the temperature of 32°.

492. According to the preceding details, it may be assumed as incontestable that it is most economical to employ steam at such a temperature that its tension shall be equal to that of several atmospheres; but it is not so easy to decide to what exact tension it should be raised; or what is the mathematical law which expresses the product of steam engines' powers in the function of the temperature, and the tension resulting from it.

493. We have hitherto, says the report, compared low pressure engines only with those of mean pressure; we now proceed to compare them with high pressure engines, which, as is well known, act without condensation of the vapor. Mr. Trevithick in England, and Mr. Oliver Evans in America, are the persons who first made high pressure engines.

494. In 1814 Mr. Trevithick exported to

Peru nine of these engines, for the purpose of clearing the mines of water, from the accumulation of which many of the richest had been abandoned: so effectual were the engines that the treasurer of the province proposed to erect a silver statue to Mr. Trevithick, as a memorial of the gratitude of the new world, for the services he had rendered it.

495. In Philadelphia the saving in fuel, by the substitution of one of Evans's high pressure engines, for the low pressure one previously employed, amounted to about £1250 per annum. This engine raises 20,000 tons (tonneaux) of water, about ninety-eight feet in height, every twenty-four hours, and consumes about 1535 cubic feet of wood per diem. The prime cost of the machine was rather more than £5000; whereas, according to M. Marestier, a low pressure engine, of equal power, would cost considerably more than £8000.

496. Evans's engines work with a pressure of from eight to ten atmospheres; several of them have been constructed in America; and, in 1814, the congress of the United States extended Mr. Evans's patent ten years beyond the usual period, as an acknowledgment, on the part of the republic, of the benefit his invention has conferred on his country. A similar extension was granted in England to Messrs. Boulton and Watt, for their condensing engines.

497. More lately Mr. Perkins, an American, well known by his ingenious processes for employing steel plates, instead of copper, in engraving, has surpassed all his predecessors by the boldness of his conceptions. He employs, for his moving powers, steam under a pressure of more than thirty atmospheres, and apparently with great advantage.

498. With respect to economy of fuel, we must, therefore, consider the high pressure engines, hitherto constructed, as not having attained the maximum. The use of condensed steam is yet in its infancy; and, notwithstanding the services it has already rendered us, we must consider them as far below what may still be expected, when we shall be more capable of availing ourselves of the full benefit of its effects.

499. Habit reconciles us to danger. Hundreds of sailors perish annually, by the power of the wind on the sails of our ships, and we think nothing of it, because we are become familiar to that mode of navigation. But if a steam-boat be blown up, or burnt, the accident is reported in the public prints to every corner of the world; the alarm is given, and that is looked upon as the most dangerous of all mechanical powers which perhaps is the least so in the common course of navigation, and especially on nearing the land.

500. But destruction in some shapes is more appalling to the imagination than in others. Death from explosions, accompanied with noise and confusion, seems more horrible than when it comes in a more tranquil form; and, in all our discussions on the relative dangers of different machines, we should divest them of those accessory circumstances, which frequently produce the greatest effect on the minds of the vulgar and ill-

informed. Whenever man accumulates natural powers, to effect certain purposes, they may, by mischance, be diverted from their proper courses, and become the cause of serious accidents; and no machine, by which those powers are concentrated, was ever constructed that has not its peculiar dangers.

501. To wish to employ only such machines as might be secure from the consequences of want of skill, imprudence, and rashness, were to wish to deprive ourselves of the happiest fruits of human skill and industry; at the same time it were a culpable neglect to suffer any man, for the sake of attaining an end of secondary importance, to employ means which might obviously endanger the lives and property of his neighbours. In such a case public authority has a right to interfere, and exercise a beneficial and protecting influence.

502. Does this observation apply to steam engines in general, or only to a particular class? Should the use of high and mean pressure engines be restricted to certain situations?

503. The British parliament has lately taken this subject into serious consideration, and has adopted most of the precautions recommended by a committee of the House of Commons appointed to enquire minutely into it, particularly with the view of obviating the dangers to which steam passage-boats are liable from ill-constructed machinery, carelessness, or mismanagement. The committee particularly recommended that the boilers of the steam engines shall be made of wrought iron or copper, and furnished with safety valves, of proper size and form, one of which shall be so secured as to be inaccessible to the workman who has charge of the engine: it also recommends that this valve shall be loaded only with such a weight that the pressure shall never exceed one-third of that which the boiler has been found, by actual trial, to be capable of supporting without bursting, or one-sixth of its calculated strength; and that any person overloading the valve shall be liable to punishment.

504. Although the British legislature has not forbidden the use of high pressure steam engines, either in passage-boats or manufactories, the preference has been given, especially for boats, to low pressure engines; and much prejudice has been excited against the former from deplorable accidents which have occurred in America, in England, and France. Mr. Evans, however, according to Mr. Marestier, has defied his opponents to produce a single instance of the explosion of one of his engines, although they work with a pressure of ten atmospheres. But serious accidents are not confined to high pressure engines—they have happened with those of low pressure, both in England and America; and more than once explosions occasioned by the latter have been attributed to the former.

505. An account is given by Mr. Stevenson, in the Edinburgh Philosophical Journal, of a dreadful explosion which occurred near Edinburgh, of a high pressure steam-boiler; and, in France, accidents have happened both with low, mean, and high pressure engines, which require our particular attention. Explosions, which have cost many persons their lives, have happened

with what are called *low pressure* engines, but which in reality cease to be such whenever the fire is strongly urged, and the escape of the condensed steam prevented, either by the accidental derangement of the safety valves, or by its being purposely overloaded. Amongst others, we may mention the deplorable accident which happened at Creusot, by which many individuals were killed by the bursting of the boiler of a *low pressure* engine. Let us turn to the other engines. At Péronne the balance beam of an English high pressure engine having broken, the steam in the cylinder drove up the piston and its rod through the planks and roof of the building in which it was placed; but no person was killed or hurt.

506. At Paris, the lower part of the boiler of a mean pressure engine having split, the water flowed into the fire-place, and put out the fire; the walls of the furnace were not even shaken, and no noise was heard except that of the rupture of the boiler. A similar accident occurred about three years since in another establishment, unattended by any more serious consequences. But at Essonne a more serious accident happened lately with a mean pressure engine, the boiler of which had been cast at a foundry not calculated for such work; and it has been satisfactorily proved that the mischief was occasioned solely by the clumsy construction of the boiler, and the faulty manner in which its parts were put together. It results, from all the details which we have collected, that no mean or high pressure steam-boiler, constructed in any regular establishment in France, has ever met with an explosion; although they are more numerous than those imported from foreign countries. During the last year thirty-six of these engines have been made in one manufactory at Paris, and a still greater number are making in the present year; and the more they are used the more they are approved of. Since 1815 more than 120 mean and high pressure engines have been made in the French manufactories.

507. Since 1815 thirty-two mean pressure engines have been sent to St. Quentin from one manufactory at Paris; and the purchasers are universally well satisfied with the service they perform.

508. It became important to ascertain if the safety of the French engines, from their introduction to the present time, be merely owing to chance, or if it be the necessary consequence of multiplied precautions in their manufacture, and the previous trials to which the boilers are submitted. On this point the following information has been obtained respecting the cast iron boilers, which are considered as the most unsafe.

509. The mean-pressure condensing engines, on Woolf's construction, are those which are made in the principal manufactory in France. With these engines the pressure may be varied from that of one atmosphere to two and a half, or three atmospheres, and is indicated by a mercurial gauge. The true boiler and boiling pipes in Woolf's engines (which must not be confounded) are made of the purest cast iron. The form of the boiler is cylindrical, its axis being horizontal. The thickness of the boilers and boiling pipes of large and small steam engines

varies from about an inch and a quarter to an inch and three-quarters. The diameter of the boiling pipes is much less than that of the boiler; for small engines it is less than half, for large engines less than one-third, of the diameter of the boiler. The axes of the boiling pipes are parallel to the axis of the boiler; they are placed below it, and immediately over the fire-place, in such a way that the flame is in contact with the pipes only. As the boiler is less exposed to the fire than the pipes, it is less subject to injury from its action; and, if any part give way from that cause, it is the lower part of the pipes, and not the boiler; the consequence of which is the inundation of the fire-place, and extinction of the fire, as happened in one of the accidents mentioned above.

510. The parts of the engine are united with every possible attention to strength, and to closeness at the joints, so that there may be no loss of power from the escape of steam. Before the pipes and boiler are used they are separately submitted, by a hydraulic press, to five times the pressure that they will have to support when the engine is at work. Before any conclusions are drawn from the preceding facts and observations, it may be well briefly to recapitulate them.

511. High-pressure steam engines are employed with most advantage. 1st. Because the greater the compression of the steam the less is the space the engine occupies. 2d. Because it produces an equal power to that of a low pressure engine, with a smaller quantity of fuel. But they are considered as more dangerous than low pressure engines. Nevertheless engines may be constructed with which explosions, if not absolutely impossible, are at least extremely rare; and with which not a single instance of an explosion has occurred in France since they have been used in that country.

512. Such are the mean-pressure engines, of three or four atmospheres, made in France, on Woolf's construction, as improved by Edwards, with boilers four or five times stronger than can be burst by the force of the steam which they have to resist. Such also are the high-pressure engines of ten atmospheres, constructed on the plan of Oliver Evans, of the United States of America. With these engines the boiler is capable of resisting ten times the force it is daily subjected to. But engines constructed with less care, or managed with less prudence, have occasioned dreadful accidents, especially in Great Britain.

513. In France only one accident has ever happened by which any lives were lost, which were those of two individuals engaged in the service of the engine; and not one single instance has occurred in that country in which any damage has been sustained by any individuals, from the explosion of a steam engine, on the adjoining premises.

514. Although it appears, from the preceding statement, that no one in the neighbourhood of a steam engine, in France, has ever suffered either in his person or property from any explosion, yet the impossibility of such consequences has not been proved; and the bare apprehension of the danger is a real evil, attendant on the erec-

tion of a mean or high-pressure steam engine in the neighbourhood of a dwelling house. To reduce that apprehension as much as possible the following precautions should be adopted:—

515. (1.) Every steam engine boiler should be furnished with two safety valves, one of them inaccessible to the workman who attends the engine, the other under his command, in order that he may be able to diminish the pressure on it, as occasion may require. If he attempt to overload this valve, it will have no effect, since the steam will find vent through the other, which is out of his reach. The reporter, M. Dupin, suggests in this place, that if any apprehension of danger be entertained, from the possibility of the inaccessible valve becoming fixed by rust, or negligence, it may be obviated, by fixing in the upper part of the boiler two plugs of fusible metal, formed of such an alloy as to melt at a few degrees above the working temperature of the steam. One of these plugs is to be considerably larger than the other, and to be made of a rather less fusible alloy, so that if the steam does not escape with sufficient rapidity on the fusion of the smaller, it may have ample room to fly off, as soon as the larger has given way. The temperature, at which the least fusible alloy melts, must of course be considerably below that at which the increased elasticity of the steam would endanger the safety of the boiler.

516. (2.) All the boilers should be proved by being submitted, by means of the hydraulic press, to four or five times the working pressure, for engines that work with a pressure of from two to four atmospheres. Beyond that term the proof pressure should as much exceed the working pressure as the latter exceeds the simple pressure of the atmosphere.

517. (3.) Every steam engine maker should be obliged to make known his method of proving the boilers, as well as whatever may guarantee the solidity and safety of his engines, especially as regards the boiler and its appendages. He should also declare this working pressure, estimated by the number of atmospheres, or in pounds, on each square inch of surface exposed to the action of the steam.

518. (4.) For further security, the boilers of very powerful engines, when near a dwelling-house, may be surrounded by a thick wall, at the distance of between three and four feet from the boiler, and at least as far from the party wall of the adjoining house.

519. Lastly, if an exact account were taken, and published by the proper authorities, of all accidents that happen to steam engines of every kind, minutely detailing both the causes and effects of such accidents, with the names of the proprietors, and the makers of the engines, it would mainly tend to render infrequent, though it cannot wholly obviate, the evils that may arise from the use of mean and high-pressure engines.

520. While on the subject of high pressure steam, and the best form of the boiler, we cannot do better than furnish our readers with the substance of a most important paper by Mr. Taylor, the mining engineer. He observes that 'it has been remarked by some practical men who have had most opportunity of examining the circum-

stances under which the bursting of boilers has taken place, that the causes have sometimes appeared to be not of that simple character which is commonly assigned to them; and that some such accidents have occurred where neither excessive expansive force of steam, neglect of the usual precaution, weakness of material or bad construction, existed to a degree equal to the effect. Mr. Woolf, in a conversation upon this subject some time since, expressed to me his opinion of some case where, as he thought, there was ground to suspect the operation of an explosion of gas in the flues, or at least outside the boiler. Any enquiry or discussion into the causes of circumstances which continue to be a reproach to our mode of using steam, must, I conceive, be useful; and my principal object will rather be to provoke it, and to encourage a record of facts, than to propound any particular theory of my own, though I admit that some recent cases appear to countenance Mr. Woolf's idea. In the mines of Cornwall, and in those of North Wales, the use of high-pressure steam has become general: in the former district it is, I believe, universal, and is applied to condensing engines not differing very much from Boulton and Watt's construction, among which engines are many of enormous power, and the largest in the world. The steam is commonly so as to balance from fifteen to forty pounds on each inch of the safety-valve; and some difference of opinion exists among the engineers as to the importance of using it at a higher or lower degree of pressure.

521. 'It will be necessary to describe the boilers which have been employed, in order to understand the subject, and to notice those which have been subject to accidents; which indeed, as far as I know, have been confined to one sort of boiler,—or at least such accidents as have been attended with any fatal or distressing consequences.

522. 'This description of boiler, though appearing therefore to be the most hazardous, is yet most generally adopted; and, as it is believed to have some advantages over others in other respects and under certain circumstances, it will probably continue to be generally preferred, or at least until some construction that shall unite these advantages with more perfect security may be brought into use: this, indeed, it will not be very easy to do, as the experiments on boilers have been multiplied to a great extent in Cornwall, and the expense incurred by many of the mines in this way has been so great that but few of the managers will probably be inclined to enter upon them again without some very clear prospect of success.

523. 'The steam boilers which I mean to describe as the most common are those which are constructed by fixing one tube within another: the interior one containing the fireplace, and the space between it and the exterior containing water, and in the upper part steam. This kind of boiler was, I believe, first introduced by Trevithic for his simple high-pressure engines: he made the outer tube of cast iron, and the inner one, which was often recurved so as to make a double circuit within, of wrought iron. At

present both the tubes are made of wrought iron or rolled plates: the form is simply that of one straight tube passing through the other; the ends of the boiler fix the tubes together, so that the interior tube is open at both ends; at one of which is placed the fire-grate, and at the other the smoke and flame pass out, and are conveyed to the stack or chimney most commonly by flues passing under and along the sides of the outer case. The boilers are commonly from twenty to thirty-five feet in length, the diameter of the inner tube from three to four feet, and of the outer one from five and a half to six and a half or seven feet. The former are usually half an inch thick, and the outer case three-eighths.

524. 'The weakest parts of this construction have generally been supposed to be the outer tube, by having too great a diameter for the strength of iron used, and the ends of the boiler, which, by being square and rivetted to angle iron, are more likely to break than if a spherical form were adopted. It does not appear, however, in practice, that these have been the first parts to give away.

525. 'The advantages which this boiler seems to possess over others may be shortly stated. It has been found, by comparing the duty of the engines by means of the monthly reports, and checking this by the observations of the agents, that the fuel goes further in them than in any others yet tried. Circumstances, at first sight apparently trivial, may perhaps conduce to this result. I suspect that the peculiarities of coal of different districts influence more the success of different kinds of boilers than has been generally supposed. In Cornwall all the coal is from South Wales, and is brought from the neighbourhood of Swansea; it is less bituminous than most other coal, is not easy to inflame, but gives a strong and durable fire: it is subject to the objection of producing a great deal of clinker, and this unites with and adheres strongly to any brick-work which the fire may come in contact with, so as to require frequent cleansing of the fire-place. In the boilers I have been describing there is no brick-work near the fire, the clinker does not adhere to the iron sides, and the process of cleansing is easy and rapid; the action of the fire is therefore regular and uninterrupted.

526. 'The second kind of boiler used is a single tube made of wrought iron plates of considerable length but of small diameter, with ends of the same material generally of a hemispherical form; it is placed horizontally, the water occupying by far the larger portion of the space within, and the fire is applied under the bottom part.

527. 'In our mines in North Wales I have used them with great advantage, and our agents and engineers prefer them to any other, and find that they generate steam rapidly, and apparently with economy; but, as there is no monthly report there as in Cornwall, this point cannot be ascertained precisely.

528. 'I expected the same advantage by using them in Cornwall, with the further one of increased security. In this I have been disappointed: the difference in the quality of the coal

appears to be the reason;—in North Wales it is a free burning and bituminous coal, and makes little or no clinker, and therefore essentially different from what I have described the coal used in Cornwall to be. With the latter these boilers do not appear to afford steam freely; whilst the brick sides of the fire-place are so rapidly encrusted with clinker, and the door so frequently kept open to cleanse them, that much of the effect of the fire is destroyed.

529. 'The third class of boilers which have been used in the mines is that which includes Mr. Woolf's invention of a series of tubes filled with water and exposed to the fire. These boilers were the subject of one of his patents, and various descriptions of them are to be found in works which treat on these subjects. If one objection to them could be surmounted, they would probably be the best description of boilers we know of, but this has caused the use of them to be discontinued;—the tubes by expanding and contracting not only injure the joints, which must necessarily be numerous, but by sudden influences of the fire the water is displaced in some of them, and the tubes are injured and burst. No other inconvenience has occurred from this than what is occasioned by the frequent repairs thus called for; but it amounts of itself to a serious evil.

530. 'Of four accidents by the bursting of steam boilers which have come more under my notice as having occurred in mines where I am interested, and in the last two or three years, I would remark that the boilers were all of the first description. In other respects the circumstances differed very much. They were erected under the superintendence of different engineers, —were made by different manufacturers, in parts of the country distant from each other, of materials from various sources; they were mostly nearly new or not apparently the worse for wear, and were each furnished with a safety-valve and gauge cocks; though I admit that there is not so much attention to the care of these matters in the boiler-houses of mines as could be wished.

531. 'The first accident was at Wheal Fortune, to one of six boilers which are employed to work the large engine there of ninety inch cylinder. I do not recollect that any thing remarkable occurred to observe upon with regard to this; the injury was limited to the boiler itself, and it occasioned no particular discussion. The engineer was Mr. Woolf.

532. 'The next was extraordinary, from the circumstance of two boilers blowing up at the same moment or nearly so. This happened at Polgooth tin mine, where three were employed in the same house to work the engine (eighty inch cylinder). The engine had been stopped a short time for some repairs to the pump-work in the shaft; but it seemed clear after the accident, by the most accurate investigation that could be made, that the steam had not acquired any formidable degree of pressure, nor was the water so low as to endanger the tube being improperly neated. The engineer was Mr. Sims, and the boilers as well as the engine were nearly new. One man, unfortunately, was killed, and the stack of the engine-house was much shattered, as

well as the building itself. The interior tubes of the boilers were much contorted and rent. Captain Reed, who was near the spot, remarked that the one explosion was heard a little before the other, but the noise had hardly ceased when the second took place.

533. 'Some time after, one of the boilers of the sixty-four inch cylinder engine at East Crennis Mine blew up. This engine was also under the care of Mr. Sims, but had been much longer at work than that at Polgooth. The inner tube was compressed as if the fire had softened the part above it, though there did not appear to be any other reason to think that the water was too low. The ends were torn to pieces, and the tube was projected out of the case and out of the house, while the case itself remained in its place, and scarcely injured. No person was materially hurt.

534. 'The last accident, which has led more particularly to these remarks, happened at the Mold Mines in Flintshire, to a boiler of a similar construction; one of three working the Pen-y-Fron engine sixty-six inch cylinder erected by Captain Francis the principal agent, but of late under the care of Mr. Bawden, engineer. The outer case remained in its seat uninjured, as at East Crennis, and even the weight on the lever of the safety-valve was not disturbed; the inner tube was not moved out of its place, although it was very much flattened or compressed for a great part of its length, but in a contrary direction to that at East Crennis; the sides as it were having come together, and not the top and bottom, they approached so close to each other as to hold a brick, which it is not easy to account for being there. The part which contained the fireplace, and for some length near it, remained in the original form. The ends both here and at East Crennis presented an appearance as if they had broken the angle iron rather by the contraction of the tubes than by being pressed outwards.

535. 'Circumstances rendered it possible to get better evidence of the state of the steam and water, &c., than happens in most such instances; and it seemed certain that the former did not exceed a pressure of thirty pounds an inch, and that the other was quite at its proper height. There was a lead plug indeed above the fire which would have been destroyed if it were not so.

536. 'The engine had been stopped a few minutes; the engine-man had opened the fire-doors of the three boilers, and had closed the dampers of the other two: he was on this boiler, putting down the damper in the flue, which was no sooner done than he observed a gust of flame rushing from the fire-place, and almost immediately after an explosion, which made him jump from a door-way considerably above the level of the ground below, as the engine stands on the side of a steep hill: this door was used to discharge the cinders from the ash-pits. He alighted on the heap, and escaped out of the way just before the hot water gushed out. Two other men, who were in the boiler-house, were not so fortunate, and they were killed instantly by the boiling water, no mark of any other injury being to be found on their bodies. In this case, had the rush

of flame from the fire-place any thing to do with the subsequent explosion? And admitting that the steam was so far within the pressure that could by mere expansive force regularly exerted injure such a boiler—might not the rupture be occasioned by the aid that a vacuum suddenly created might produce?

537. 'Does not the bursting of the one boiler after another, as at Polgooth, seem to indicate that exterior causes operated? Is it possible to conceive, supposing the pressure equal in two boilers, as was the case at Polgooth, both being connected to the same steam-pipe, that the relative strength of the two should be so exactly the same as that what would by mere expansive force burst the one should have the same effect upon the other?

538. 'Have not all calculation and reasoning with respect to the strength of boilers hitherto had regard merely to such expansive force uniformly exerted; and if we suspect or admit the action of concussion, or the effects that any thing like a blow would exert, ought we not to make a very different estimate in their construction? My intention was rather to state the facts than to attempt an explanation of what is certainly at present very obscure; but, that I may do all in my power to direct attention to the subject, I will venture on a supposition. At the Pen-y-Fron engine we see that the fire-door is thrown open, and then the current of air up the flue is stopped by closing the damper; the interior is filled with atmospheric air mixed to a certain extent with coal gas; the latter is increased by the distillatory action of the fire until the proportion is attained which is explosive; it takes fire, producing the rush of flame which would be followed by a sudden vacuum in the tube; while the other side, pressed by the steam, gives way to this sudden impulse, and is destroyed by a force very much smaller than would be required if uniformly exerted. By some it has been suggested that hydrogen may have been generated by the decomposition of water from leaks in the boiler.

539. 'That sudden inflammations of gas in the chimneys of these engines do take place is, I believe, sufficiently obvious. By night it is observable that bursts of flame, suddenly illuminating the surrounding scene, and rising to a considerable height above the summit of the stack, are seen to emerge, and after a blaze of some minutes diminish and retire into the flue, leaving all once more in perfect darkness. This effect I certainly do not recollect to have noticed where the coal is less bituminous. The fact is not, perhaps, of much importance; but it has been remarked upon by some who have witnessed the accident I have described, and has been discussed by them in reference to it, and therefore it is right to mention it.

540. 'Though I have been led to describe the bursting of boilers where what is called high-pressure steam has been used, I by no means think that boilers are safer because the steam in them is supposed to be limited to a lower degree of expansive force. High-pressure boilers are or ought to be very strong, and can only give way by a great increase of force beyond what they are calculated to resist, which should hap-

pen but seldom. Low-pressure boilers are from their construction very weak, and a little carelessness raises the power of the steam within them to the bursting point, and when they give way the consequences are often very fatal. Not to mention other instances, I may remark, that about twelve months since one of the old spherical construction, which is still much used in some parts of the kingdom, burst at a mine in Flintshire, about seven miles from the Mold Mines, and occasioned the death of sixteen persons; it was replaced by two smaller boilers of the second kind I have described, and high-pressure steam applied with good effect to the engine, and with perfect security.'

541. The patent American engine by Mr. M'Curdy is adapted for steam of great expansive force. Instead of boilers, for producing steam, the patentee proposes to use tubular chambers, which being brought to a due degree of heat, by any of the usual methods, water is to be injected into them by a forcing pump, through a pipe an inch in diameter, that passes along the centre of each, and has small perforations on every side, through which it is emitted in 'sprees,' or small streams, against the inside of the chambers. The water being then converted instantly into steam, by the heat of the chamber, the steam passes off by a tube at its other end, to work the piston of a steam cylinder in the common manner. From the bottom of each chamber a pipe descends, furnished with a cock, by which may be known whether the whole of the water injected each time by the pump be converted into steam; the quantity of which, to equal a four or five-horse power, should be about 'half a gill.'

542. To add to the power of the engine the number of tubular chambers may be increased, together with the heat applied to them, and the portion of water injected. To cut off the communication between each separate chamber and the rest, in case of accidents, cocks are added to the pipes where the water enters them, and where the steam goes forth.

543. In using these tubular chambers, at first the forcing pump is to be worked by hand, till the pressure of the steam is found to be what is required, after which the engine is set to work, and moves the forcing pump or pumps with the rest of the machinery.

544. The patentee divides his claims relative to this patent into three heads; the first of which comprises the tubular chambers; the second the mode of distributing the water evenly in them by the perforated tube; and the third the method of getting a 'head' or pressure of steam before the engine begins to work. We understand that the general size of the tubular chambers which the patentee has tried is eleven or twelve feet in length, and about six inches in diameter inside, and that they are made of wrought iron.

545. There are several contrivances for consuming smoke in steam engine furnaces that are especially worthy of consideration. Indeed a parliamentary enquiry has been instituted into the subject. In this there are two inventions for the destruction of smoke, which appear princi-

pally to have occupied the attention of the committee, and which also profess to accomplish that desirable object with a very considerable saving of fuel.

546. Mr. Brunton is the patentee of one of these inventions; he applies to the engine-boiler a newly constructed fire-place, containing a circular grate, which is made slowly to revolve upon its axis; the fire upon this grate is fed in front by a kind of hopper, continually delivering small coal, which, from the rotatory motion of the grate itself, becomes equally spread upon its surface, so as to maintain a thin fire and a sharp draught; the coal is thus rapidly and perfectly decomposed and burned, the smoke at first produced having to pass across the grate and over the red-hot and already coked fuel. The great advantages of this plan consist in the uniformity of heat, and its proportionate production to the work which the engine has to perform, or to the quantity of steam consumed; the fire bricks are not injured; the clinkers or scoræ are produced in thin layers; and the bars are so little heated that, while three bushels of coal per hour are consuming, they are seldom hot enough to singe paper; the boilers are less injured than by a common fire; and there is a considerable saving in the consumption of fuel. The disadvantages of Mr. Brunton's plan are, the expense of the apparatus; the requisite alteration of the boiler, or rather the addition of a supplementary boiler; the necessity of a moving power to effect the rotation of the grate; and the labor of breaking the coals into small pieces before they are put into the hopper. Upon the last point Mr. Brunton, when questioned by the committee, replies as follows:— 'No coals should be put on a steam engine fire until they are small enough to pass a three-inch mesh; therefore the necessity of breaking the coal to that size is advantageous; but we have lately burned a species of small coal in our own furnace, and also in the town of Birmingham, which has till now been regarded as perfectly useless, and as such there are thousands of tons encumbering the ground in the Staffordshire collieries, incapable of being used with effect in any other furnace, and we have produced with this hitherto supposed rubbish seventy per cent. of the effect of saleable coal.'

547. How far Mr. Brunton's invention bears upon the main point of our enquiry, namely, the consumption of smoke, will appear from the following evidence: Mr. James Scott Smith, of the Whitechapel Distillery, says, 'We can consume the smoke to a very great extent, and, although it is not completely invisible, yet it is never offensive; we never have any of those dark volumes of smoke which are the cause of so much complaint.' Mr. Brancker, of Liverpool (a sugar refiner), also gives evidence as to the great diminution of smoke effected by Mr. Brunton's 'fire-regulator;' and both these gentlemen speak in terms the most unequivocal respecting the saving of fuel, amounting, according to their joint evidence, to from thirty to thirty-eight per cent. Upon this subject, however, we greatly apprehend that such evidence is open to unavoidable fallacy. When any new thing is going on in a manufactory, the heads of the concern are gene-

rally themselves on the alert, and more than ordinary care and attention are bestowed upon all its details; we are pretty well convinced, and it is indeed obvious, that in any great establishment a monstrous saving of all materials, but of coals more especially, would be effected by the personal superintendence of the master, and of scientific persons well versed in the minutæ of the concern; yet we are willing to allow that one great merit of Mr. Brunton's contrivance consists in its being almost independent of the stokers and laborers; there is none of that eternal pitching of coals into the furnace which goes on with such lavish waste in all ordinary engine fires; 'the grand principle in this machine,' says Mr. Smith, 'is, that it makes all stokers alike good, and they always use the same quantity of coals when doing the same work.' This is indeed a great point carried. We think it but justice to Mr. Brunton to add that private information, derived from various quarters, confirms, to a considerable extent, the extracts we have made from the Minutes of Evidence; we are inclined to consider the saving of fuel quite as important as the consumption of smoke, and in that respect his pretensions seem indisputable; there is also much original ingenuity in his contrivance; indeed we are not aware that a rotatory grate was ever before either devised or constructed.

548. Another very effectual, and in some respects preferable method of consuming smoke, is the invention of Messrs. Parkes, of Warwick. These gentlemen, who are the proprietors of an extensive worsted manufactory, were greatly annoyed by the smoke of their engine-boilers, especially in their bleaching and drying ground; they have now so far effected its consumption that, for about twelve hours of the day, the smoke is nearly invisible, and there is no soot; moreover these desirable objects are accompanied, they say, by a considerable saving in the article of coals.

549. In the plan adopted by Messrs. Parkes the boilers remain in statu quo; the fire-place is somewhat altered in shape and dimensions, but the principal agent, as far as regards the destruction of the smoke, is a current of air which is admitted just beyond the end of the fire-place, by means of an aperture which may be increased or closed at pleasure, and which they call an air-valve. A small fire is first made to burn brightly at the back of the grate; coals are then filled in towards the front, in which direction the fire gradually spreads; their smoke necessarily passes over the clear fire, where it becomes sufficiently heated to constitute flame, as soon as it meets with the current of air entering at the valve; and a striking experiment with this apparatus consists in alternately shutting and opening the air-valve, which is accompanied by the alternate appearance and disappearance of the smoke.

550. Even from this brief and incomplete view of Messrs. Parkes' contrivance, it is obviously preferable, in some respects, to that of Mr. Brunton; it is much less complex and expensive, and, when properly and assiduously attended to, it effects a more complete destruction of smoke; but, on the other hand, its success is infinitely

more dependent upon the persons who manage the fire, and whose dispositions are generally a mixture of ignorance and prejudice, duly tempered with the warmth of the element over which they preside; we also doubt whether the same unequivocal testimony can be adduced in respect to the saving of fuel, for this again is more in the stoker's power. In point of originality, too, Mr. Parkes must undoubtedly yield the palm to Mr. Brunton; he is anticipated in every part of his invention by the words of Mr. Watt's patent; and we rather think that Mr. Gregson has also touched upon some of the most important parts of his contrivance. We, however, by no means state this opinion with a view to detract from Mr. Parkes's merit; on the contrary, if he has attained that in which Mr. Watt failed, the nearer his means approach to those unavailingly employed by his eminent predecessor, the more substantial is the service which he has rendered the public, and the more praiseworthy the perseverance by which he has accomplished his object. We believe that Mr. Watt never affected to combine diminution in the consumption of fuel with the destruction of smoke, and that, on the contrary, with additional expense and trouble, there were more coals burned; at least this is the only cause to which we can refer the non-consumption of smoke, and the non-application of his patent, in the greater number, if not in all, the large engines of his erection which we have had occasion to visit.

551. One subject seems to us to have been overlooked by the majority of smoke-reformers, namely, the construction, and more especially the height, of the furnace chimneys. By conveying black smoke, and other pernicious fumes, into a capacious and very lofty chimney, much of the noxious matters that otherwise escape into the atmosphere are decomposed and precipitated, or condensed within; we were much struck some years ago with the effect of a long flue and lofty chimney attached to the steam engine of the Dartford Powder-mills; scarcely any smoke issued from its funnel, the fuliginous particles being almost entirely deposited in the chambers of the flue. The chimneys of the grand junction engine at Paddington, and of the West Middlesex water-works at Hammersmith, are more illustrative instances; when these machines are at work the former produces little smoke; the latter inundates the neighbouring gardens with perpetual showers of the solid soot, and is the greatest of all conceivable nuisances; yet the only difference is in the height of the two chimneys, the boilers being in all respects set and constructed alike. Besides, if a high chimney does void smoke, it is generally wafted away and dissipated, except under particular circumstances of wind and weather.

552. As to the requisite height of a chimney for the diminution of nuisance from smoke we are not

prepared to give an opinion; it will depend very much on the circumstances of the case; from 150 to 200 feet would, we presume, in most instances, prove effectual; the expense of such a structure may certainly be urged against the proposal, but we are to recollect that one shaft might receive all the tributary fumes of many flues, and that a great saving would be effected in reducing the number of chimneys of medium height. The intolerable nuisance of brewers' chimneys, to whose coppers we fear neither Parkes's nor Brunton's inventions are applicable, would in this way be greatly diminished, if not altogether remedied.

553. Among other probable causes of the diminution of smoke, we look to the employment of steam as a substitute for fires; in Whitbread's brewery high-pressure steam is thus very extensively employed, and, although they make quite smoke enough, it certainly has lately sustained a very perceptible diminution.

554. Lastly, we come to the most absurd portion of the speculations of theoretical smoke-burners, namely, the improvement of the atmosphere of the metropolis. Though some are sceptical upon the subject, we will admit that, if no smoke were made in London for a twelve-month, or if wood-fuel were substituted for coals, there might be some amelioration of the atmosphere, although our locality and climate always render it turbid and misty, independent of adventitious effluvia; it is, however, folly to ascribe any sensible influence upon the great mass of London smoke to some few steam engine chimneys, while every house is busy in the work of contamination, and every street yielding a proportion of filth far exceeding that of any single furnace, though less observed, because administered by separate vents, and in divided doses.

555. A portable high-pressure engine is a desideratum of considerable importance in the erection of buildings and other temporary works. We propose therefore concluding our present article with an account of one which is exceedingly simple in the arrangement of its parts. Fig. 1 plate IV. is an external elevation, and fig. 2 a section of the apparatus. The same letters of reference are employed in both. The cylindrical boiler is represented at A, the cylinder and piston entering at the top of one extremity, and the chimney passing from the other. A four-way cock *i f k* serves to limit and regulate the passage of the steam above and beneath the piston. The steam after its escape passes by the pipe *a r F* into the chimney T. E, F, are the flanches of the chimney, the clearing hole being placed at Y. The steelyard safety-valve is seen at *p n v*. The piston-rod is kept in its proper situation by the guides H, I, K, L, and the fly-wheel M is driven by a connecting-rod and crank attached to the wheel N.

 WORKING-BEAM, account of the, 374.

STEATITE, or soapstone, in mineralogy, a sub-species of rhomboidal mica. Color grayish, or greenish-white. Massive, disseminated, imitative, and in the following supposititious figures: an equiangular six-sided prism; an acute double six-sided pyramid; and a rhomboid. The first

two are on rock crystal, the last on calcareous spar. Dull. Fracture coarse splintery. Translucent on the edges. Streak shining. Writes but feebly. Soft. Very sectile. Rather difficultly frangible. Does not adhere to the tongue. Feels very greasy. Specific gravity 2.4 to 2.6.

Infusible. Its constituents are, silica 44, magnesia 44, alumina 2, iron 7.3, manganese 1.5, chrome 2. Trace of lime and muriatic acid. It occurs frequently in small contemporaneous veins that traverse serpentine in all directions; at Portsoy and Shetland; in the limestone of Icolmkill; in the serpentine of Cornwall; and in Anglesey. It is used in the manufacture of porcelain, and for taking greasy spots out of silk and woollen stuffs. It is also employed in polishing gypsum, serpentine, and marble. When pounded, and slightly burned, it forms the basis of certain cosmetics. It writes readily on glass. Humboldt assures us that the Otomacks, a savage race on the banks of the Orinoco, live for nearly three months of the year principally on a kind of potters' clay; and many other savages eat great quantities of steatite, which contains absolutely no nourishment.

STEATOMA, *n. s.* Gr. *στεατωμα*. A fat wen. If the matter in a wen resembles milk-curds, the tumour is called atheroma; if like honey, meliceris; and if composed of fat, *steatoma*. *Sharp's Surgery*.

STEATOMA is a kind of encysted tumor, consisting of a matter like suet or lard, soft, without pain, and without discoloring the skin.

STEBBING (Dr. Henry), a learned English divine and controversialist. He attacked the bishop of Bangor, Dr. Sykes, and bishop Warburton; and published many tracts and sermons. He died in 1763.

STEED, *n. s.* Sax. *stæda*. A horse for state or war.

My noble *steed* I give him,
With all his trim belonging. *Shakspeare. Macbeth*.
Impresses quaint, caparisons and *steeds*. *Milton*.
Stout are our men, and warlike are our *steeds*.

She thought herself the trembling dame that fled,
And him the grisly ghost that spurred the infernal *steed*.
Waller. Dryden.

Who like our active African instructs
The fiery *steed*, and trains him to his hand? *Addison*.

See the bold youth strain up the threatening
steep;
Hang o'er their coarsers' heads with eager speed,
And earth rolls back beneath the flying *steed*. *Pope*.
Some nymphs affect a more heroic breed,
And vault from hunters to the managed *steed*.
Young.

STEEDMAN (captain John Gabriel), a Scottish navigator, born in 1745. He wrote an interesting Narrative of an Expedition against the revolted Negroes of Surinam, in 2 vols. 4to., with eighty engravings from his own drawings. He himself was much concerned in the military transactions related in it. He died at Tiverton in Devonshire, in 1797.

STEEL, *n. s., adj., & v. a.* } Saxon *stæal*;
STEEL'Y, *adj.* } Belg. *stael*; Goth.
stal. A kind of iron refined and purified by fire with other ingredients. See below. Made of steel: to point or edge with steel; to harden: steely is made of steel; or hard, firm.

That she would unarm her noble heart of that
steely resistance against the sweet blows of love.
Sidney.

At her back a bow and quiver gay,
Stuffed with *steel*-headed darts, wherewith she
quelled
The savage beasts in her victorious play. *Spenser*.

Brave Macbeth with his brandished *steel*,
Which smoked with bloody execution,
Carved out his passage till he had faced the slave.

Add proof unto mine armour with thy prayers,
And with thy blessings *steel* my lance's point.
Id. Richard II.

Lies well *steeled* with weighty arguments.
Shakspeare.

From his metal was his party *steeled*;
Which, once in him rebated, all the rest
Turned on themselves, like dull and heavy lead.
Id.

O God of battles! *steel* my soldier's hearts,
Possess them not with fear.
Id. Henry V.

Thy brother's blood the thirsty earth hath drunk,
Broached with the *steely* point of Clifford's lance.
Shakspeare.

A looking-glass, with the *steel* behind, looketh
whiter than glass simple. *Bacon's Natural History*.
With mighty bars of long enduring brass
The *steel*-bound doors, and iron gates he ties.

They are not charmed against your points, of *steel*
nor iron framed.
Fairfax. Chapman.

A lance then took he, with a keene *steede* head,
To be his keepe off both 'gainst men and dogges.
Id.

Diamonds, though hard bodies, will not readily
strike fire with *steel*, much less with one another; nor
a flint easily with a *steel*, if they both be wet; the
sparks being then quenched in their eruption.
Brown's Vulgar Errors.

Both were of shining *steel*, and wrought so pure,
As might the strokes of two such arms endure.
Dryden.

He, sudden as the word,
In proud Plexippus' bosom plunged the sword;
Toxeus amazed, and with amazement slow,
Stood doubting; and, while doubting thus he stood,
Received the *steel* bathed in his brother's blood. *Id.*

Why will you fight against so sweet a passion,
And *steel* your heart to such a world of charms?
Addison.

Man, foolish man!
Scarce know'st thou how thyself began;
Yet, *steeled* with studied boldness, thou dar'st try
To send thy doubted reason's dazzled eye
Through the mysterious gulf of vast immensity.
Prior.

Here smokes his forge, he bares his sinewy arm,
And early strokes the sounding anvil warm;
Around his shop the *steely* sparkles flew,
As for the *steed* he shaped the bending shoe. *Gay*.
After relaxing, *steel* strengthens the solids, and is
likewise an anti-acid. *Arbuthnot*.

Let the *steeled* Turk be deaf to matron's cries,
See virgins ravished with relentless eyes. *Tickel*.
So perish all whose breasts the furies *steeled*,
And cursed with hearts unknowing how to yield.
Pope.

Steel is made from the purest and softest iron, by
keeping it red-hot, stratified with coal-dust and wood-
ashes, or other substances that abound in the phlog-
iston, for several hours in a close furnace.
Hill's Materia Medica.

STEEL, in modern chemistry and metallurgy,
has been defined to be iron united with carbon.
See **IRON**. Steel has properties distinct from
those of iron, which render it of superior value.
From its higher degree of hardness it admits a
finer polish and assumes a brighter color. When
tempered, it possesses a higher degree of elasti-
city, and is more sonorous. It is more weakly

attracted by the loadstone, it receives more slowly the magnetic power, but it preserves it longer. When exposed to a moist air, it does not contract rust so easily as iron. It is also heavier, increasing in weight, according to Chaptal, 170th part. M. Rinman has given, as the result of several accurate experiments on different kinds of steel, the following specific gravity 7.795, while he makes ductile iron 7.700, and crude iron 7.251. All iron is convertible into steel, by exposing it to a certain degree of heat for a certain time, along with a quantity of charcoal. Chemists differ in opinion concerning the nature and effects of this process. Some say that steel is produced by absorbing a quantity of caloric. Lavoisier seems to have ascribed the qualities of steel to a slight degree of oxidation; others to a combination with plumbago, and others to a union with carbon. In agreeing with those who say the formation of steel is owing to carbon, we do not differ essentially from those who attribute it to plumbago; for the art of chemistry has now found that these substances are very nearly allied. See CHEMISTRY. There are two ways of making steel; by fusion and by cementation. The first is used to convert iron into steel immediately from the ore, or from crude or cast iron. By the second way, bar iron is exposed to a long continued heat surrounded by charcoal. Each of these ways has advantages peculiar to itself; but the same causes in fact predominate in both, for both kinds of steel are produced by heat and charcoal. The only difference between the two methods is this: in making steel by fusion the charcoal is not so equally defended from the access of air as in the other way. See IRON. The method of converting iron into steel by cementation is a very simple process. It consists solely in exposing it for a certain time to a strong degree of heat, while closely covered with charcoal and defended from the external air. The furnaces employed for converting iron into steel (says a manufacturer of this metal) are of different sizes; some capable of converting only three or four tons weight, while others are capacious enough to contain from seven to eight or ten tons. The outsides of these furnaces rise up in the form of a cone or sugar-loaf, to the height of a very considerable number of feet. In the inside, opposite to each other, are placed two very long chests, made either of stone, or of bricks capable of bearing the strongest fire; which is placed between the two chests. The bars of iron, after the bottom is furnished with a necessary quantity of charcoal dust, are laid in stratum super stratum, with intermediate beds of the charcoal dust, to such a height of the chests as only to admit of a good bed at top; which is then all covered over, to prevent the admission of the common air; which, could it procure an entrance, would greatly injure the operation. The iron being thus situated, the fire is lighted, which is some time before it can be raised to a sufficient degree of heat to produce any considerable effect; after which it is continued for so many days as the operator may judge proper; only now and then drawing out what they call a proof-bar. This is done by openings fit for the purpose at the ends

of the chest, which are easily, and with expedition stopped up again, without occasioning any injury to the contents left behind. When the operator apprehends the conversion is sufficiently completed, the fire is suffered to go out, and the furnace, with its contents, is left gradually to cool. This may take up several days; after which the furnace is discharged, by taking out the bars of steel and the remainder of the charcoal dust. There is a manufactory established in the parish of Cramond, about five miles from Edinburgh, in which this method is practised with great success. Great quantities of steel are made there which is said to be of as excellent a quality as any that can be procured from other countries. When the charcoal is taken out, it is found as black as before it was introduced into the furnace, unless by accident the external air has got admittance. The bars preserve their exterior form only; the surface frequently exhibits a great number of tumors or blisters, whence they are called blistered steel. The hardness of steel is much increased by tempering. This consists in heating it to a red heat, and then plunging it suddenly into cold water. If it be allowed to cool slowly it still preserves its ductility; or, if it be heated again after being tempered, it loses its hardness, and again becomes ductile. In heating steel for tempering it, the most remarkable circumstance is the different colors it assumes, according to the degree of heat it has received. As it is gradually heated, it becomes white, then yellow, orange, purple, violet, and at last of a deep blue color. According to Reaumur, the steel which is most heated in tempering is generally the hardest. Hence it is believed that the more violent the heat to which steel is exposed, and the more suddenly it is plunged into cold water, the harder the steel will be. Rinman, again, has deduced a conclusion directly opposite, that the steel which is naturally hardest demands the least degree of heat to temper it. Different methods have been proposed to determine what degree of heat is most proper; but the easiest method is to take a bar of steel, so long that while one end is exposed to a violent heat the other may be kept cold. By examining the intermediate portions, it may be found what degree of heat has produced the greatest hardness. By tempering, steel is said to increase both in bulk and in weight. Reaumur says that a small bar six inches long, six lines broad, and half an inch thick, was increased at least a line in length after being tempered to a reddish white color; that is, supposing the dilatation proportional in all dimensions increasing at the rate of 48 to 49. Iron also expands when heated; but, when the heat passes off, it returns to its former dimensions. That the weight of steel is also augmented by tempering has been found by experiment. Rinman having weighed exactly in an hydrostatic balance two kinds of fine steel made by cementation, and not tempered, found their density to be to that of water as 7.991 to 1; after being tempered the density of the one was 7.553, and that of the other 7.708. M. de Morveau took three bars just of a size to enter a certain calibre twenty-eight lines long, and each side two lines broad; one of the bars was

soft iron, and the two others were taken from the same piece of fine steel. In order to communicate an equal degree of heat to each, in an earthen vessel in the midst of a wind furnace, the bar of soft iron and one of the bars of steel were thrown into cold water; the other bar of steel was cooled slowly over some pieces of charcoal at a distance from the furnace. The bar of iron, and the one of steel that was allowed to cool slowly, passed easily into the calibre again; but the bar of tempered steel was lengthened almost one-ninth of a line. Tempering changes the grain, or at least the appearance of the texture of a piece of steel when broken. This is the mark, which is usually observed in judging of the quality of steel, or of the tempering which suits it best. The tempered bar is broken in several places after having received different degrees of heat in several places. What proves completely the effect of heat upon the grain, at least in some kinds of steel, is that a bar of steel exposed to all the intermediate degrees of heat, from the smallest sensible heat to a red heat, is found to increase in fineness of grain from the slightly heated to the strongly heated end. The celebrated Rinman has made many experiments on the qualities of steel exposed to different degrees of heat in tempering, but particularly to three kinds, viz. steel heated to an obscure red, to a bright red, and to a red white. Hard brittle steel, made by cementation, and heated to an obscure red, and tempered, exhibited a fine grain, somewhat shining, and was of a yellow white color. When tempered at a bright red heat, the grain was coarser and more shining; when tempered at a red white heat, the grain was also coarse and shining. To determine how far steel might be improved in its grain by tempering it in different ways, M. de Morveau took a bar of blistered steel, and broke it into four parts nearly of the same weight. They were all heated to a red heat in the same furnace, and withdrawn from the fire at the same instant. One of the pieces was left at the side of the furnace to cool in the air, the second was plunged into cold water, the third into oil, and the fourth into mercury. The piece of steel that was cooled in the air resisted the hammer a long time before it was broken; it was necessary to notch it with the file, and even then it was broken with difficulty. It showed in its fracture a grain sensibly more fine and more shining than it was before. The second piece, which had been plunged into water, broke easily: its grain was rather finer than the first, and almost of the same white color. The third piece, which was tempered in oil, appeared very hard when tried by the fire; it was scarcely possible to break it. Its grain was as fine, but not quite so bright, as that which was tempered in water. The fourth piece, which was dipped into mercury, was evidently superior to all the rest in the fineness and color of the grain. It broke into many fragments with the first stroke of the hammer, the fractures being generally transverse. M. de Morveau repeated these experiments with finer steel, and with similar results. From these experiments, it appears that steel may be hardened by tempering it with any liquid which is capable of accelerating its cooling. Steel may be unmade, or reduced to the state of iron, by a management

similar to that by which it is made, that is, by cementation. But the cement used for this purpose must be composed of substances entirely free from inflammable matter, and rather capable of absorbing it, as calcareous earth or quicklime. By a cementation with calcareous earth, continued during eight or ten hours, steel is reduced to the state of iron. After it has been tempered, it may be again untempered and softened to any degree that we think proper; for which purpose we have only to heat it more or less, and to let it cool slowly. By this method we may soften the hardest tempered steel.

For the following important facts respecting the manufacture of steel Dr. Ure was indebted to the proprietor of the Monkland manufactory, where bar and cast steel of superior quality are made.

The chests or troughs in which the iron bars are stratified are nine feet long, and composed of an open-grained siliceous freestone, unalterable by the fire. The Dannemora or Ore-grounds iron is alone employed for conversion into steel at Monkland. The increase of weight is from four to twelve ounces per cwt. The average is therefore 1 in 224 parts. The first proportion constitutes mild, and the second very hard steel. Should the process be pushed much farther, the steel would then melt, and in the act of fusion would take a dose of charcoal sufficient to bring it to the state of No. 1, cast iron. The charcoal used in stratifying with the bar iron is bruised so as to pass through a quarter-inch riddle. Whenever the interior of the troughs arrives at 70° Wedgewood, the carbon begins to be absorbed by the iron. There is no further diminution of the weight of the charcoal than what is due to this combination. What remains is employed at another charge. Great differences are found between the different kinds of bar iron imported at the same time; which occasion unexpected differences in the resulting steel. The following letter contains important information, from a gentleman possessing great experience in the manufacture of steel.

‘Monkland steel-works,

‘9th November, 1820.

‘Sir,—Mr. William Murray has written me, that you wished I should communicate to you the reason why bar iron should run into the state of soft cast iron, by the operation being carried too far in the blister steel furnace, and how it does not make cast steel, as cast steel is said to be formed by the fusion of the blister steel in the crucible with charcoal.

‘The usual practice of making cast steel is to fuse common steel in a crucible, without any charcoal being mixed. The degree of hardness required in the cast steel is regulated by selecting blister steel of the proper degree of hardness for what is wanted.

‘This statement is made with the view to correct a common mistake, that to make cast steel it is necessary, and that it is the practice, to mix with the steel to be melted a quantity of charcoal.

‘Pursuing this mistake, it naturally leads to others. Dr. Thomson says, when speaking on this subject, that cast steel is more fusible than

common steel, and for that reason it cannot be welded to iron. It melts before it can be heated high enough; and that the quantity of carbon is greater than in common steel; and that this seems to constitute the difference between the two substances.

'The statement of a simple fact will show that this conclusion is erroneous. Suppose a piece of blister steel, pretty hard, yet fit to stand the operation of welding to iron without any difficulty: let this steel be made into cast steel in the ordinary way. It will not then stand the process of welding. It will not melt before reaching the welding heat; but when brought to that heat, and submitted to the blows of the hammer, it will fall like a piece of sand, and the parts being once separated, they refuse to become again united. This difficulty of working the steel cannot arise from the steel containing more carbon; for the fact is it contains less, part of it being burnt out in the operation of melting it. And, if the same steel was to be melted a second time, more of the carbon would be burnt out; of course the steel would be softer, but at the same time the difficulty of working it would be increased; or, in other words, the red-short property it had acquired in the first melting would be doubly increased in the second, although a person who has not had the experience would very naturally conclude that, as the metal kept retrograding to the state of malleable iron, in the same proportion it would acquire all the properties of the metal in that state. When taking this view of the subject, it would appear that the difference between these two kinds of steel must arise from some other cause than that pointed out by Dr. Thomson.

'When the iron has absorbed a quantity of carbon in the blister steel furnace sufficient to constitute steel of a proper degree of hardness, and the heat after this is continued to be kept up, the steel will keep absorbing more and more carbon. The fusibility of it will continue to increase just in the same proportion, till at last it becomes so fusible that even the limited heat of a blister steel furnace brings it down; and, just at the time it is passing to the fluid state, it takes so great a quantity of charcoal as changes it from the state of steel to that of cast-iron. It appears to me that the charcoal is combined in rich cast-iron, in the mechanical state, and not in the chemical, as in steel.

'With this you will receive a specimen from the blister steel furnace. The fracture of the bar will show you steel in the highest state of combination with carbon in which it can exist; and another part of the same fracture presents the transition from the state of steel to that of cast-iron. Should you require it, I will send you a specimen of cast-steel in the ingot, and, from the same ingot, one in the hammered state.

I am, &c.

'JOHN BUTTERY.'

A new memoir on the alloys of steel has been lately published by Messrs. Stodart and Faraday, of which the following is an abstract. The first curious fact that occurs relates to the compound with silver, of which steel will only retain $\frac{1}{500}$ th

part in union; when more was used, it either evaporated, or separated as the button cooled, or was forced out in forging. The alloy was excellent, and the trifling addition of price furnishes no obstacle to its general employment.

Steel, alloyed with 100th part of platinum, though not so hard as the silver alloy, has more toughness; hence its value where tenacity as well as hardness are required: the extra cost is more than repaid by its excellence. The alloy with rhodium exceeds the former in its valuable qualities, but the scarcity of the metal precludes its general use. To the compounds with iridium and osmium the same remarks apply. The action of acids on these alloys is curious, and especially in respect to that of platinum, which is acted upon by dilute sulphuric acid with infinitely greater rapidity than the unalloyed steel; indeed an acid that scarcely touches the pure steel dissolves the alloy with energetic effervescence. This is no doubt referrible to electrical excitation; and we should apprehend that it would be fatal to the employment of this particular alloy, in any case where chemical action is likely to ensue.

The alloys of steel with gold, tin, copper, and chromium, we have not attempted in the large way. In the laboratory, steel and gold were combined in various proportions; none of the results were so promising as the alloys already named, nor did either tin or copper, as far as we could judge, at all improve steel. With titanium we failed, owing to the imperfection of crucibles. In one instance, in which the fused button gave a fine damask surface, we were disposed to attribute the appearance to the presence of titanium; but in this we were mistaken. The fact was, we had unintentionally made wootz. The button, by analysis, gave a little siliceous alumina, but not an atom of titanium. Menachanite, in a particular state of preparation, was used; this might possibly contain the earths or their basis, or they may have formed a part of the crucible.

Our authors advert to the probable importance of certain triple alloys, only one of which is noticed in their paper, namely, that of steel, iridium, and osmium. 'Some attempts to form other combinations of this description proved encouraging, but we were prevented at the time from bestowing on them that attention and labor they seemed so well to deserve.'

The following is an important and curious paragraph of this paper:—

When pure iron is substituted for steel, the alloys so formed are much less subject to oxidation. Three per cent. of iridium and osmium, fused with some pure iron, gave a button, which, when forged and polished, was exposed with many other pieces of iron, steel, and alloys to a moist atmosphere; it was the last of all in showing any rust. The color of this compound was distinctly blue; it had the property of becoming harder when heated to redness, and quenched in a cold fluid. On observing this steel-like character, we suspected the presence of carbon; none, however, was found, although carefully looked for. It is not improbable that there may be other bodies, besides charcoal, capable of giving to iron the properties of steel;

and though we cannot agree with M. Boussingault, *Annales de Chimie*, xvi. 1, when he would replace carbon in steel by silica, or its base, we think his experiments very interesting on this point, which is worthy of farther examination. In conclusion, our authors observe, that, to succeed in making these compounds, much attention is requisite on the part of the operators; that the purity of the metals is essential; that the perfect and complete fusion of both must be ensured; that they must be kept a considerable time in a state of thin fusion; that, after casting, the forging is with equal care to be attended to; that the metal must on no account be overheated; and that the hardening and tempering must be most carefully performed.

Upon the whole, though we consider these researches upon the alloys of steel as very interesting, we are not sanguine as to their important influence upon the improvement of the manufacture of cutlery, and suspect that a bar of the best ordinary steel, selected with precaution, and most carefully forged, wrought, and tempered, under the immediate inspection of the master, would afford cutting instruments as perfect and excellent as those composed of wootz, or of the alloys.—*Phil. Trans.* 1822.

STEELE (Sir Richard), was born about 1676, in Dublin, in Ireland. One branch of the family was possessed of a considerable estate in the county of Wexford. His father, a barrister at law in Dublin, but of English descent, was private secretary to James duke of Ormond; and his son, while young, being carried to London, he put him to school at the Charter House, whence he was removed to Merton College, Oxford. Our author left the university, without taking any degree, and resolved to enter into the army. This step displeased his friends; but his passion for a military life rendered him deaf to any other proposal. He entered as a private gentleman in the horse guards, and thereby lost the succession to his Irish estate. But as he had a flow of good nature, a generous openness of spirit, and a sparkling vivacity of wit, he became the delight of the soldiery, and obtained an ensign's commission in the guards. In the mean time, as he had chosen a profession which set him free from all ordinary restraints, he indulged in the wildest excesses. Yet his gaieties and revels did not pass without some cool hours of reflection; in these he drew up his treatise entitled *The Christian Hero*, printed in 1701, with a dedication to lord Cutts, who had appointed him his private secretary, and procured for him a company in lord Lucas's regiment of fusileers. The same year he brought out his comedy called *The Funeral, or Grief à la Mode*. This play procured him the regard of king William, who resolved to give him some essential marks of his favor; and though, by that prince's death, his hopes were disappointed, yet, in the beginning of queen Anne's reign, he was appointed gazetteer, by the friendship of lord Halifax and the earl of Sunderland, to whom he had been recommended by his schoolfellow Mr. Addison. That gentleman also assisted him in promoting the comedy called *The Tender Husband*, which was acted in 1704 with great success. But his next

play, *The Lying Lover*, had a very different fate. Upon this rebuff from the stage, he turned his humorous current into another channel; and, early in 1709, began to publish *The Tatler*, in concert with Dr. Swift. His reputation was perfectly established by this work; and, during the course of it, he was made a commissioner of the stamp duties in 1710. Upon the change of the ministry he joined the duke of Marlborough, who had entertained a friendship for him; and, upon his dismissal from all employments in 1711, Mr. Steele addressed a letter of thanks to him for his public services. However, as he still held his place in the stamp office under the new administration, he forbore entering with his pen upon political subjects; but, adhering more closely to Mr. Addison, he dropt the *Tatler*, and afterwards, by the assistance chiefly of that steady friend, he carried on the same plan much improved, under the title of *The Spectator*. The success of this paper was equal to that of the former; which encouraged him, before the close of it, to proceed upon the same design in the character of the *Guardian*. This was opened in the beginning of the year 1713, and was laid down in October the same year. But in the course of it his thoughts took a stronger turn to politics: he engaged with great warmth against the ministry; and, being determined to prosecute his views that way by procuring a seat in the house of commons, he resigned his post in the stamp office; and at the same time gave up a pension, which had been till this time paid him by the queen as a servant to the late prince George of Denmark. He then wrote the famous *Guardian*, upon the demolition of Dunkirk, which was published August 7th, 1713; and, the parliament being dissolved next day, the *Guardian* was soon followed by several other warm political tracts against administration. Upon the meeting of the new parliament, Mr. Steele, having been returned a member for the borough of Stockbridge in Dorsetshire, took his seat accordingly in the house of commons; but was expelled in a few days after, for writing the close of the paper called *The Englishman*, and one of his political pieces entitled *The Crisis*. Presently after his expulsion, he published proposals for writing the history of the duke of Marlborough: he also wrote the *Spinster*; and, in opposition to the *Examiner*, he set up a paper called *The Reader*, and continued publishing in favor of the Whigs till the death of the queen. Immediately after which, as a reward of those services, he was taken into favor by king George I. He was appointed surveyor of the royal stables at Hampton Court, governor of the royal company of comedians, a justice of the peace for Middlesex, and, in 1715, was knighted. In the first parliament of king George he was chosen member for Boroughbridge, in Yorkshire; and, after the suppression of the rebellion in 1715 was appointed one of the commissioners of the forfeited estates in Scotland. In 1718 he buried his second wife, who had brought him a handsome fortune and a good estate in Wales; but neither that, nor the ample additions made to his income, were sufficient to answer his demands. The thoughtless vivacity of his spirit

often reduced him to little shifts for its support; and the project of the fish-pool this year owed its birth chiefly to Sir Richard's necessities. This vessel was intended to carry fish alive from Ireland, and without wasting, to any part of the kingdom; but the scheme proved very ruinous, for after he had been at an immense expense in building his vessel, besides the charge of the patent, the fish, though supplied with a continual stream of water while at sea, yet, uneasy at their confinement, shattered themselves to pieces against the sides of the pool; so that when they were brought to market they were worth very little. In 1719 he opposed the remarkable peerage bill in the house of commons; and for this opposition his license for acting plays was revoked, and his patent rendered ineffectual. On this, finding every direct avenue to his royal master barred against him by the lord chamberlain, he had recourse to the public, in hopes that his complaints would reach the ear of his sovereign by that channel. In this spirit he formed the plan of a periodical paper, to be published twice a-week, under the title of *The Theatre*; the first number of which came out on the 2d of January, 1719-20. During the course of this paper, in which he had assumed the name of Sir John Edgar, he was outrageously attacked by Mr. Dennis, the noted critic, in a very abusive pamphlet, entitled *The Character and Conduct of Sir John Edgar*. To this insult our author made a proper reply in the *Theatre*. While he was struggling to save himself from ruin, he turned his pen against the mischievous South Sea scheme, which had nearly brought the nation to ruin in 1720; and in 1721 he was restored to his office in Drury Lane theatre. Of this it was not long before he made an additional advantage, by bringing his celebrated comedy called *The Conscious Lovers* upon that stage, where it was acted with prodigious success; the receipts must have been very considerable, besides the profits accruing by the sale of the copy, and a purse of £500 given to him by the king, to whom he dedicated it. Yet, notwithstanding these ample supplies, in 1722, being reduced to the utmost extremity, he sold his share in the theatre; and soon after commenced a law-suit with the managers, which in 1726 was decided against him. Having now again brought his fortune, by the most heedless profusion, into a desperate condition, he was rendered altogether incapable of retrieving the loss, by being seized with a paralytic disorder, which greatly impaired his understanding. In these unhappy circumstances, he retired to his seat at Llanganor near Caermarthen, in Wales, where he died the 21st of September, 1729, and was interred in the church of Caermarthen. Among his papers were found the MSS. of two plays, viz. *The Gentlemen*, founded upon the *Eunuch* of Terence, and *The School of Action*, both nearly finished. Sir Richard was a man of undissembled and extensive benevolence, a friend to the friendless, and, as far as his circumstances would permit, the father of every orphan. His works are chaste and manly. He was a stranger to the most distant appearance of envy or malevolence; never jealous of any man's growing reputation; and so

far from arrogating any praise to himself from his conjunction with Mr. Addison, that he was the first who desired him to distinguish his papers. His greatest error was want of economy.

The STEEL-YARD is one of the most ancient presents which science made to society; and, though in comparative desuetude in this country, is in most nations of the world the only instrument for ascertaining the weight of bodies. What is translated balance in the Pentateuch was in fact a steel-yard, being the word used by the Arabs to this day for that instrument. It is in common use in all the Asiatic nations. It was the statera of the Greeks and Romans, and seems to have been more confided in by them than the balance; for which reason it was used by the goldsmiths, while the balance was the instrument of the people.—*Non aurificis statera sed populari trutina examinare.*—*Cic. de Or.* 238. The steel-yard is a lever of unequal arms, and, in its most perfect form, is constructed much like a common balance. It hangs in sheers resting on a nail, and the scale for holding the goods hangs on the short arm. The counter weight hangs by a ring of tempered steel, made sharp inside that it may bear by an edge on the long arm of the steel-yard. The under edge of the centre nail, and the upper edge of that by which the parts hang, are in the straight line formed by the upper edge of the long arm. Thus the three points of suspension are in one straight line. The needle or index of the steel-yard is perpendicular to the line of the arms, and plays between the sheers. The short arm may be made so massive that, together with the scale, it will balance the long arm unloaded. When no goods are in the scale, and the counter weight with its hook are removed, the steel-yard acquires a horizontal position, in consequence of its centre of gravity being below the axis of suspension. The rules for its accurate construction are the same as for a common balance.

The weight in the scale will always be indicated by the division at which it is balanced by the counterpoise. This fundamental property of the lever was discovered by the renowned Archimedes, or at least first demonstrated by him; and his demonstration, besides the defect of being applicable only to commensurable lengths of the arms, has been thought by metaphysicians of the first note to proceed on a postulate which seems equally to need a demonstration. It has accordingly employed the utmost refinement of the first mathematicians of Europe to furnish a demonstration free from objection. M. D'Alembert has given two, remarkable for their ingenuity and subtlety; Foncenex has done the same; and professor Hamilton of Trinity College, Dublin, has given one which is thought the least exceptionable. But critics have even objected to this, as depending on a postulate which should have been demonstrated. In the *Philosophical Transactions*, 1794, there is a demonstration by Mr. Vince, which we think unexceptionable, and of great simplicity. Let *AE* (fig. 1. plate *STEEL-YARD*, &c.) be a mathematical lever, or inflexible straight line, resting on the prop *A*, and supported at *E* by a force acting upwards. Let

two equal weights b and d be hung on at B and D, equidistant from A and E. Pressures are now exerted at A and E; and, because every circumstance of weight and distance is the same, the pressure at E, arising from the action of the weight b on the point B, must be the same with the pressure at A, arising from the action of the weight d on the point D; and the pressure at E, occasioned by the weight d , must be the same with the pressure at A, occasioned by the weight b . This must be the case wherever the weights are hung, provided that the distance AB and DE are equal. Moreover, the sum of the pressures at A and E is unquestionably equal to the sum of the weights, because the weights are supported solely at A and E. Let the two weights be hung on at C the middle point; the pressure at E is still the same. Therefore, in general, the pressure excited at the point E, by two equal weights hanging at any points B and D, is the same as if they were hung on at the middle point between them; but the pressure excited at E is a just measure of the effort or energy of the weight b and d to urge the lever round the point A. It is, at least, a measure of the opposite force which must be applied at E to sustain or balance this pressure. A very fastidious metaphysician may still say that the demonstration is limited to a point E, whose distance from A is twice AC, or $= AB + AD$. But it extends to any other point, on the authority of a postulate which cannot be refused, viz. that in whatever proportion the pressure at E is augmented or diminished, the pressure at this other point must augment or diminish in the same proportion. This being proved, the general theorem may be demonstrated in all proportions of distance, in the manner of Archimedes, at once the most simple, perspicuous, and elegant of all. All this difficulty (and it is a real one to the philosopher who aims at rendering mechanics a demonstrative science) has arisen from an improper search after simplicity. Had Archimedes taken a lever as it really exists in nature, and considered it as material, consisting of atoms united by cohesion; and had he traced the intermediate pressures by whose means the two external weights are put in opposition to each other, or rather to the support given to the fulcrum; all difficulty would have vanished. The quantity of goods which may be weighed by this instrument depends on the weight of the counterpoise, and on the distance CD from the fulcrum at which the goods are suspended. A double counterpoise hanging at the same division will balance or indicate a double quantity of goods hanging at D; and any counterpoise will balance and indicate a double quantity of goods, if the distance CD be reduced to one-half.

Many steelyards have two or more points of suspension D, to which the scale may be occasionally attached. See BALANCE. It is evident that in this case the valve or indication of the divisions of the long arm will be different, according to the point from which the scale is suspended. The same division which would indicate twenty pounds when CD is three inches, will indicate thirty pounds when it is two inches. As it would expose to chance of mistakes, and

be otherwise troublesome to make as many divided scales on the long arm as there are points of suspension, D, on the short arm; and each scale having its own numbers; all trouble and all chance of mistake is avoided. But the range of this instrument is not altogether at the pleasure of the maker. Besides the inability of a slender beam to carry a great load, the divisions of the scale answering to pounds or half pounds become very minute when the distance CD is very short: and the balance becomes less delicate, that is, less sensibly affected by small differences of weight. This is because in such cases the thickness which it is necessary to give the edges of the nails does then bear a sensible proportion to the distance CD between them; so that when the balance inclines to one side, that arm is sensibly shortened, and therefore the energy of the preponderating weight is lessened. We have hitherto supposed the steelyard to be in equilibrio when not loaded. But this is not necessary, nor is it usual in those which are commonly made. The long arm preponderates considerably. This makes no difference except in the beginning of the scale. The preponderancy of the long arm is equivalent to some goods already in the scale, suppose four pounds. Therefore, when there are really ten pounds in the scale, the counterpoise will balance it when hanging at the division 6. This division is therefore reckoned ten, and the rest of the divisions are numbered accordingly. A scientific examination of the steelyard will convince us that it is inferior to the balance of equal arms in point of sensibility; but it is extremely compendious and convenient; and, when accurately made and attentively used, it is abundantly exact for most commercial purposes. There is one at Leipsic which has been in use since the year 1718, which is very sensible to a difference of one pound, when loaded with nearly three tons on the short arm; and we saw a waggon loaded with more than two tons weighed by it in about six minutes. The steelyard in common use in the different countries of Europe is of a construction still simpler than the one above described. It consists of a batten of hard wood, having a heavy lump A (fig. 2) at one end, and a swivel hook B at the other. The goods to be weighed are suspended on tac hook, and the whole is carried in a loop of whip-cord C, in which it is slid backward and forward till the goods are balanced by the weight of the other end. The weight of the goods is estimated by the place of the loop on a scale of divisions in harmonic progression. They are marked (we presume) by trial with known weights. The chief use that is now made of the steelyard in these kingdoms is for the weighing of loaded waggons and carts. For this it is extremely convenient, and sufficiently exact for the purpose in view.

STEEL-YARD OF LEIPSIC: this is represented in fig. 3 as run out, and just about to be hooked for lifting up the load. The steelyard itself is OPQ, and is about twelve feet long. The short arm PQ has two points of suspension, c and b; and the stirrup which carries the chains for holding the load is made with a double hook,

instead of a double eye, that it may be easily removed from the one pin to the other. For this purpose the two hooks are connected above by a hasp or staple, which goes over the arm of the steelyard like an arch. This is represented in the little figure above the steelyard. The suspension is shifted when the steelyard is run in under cover, by hooking to this staple the running block of a small tackle which hangs in the door through which the steelyard is run out and in. This operation is easy, but necessary, because the stirrup, chains, and the stage on which the load is placed, weigh some hundreds. The outer pin *b* is fourteen inches, and the inner one *c* is seven inches, distant from the great nail which rests in the sheers. The other arm is about ten feet and a half long, formed with an obtuse edge above. On the inclined plane on each side of the ridge is drawn the scale of weights adapted to the inner pin *c*. The scales corresponding to the outer pin *b* are drawn on the upright sides. The counterpoise slides along this arm, hanging from a saddle-piece made of brass, that it may not contract rust. The motion is made easy by means of rollers. This is necessary, because the counterpoise is greatly above a hundred weight. This saddle-piece has like two laps on each side, on which are engraved vernier scales, which divide their respective scales on the arm to quarters of a pound. Above the saddle is an arch, from the summit of which hangs a little plummet, which shows the equilibrium of the steelyard to the weigher, because the sheers are four feet out of the house, and he cannot see their coincidence with the needle of the steelyard. Lastly, near the end of the long arm are two pins, *d* and *e*, for suspending occasionally two eke-weights for continuing the scale. These are kept hanging on adjoining hooks, ready to be lifted on by a little tackle, which is also hooked immediately above the pins *d* and *e*. The scales of weights are laid down on the arm as follows:—Let the eke-weights appropriated to the pins *d* and *e* be called *D* and *E*, and call the counterpoise *C*. Although the stirrup with its chains and stage weigh some hundreds, yet the length and size of the arm *OP* gives it a preponderancy of 300 pounds. Here, then, the scale of weights must commence. The counterpoise weighs about 125 pounds. Therefore, 1. When the load hangs by the pin *b*, fourteen inches from the centre, the distance from one hundred to another on the scale is about eleven inches, and the first scale (on the side of the arm) reaches from 300 to 1200. In order to repeat or continue this, the eke-weight *E* is hung on the pin *e*, and the counterpoise *C* is brought back to the mark 300; and the two together balance 1100 pounds hanging at *b*. Therefore a second scale is begun on the side of the arm, and continued as far out as the first, and therefore its extremity marks 2000; that is, the counterpoise *C* at 2000, and the eke-weight *E* at *e* balance 2000 hanging at *b*. 2. To continue the scale beyond 2000, the load must be hung on the inner pin *c*. The eke-weight *E* is taken off, and the eke-weight *D* is hung on its pin *d*. The general counterpoise being now brought close to the sheers, it, together with the

weight *D* at *d*, balances 2000 pounds hanging at *c*. A scale is therefore begun on one of the inclined planes *a-top*, and continued out to 4000, which falls very near to the pin *d*, each hundred pounds occupying about five inches on the arm. To complete the scale hang the eke-weight *E* on its pin *e*, and bring back the counterpoise to the sheers, and the three together balance 3800 hanging at *c*. Therefore, when the counterpoise is now slid out to 4000, it must complete the balance with 5800 hanging at *c*. It required a little consideration to find out what proportion of the three weights *C*, *D*, and *E*, would make the repetitions of the scale extend as far as possible, having very little of it expressed twice, or upon two scales, as is the case here. We see that the space corresponding to a single pound is a very sensible quantity on both scales, being one-ninth of an inch on the first two scales, and one-twentieth on the last two. This very ponderous machine, with its massy weights, cannot be easily managed without some assistance from mechanics. It is extremely proper to have it susceptible of motion out and in, that it may be protected from the weather, which would soon destroy it by rust. The contrivance here is very effectual, and abundantly simple. When the steelyard is not in use, it is supported at one end by the iron rod *F*, into which the upper end of the sheers is hooked. The upper end of this rod has a strong hook *E*, and a little below at *a* it is pierced with a hole, in which is a very strong bolt or pin of tempered steel, having a roller on each end close to the rod on each side. These rollers rest on two joists, one of which is represented by *MN*, which traverse the building, with just room enough between them to allow the rod *F* to hang freely down. The other end *O* of the steelyard rests in the bight of a large flat hook at the end of a chain *W*, which hangs down between the joists, and is supported on them by a frame with rollers *H*. This is connected with the rollers at *G*, which carry the sheers by means of two iron rods, of which one only can be seen. These connect the two sets of rollers in such a manner that they must always move together, and keep their distance invariable. This motion is produced by means of an endless rope *HIZLKVH* passing over the pulleys *I* and *K*, which turn between the joists, and hanging down in a bight between them. It is evident that by pulling on the part *LZ* we pull the frame of rollers in the direction *GH*, and thus bring the whole into the house in the position marked by the dotted figure. It is also plain that by pulling on the part *LK* we force the roller frame and the whole apparatus out again. It remains to show how the load is raised from the ground and weighed. When the steelyard is run out for use, the upper hook *E* just enters into the ring *D*, which hangs from the end of the great oaken lever *BCA* about twenty-two feet long, turning on gudgeons at *C* about five feet from this end. From the other end *A* descends a long iron rod *SR*, which has one side formed into a toothed rack that is acted on by a frame of wheel work turned by an endless screw and winch *Q*. Therefore, when the hook *E* is well engaged in the ring *D*, a man

turns the winch, and thus brings down the end A of the great lever, and raises the load two or three inches from the ground. Every thing is now at liberty, and the weigher now manages his weights on the arm of the steelyard till he has made an equilibrium. The operation of letting down the load, disengaging the steelyard from the great lever, and bringing it under cover, is performed by two men, and may be done in succession by one, and is over in five or six minutes.

The most compendious and economical machine of this kind is one, first used (we have heard) for weighing the riders of race horses, and afterwards applied to the more reputable service of weighing loaded carriages. Fig. 4 is a plan of the machine; K L M N is the plan of a rectangular box, which has a platform lid or cover, of size sufficient for placing the wheels of a cart or waggon. The box is about a foot deep, and is sunk into the ground till the platform cover is even with the surface. In the middle of the box is an iron lever supported on the fulcrum pin $i k$, formed like the nail of balance, which rests with its edge on arches of hardened steel, firmly fastened to the bottom of the box. This lever goes through one side of the box, and is furnished at its extremity with a hard steel pin $l m$, also formed to an edge below. In the very middle of the box it is crossed by a third nail of hardened steel $g h$, also formed to an edge, but on the upper side. These three edges are in one horizontal plane, as in a well made balance. In the four corners A, A', E', E, of the box are firmly fixed four blocks of tempered steel, having their upper surfaces formed into spherical cavities, well polished and hard tempered. A B C D E represents the upper edge of an iron bar of considerable strength, which rests on the cavities of the steel blocks in A and E, by means of two hard steel studs projecting from its under edge, and formed into obtuse angled points or cones. These points are in a straight line parallel to the side K N of the box. The middle part C of this crooked bar is faced with hard tempered steel below, and is there formed into an edge parallel to A E and K N, by which it rests on the upper edge of the steel pin $g h$ which is in the lever. In a line parallel to A E, and on the upper side of the crooked bar A C E, are fixed two studs or points of hardened steel B and D, projecting upwards above half an inch. The platform cover has four short feet like a stool, terminated by hard steel studs, which are shaped into spherical cavities and well polished. With these it rests on the four steel points B, B', D', D. The bar A C E is kned in such a manner vertically, that the points A, B, D, E, and the edge C, are all in a horizontal plane.

These particulars will be better understood by looking at the elevation in fig. 5. What has been said of the bar A C E, must be understood as also said of the bar A' C' E. Draw through the centre of the box the line $a b c$ perpendicular to the line A E, B D. It is evident that the bar A C E is equivalent to a lever $a b c$, having the fulcrum or axis A E resting with its extremity C on the pin $h g$, and loaded at b . It is also evi-

dent that $a C$ is to $a b$ as the load on this lever to the pressure which it exerts on the pin $g h$, and that the same proportion subsists between the whole load on the platform and the pressure which it exerts on the pin $g h$. It will also appear, on an attentive consideration, that this proportion is no-wise deranged in whatever manner the load is placed on the platform. If very unequally, the two ends of the pin $g h$ may be unequally pressed, and the lever wrenched and strained a little; but the total pressure is not changed. If there be now placed a balance or steelyard at the side L K, in such a manner that one end of it may be directly above the pin $l m$ in the end of the lever E O F, they may be connected by a wire or slender rod, and a weight on the other arm of the balance or steelyard may be put in equilibrio with any load that can be laid on the platform. A small counterpoise being first hung on, to balance the apparatus when unloaded, any additional weight will measure the load really laid on the platform. If $a b$ be to $a c$ as one to eight, and E O to E F also as one to eight, and if a common balance be used above, sixty-four pounds on the platform will be balanced by one pound in the scale, and every pound will be balanced by a quarter of an ounce. This would be a very convenient partition for most purposes, as it would enable us to use a common balance and common weights to complete the machine; or it may be made with a balance of unequal arms, or with a steelyard. Some have thought to improve this instrument by using edges like those of the nails of a balance, instead of points. But, unless made with uncommon accuracy, they will render the balance very dull. The small deviation of the two edges A and E, or of B and D, from perfect parallelism to K N, is equivalent to a broad surface equal to the whole deviation. Without extraordinary care, the machine may be made to weigh within $\frac{1}{3000}$ th part of the truth, which is exact enough for any purpose in commerce. It is necessary that the points be attached to the bars. Some have put the points at A and E in the blocks of steel fastened to the bottom, because the cavity there lodged water or dirt, which soon destroyed the instrument with rust. But this occasions a change of proportion in the first lever by any shifting of the crooked bars; and this will frequently happen when the wheels of a loaded cart are pushed on the platform. The cavity in the steel stud should have a little rim round it, and it should be kept full of oil. In a nice machine a quarter of an inch of quicksilver would effectually prevent all these inconveniences. The simplest and most economical form of this machine is to have no balance or second steelyard; but to make the first steelyard E O F a lever of the first kind, viz. having the fulcrum between O and F, and allow it to project far beyond the box. The long or outward arm of this lever is then divided into a scale of weights, commencing at the side of the box. A counterpoise must be chosen, such as will, when at the beginning of the scale, balance the smallest load that will probably be examined. It will be convenient to carry on this scale by means of eke-weights hung on at the extremity of the lever,

and to use but one moveable weight. By this method the divisions of the scale will have always one value. The best arrangement is as follows: Place the mark O at the beginning of the scale, and let it extend only to 100, if for pounds; or to 112, if for cwts.; or to ten, if for stones; and let the eke-weights be numbered one, two, three, &c. Let the lowest weight be marked on the beam. This is always to be added to the weight shown by the operation. Let the eke-weights stand at the end of the beam, and let the general counterpoise always hang at O. When the cart is put on the platform, the end of the beam tilts up. Hang on the heaviest eke-weight that is not sufficient to press it down. Now, complete the balance by sliding out the counterpoise. Suppose the constant load to be 312 lbs., and that the counterpoise stands at eighty-six, and that the eke-weight is nine; we have the load = 986 + 312 = 1298 lbs.

STEEN (John), an eminent Dutch painter, born at Leyden in 1636. He was the disciple of Brower and Van Goyen. He painted conversations and droll subjects with admirable humour; and died in 1689.

STEEP, *adj.* & *n. s.* } Sax. *ƿreap*. Rising
STEEP'NESS, *n. s.* } or descending with a
STEEP'Y, *adj.* } great inclination; precipitous: a precipice: steepness is precipitous declivity: steepy, having much declivity.

The mountains shall be thrown down, and the steep places shall fall. *Ezekiel.*

The craggedness or steepness of that mountain maketh many parts of it inaccessible.

Brerewood on Language.

Lord Lovel swam over Trent on horseback, but could not recover the farther side, by reason of the steepness of the bank, and so was drowned.

Bacon's Henry VII.

Who hath disposed, but thou the winding way,
Where springs down from the steepy crags do beat? *Wotton.*

As that Thebean monster that proposed
Her riddle, and him, who solved it not, devoured;
That once found out and solved, for grief and spight
Cast herself headlong from the Ismenian steep. *Milton.*

A prophet some, and some a poet cry,
From steepy Othrys' top to Pylus drove
His herd! and for his pains enjoyed his love. *Dryden.*

No more, my goats, shall I behold you climb
The steepy cliffs, or crop the flowery thyme. *Id.*

As high turrets for their airy steep
Require foundations in proportion deep:
And lofty cedars as far upward shoot
As to the nether heavens they drive the root;
So low did her secure foundation lie,
She was not humble, but humility. *Id.*

He now had conquered Anxur's steep ascent.

Addison.

We had on each side naked rocks and mountains,
broken into a thousand irregular steeps and precipices. *Id.*

Vineyards, meadows, and cornfields lie on the borders, and run up all the sides of the Alps, where the barrenness of the rocks, or the steepness of the ascent, will suffer them. *Id.*

Leaning o'er the rails, he musing stood,
And viewed below the black canal of mud,
Where common shores a lulling murmur keep,
Whose torrents rush from Holborn's fatal steep. *Gay.*

STEEP, *v. a.* Belg. *steppen*. To soak; macerate; imbue; dip.

When his brother saw the red blood trail
Adown so fast, and all his armour steep,
For very fellness loud he 'gan to weep. *Spenser.*

He, like an adder lurking in the weeds,
His wandering thought in deep desire does steep;
And his frail eye with spoil of beauty feeds. *Id.*

A napkin steeped in the harmless blood
Of sweet young Rutland. *Shakspeare. Henry VI.*

The conquering wine hath steeped our sense
In soft and delicate Lethe. *Shakspeare.*

Most of the steepings are cheap things, and the goodness of the crop is a great matter of gain. *Bacon.*

Whole droves of minds are by the driving god
Compelled to drink the deep Lethean flood;
In large forgetful draughts to steep the cares
Of their past labours and their irksome years. *Dryden.*

Wheat steeped in brine twelve hours prevents the smuttiness. *Mortimer's Husbandry.*

STEEPHOLMES, a rocky islet of England, in the Bristol Channel, under Quantock hills, which divides the counties of Somerset, Gloucester, and Bristol. It is a rock, about a mile and a half in circumference, in many parts overhanging the water, and inaccessible except by two very steep passages. A few rabbits find subsistence upon it; and it is the resort of vast numbers of sea-fowl.

STEEPLE, *n. s.* Sax. *ƿreopel*, *ƿrypel*, of Sax. *ƿreap*. A turret of a church; a spire.

Blow, winds, and crack your cheeks; rage blow!
You cataracts and hurricanoes, spout!
Till you have drenched our steeples, drowned the cocks. *Shakspeare.*

What was found in many places, and preached for wheat fallen on the ground from the clouds, was but the seed of ivy berries; and though found in steeples or high places, might be conveyed thither or muted by birds. *Brown's Vulgar Errors.*

They, far from steeples and their sacred sound,
In fields their sullen conventicles found. *Dryden.*

A raven I saw steeple-high, just over your house. *L'Estrange.*

STEER, *n. s.* Sax. *ƿryne*, *ƿreor*, *ƿriore*; Belg. *stier*. A young bullock.

They think themselves half exempted from law and obedience; and, having once tasted freedom, do, like a steer that hath been long out of his yoke, grudge and repine ever after to come under rule again. *Spenser's Ireland.*

Lacaon, Neptune's priest,
With solemn pomp then sacrificed a steer. *Dryden.*

Nor has the steer,
At whose strong chest the deadly tiger hangs,
E'er plowed for him. *Thomson.*

STEER, *v. a.* & *v. n.* } Sax. *ƿreopan*, *ƿryan*;
STEER'AGE, *n. s.* } Belg. *stieren*. To direct;
STEER'S MATE, } guide in a passage; originally used of a ship,
STEER'S MAN, } but applied to other things: the noun substantives corresponding.

A comely palmer, clad in black attire,
Of ripest years, and hairs all hoary gray,
That with a staff his feeble steps did steer,
Lest his long way his aged limbs should tire. *Spenser.*

He that hath the steerage of my course,
Direct my suit. *Shakspeare. Romeo and Juliet.*

If a pilot cannot see the pole star, it can be no fault in him to *steer* his course by such stars as do best appear to him.

King Charles.

As when a ship, by skillful *steersman* wrought, Nigh river's mouth, or foreland, where the wind Veers oft, as oft so *steers*, and shifts her sail.

Milton.

What pilot so expert but needs must wreck, Embarked with such a *steersmate* at the helm? *Id.*

His costly frame

Inscribed to Phœbus, here he hung on high, The *steerage* of his wings and cut the sky. *Dryden.*

Through it the joyful *steersman* clears his way, And comes to anchor in his inmost bay. *Id.*

In a storm, though the vessel be pressed never so hard, a skilful *steersman* will yet bear up against it.

L'Estrange.

In a creature, whose thoughts are more than the sands and wider than the ocean, fancy and passion must needs run him into strange courses, if reason, which is his only star and compass, be not that he *steer*. by.

Locke.

Having got his vessel launched and set afloat, he committed the *steerage* of it to such as he thought capable of conducting it.

Spectator.

You raise the honour of the peerage, Proud to attend you at the *steerage*.

Swift.

STEERAGE, on board a ship is that part of the ship next below the quarter-deck, before the bulk head of the great cabin where the steersman stands in most ships of war. See **STEERING**.

STEERING, in navigation, the art of directing the ship's way by the movements of the helm; or of applying its efforts to regulate her course when she advances. The perfection of steering consists in a vigilant attention to the motion of the ship's head, so as to check every deviation from the line of her course in the first instant of its motion, and in applying as little of the power of the helm as possible. By this she will run more uniformly in a straight path, as declining less to the right and left; whereas, if a greater effort of the helm is employed, it will produce a greater declination from the course, and not only increase the difficulty of steering, but also make a crooked and irregular tract through the water. See **HELM**. The helmsman should diligently watch the movements of the head by the land, clouds, moon, or stars; because, although the course is in general regulated by the compass, yet the vibrations of the needle are not so quickly perceived as the sallies of the ship's head to the right or left; which, if not immediately restrained, will acquire additional velocity in every instant of their motion, and demand a more powerful impulse of the helm to reduce them; the application of which will operate to turn her head as far on the contrary side of her course. The phrases used in steering a ship vary according to the relation of the wind to her course. Thus, if the wind is fair or large, the phrases used by the pilot or officer who superintends the *steerage* are, port, star-board, and steady. The first is intended to direct the ship's course farther to the right; the second is to guide her farther to the left; and the last is designed to keep her exactly in the line whereon she advances according to the course prescribed. The excess of the first and second movement is called hard a-port, and hard-a-star-board; the former of which gives her the greatest

possible inclination to the right, and the latter an equal tendency to the left. If, on the other hand, the wind is foul or scant, the phrases are luff, thus, and no nearer: the first of which is the order to keep her close to the wind; the second, to retain her in her present situation; and the third, to keep her sails full. In a ship of war, the exercise of steering the ship is usually divided among a number of the most expert sailors, who attend the helm in their turns; and are accordingly called timoneers, from the French timonier, which signifies helmsman. The *steerage* is constantly supervised by the quarter-masters, who also attend the helm by rotation. In merchant ships every seaman takes his turn in this service, being directed therein by the mate of the watch, or some other officer.—As the safety of a ship, and all contained therein, depends in a great measure on the *steerage* or effects of the helm, the apparatus by which it is managed should often be diligently examined by the proper officers. Indeed, a negligence in this important duty appears almost unpardonable, when the fatal effects which may result from it are duly considered.

STEEVENS (George), one of the most successful of the editors and commentators of Shakspeare, was born in 1735. His parents were in affluent circumstances. George received the rudiments of his education at Kingston-upon-Thames, under the tuition of Dr. Woodeson and his assistants; and had for a companion at that school Gibbon the historian. From Kingston he went to Eton, whence, after some years, he was admitted a fellow-commoner of King's College, Cambridge. After he left the university, he accepted a commission in the Essex militia on its first establishment; and he spent the latter years of his life at Hampstead in almost total seclusion from the world; seldom mixing with society but in the shops of booksellers, in the Shakspeare Gallery, or in the morning conversations of Sir Joseph Banks. He died January 1800. Mr. Steevens was a classical scholar of the first order. He was equally acquainted with the belles lettres of Europe. He had studied history, ancient and modern, but particularly that of his own country. He possessed a strong original genius, and an abundant wit; his imagination was of every color, and his sentiments were enlivened with the most brilliant expressions. Mr. Steevens also had a very handsome fortune; and his generosity was equal to it.

STEFANESCHI (John Baptist), an historical painter, born at Florence in 1582. He was much esteemed and patronised by Ferdinand II. duke of Tuscany, for whom he painted several sacred subjects in miniature. He died in 1659.

STEFANO (J.), an eminent Italian painter, born at Florence in 1301, and hence called Florentino. He was the disciple of Giotto, and became superior to all his contemporaries except his master. One of his best pictures is of Christ delivering the demoniac. He died in 1650, aged forty-nine.

STELLA (Lat. i. e. a star), a name given by dean Swift to Mrs. Johnson, an amiable lady, whom he long loved, and at last married; but, as he never publicly acknowledged her to be his

wife, nor cohabited with her as such, the disappointment broke her heart. The most plausible reason ever assigned for his strange conduct in this affair, is that he had discovered that she was his sister. But this is no longer believed. See SWIFT.

STELLA (James), a celebrated French painter, born at Lyons in 1596. He studied painting early, and at twenty went to Rome. In passing through Florence, Cosmo de Medicis, the great duke, employed him, gave him lodgings, and a pension. He afterwards went to Paris, where he was patronised by Louis XIII., who gave him a good pension, lodgings in the Louvre, and honored him with the order of St. Michael. He died in 1647.

STELLA (Francis), brother and disciple of James, was born at Lyons in 1601, and travelled with his brother into Italy; but, though a good painter, he never equalled James. He died in 1661.

STEL'LAR, *adj.* } Lat. *stella*. Relating to
STEL'RATE, } the stars: pointed in the
STEL'LED. } manner of a star.

And quenched the stelled fires.

Shakspeare. King Lear.

In part shed down

Their stellar virtue, on all things that grow
On earth; made hereby apter to receive

Perfection from the sun's more potent ray. *Milton.*

Salt dissolved, upon fixation, returns to its affected cubes, and regular figures of minerals; as the hexagonal of chrysal, and stellar figure of the stone astra.

Glanville.

One making a regulus of antimony, without iron, found his regulus adorned with a more conspicuous star than I have seen in several stellate reguluses of antimony and mars.

Boyle.

STELLARIA, stitchwort, or great chickweed, in botany, a genus of plants belonging to the class decandria, and order trigynia; natural order twenty-second, caryophyllæ: CAL. pentaphyllous and spreading. There are five petals, each divided into two segments: CAPS. oval, unilocular, and polyspermous. There are nine species, viz. 1. *S. arenaria*; 2. *Biflora*; 3. *Cerastoides*; 4. *Dichotoma*; 5. *Graminea*; 6. *Holostea*; 7. *Nemorum*; 8. *Radians*; and, 9. *Undulata*. Of these three are natives of Britain: viz. 1. *S. graminea*, less stitchwort. The stem is nearly a foot high. The leaves are linear and entire; and the flowers grow in loose panicles. It is frequent in dry pastures. There is a variety of this species called bog stitchwort, with smooth, oval, sessile leaves, and few leaves, which grows often in wet marshy places. The stalk is quadrangular; the petals scarcely longer than the calyx, and bifid to the base.

2. *S. holostea*, greater stitchwort. The stalks are about two feet long; the petals are nearly twice the length of the calyx, and divided half-way to the base. It is common in woods and hedges.

3. *S. nemorum*, broad-leaved stitchwort. The stalks are about twelve or eighteen inches high, and branched in a panicle at the top. The leaves are heart-shaped, and of a paler green on the under than on the upper side; the lower ones being supported by foot-stalks which are hairy and channelled; the upper ones are sessile. The

calyx is erect, somewhat hairy, and white on the margins. The petals are bifid almost to the base. There is a small nectarium between the lower stamina and the calyx.

STELLATE, among botanists, expresses leaves which grow not less than six at a joint, and are arranged like the rays of a star.

STELLENBOSCH AND DRAKENSTEIN, an extensive district of the settlement of the Cape of Good Hope. They include from Cape Agulhas, the southernmost point of Africa, to the river Koussie, the northern boundary of the colony. The district is 380 miles long, about 150 broad, and may contain an area of 55,000 square miles. The greater part consists of mountains, sandy hills, and Karroo plains, but the remainder is the finest land in the colony. About 39,146 English acres are under cultivation. See CAPE OF GOOD HOPE.

STELLENBOSCH, a town delightfully situated twenty-six miles to the east of Cape Town, Cape of Good Hope, at the foot of a range of lofty mountains, near the Cape.

STELLERA, German groundsel, in botany a genus of the monogynia order, and octandria class of plants; natural order thirty-first, vepriculæ: CAL. none: COR. quadriid; the stamina are very short. There is only one seed, which is black. The species are only two:—1. *S. chamaejasme*, and 2. *S. passerina*.

STELLIONATE, *n. s.* Fr. *stellonat*; Lat. *stellionatus*. A kind of crime which is committed (in law) by a deceitful selling of a thing otherwise than it really is: as, if a man should sell that for his own estate which is actually another man's.

It discerneth of crimes of stellionate, and the inchoations towards crimes capital, not actually committed.

Bacon.

STEM, *n. s.* Latin *stemma*. Stalk; twig: hence family; race; pedigree; progeny: also the fore part of a ship.

Two lovely berries molded on one stem,
So with two seeming bodies, but one heart.

Shakspeare.

This is a stem
Of that victorious stock, and let us fear
His native mightiness.

Id. Henry V.

After they are first shot up thirty foot in length, they spread a very large top, having no bough nor twig in the trunk or stem.

Raleigh's History.

Set them aslope a reasonable depth, and then they will put forth many roots, and so carry more shoots upon a stem.

Bacon.

Whosoever will undertake the imperial diadem, must have of his own wherewith to support it; which is one of the reasons that it hath continued these two ages and more in that stem, now so much spoken of.

Howel's Vocal Forest.

This, ere it was in th' earth,
God made, and ev'ry herb before it grew
On the green stem.

Milton.

I will assay her worth to celebrate;
And so attend ye toward her glittering state,
Where ye may all, that are of noble stem,
Approach.

Id.

The stem thus threatened and the sap in thee,
Drops all the branches of that noble tree.

Waller.

Farewell you flowers, whose buds with early care
I watched, and to the cheerful sun did rear.

Who now shall bind your *stems*? or, when you fall,
With fountain streams your fainting souls recall?

Id.

The lowering spring with lavish rain
Beats down the slender *stem* and bearded grain. *Id.*
Orante's barque, ev'n in the hero's view,
From *stem* to stern by waves was overborn. *Id.*
Dost thou in hounds aspire to deathless fame?
Learn well their lineage and their ancient *stem*.

Tickell.

STEM, *v. a.* Isl. *slamma*. To oppose a current; pass cross or forward notwithstanding the stream.

Above the deep they raise their scaly crests,
And *stem* the flood with their erected breasts.

Denham.

They on the trading flood,
Through the wide Ethiopian to the cape,
Ply, *stemming* nightly toward the pole. *Milton.*

In shipping such as this, the Irish kern
And untaught Indian on the stream did glide,
Ere sharp-keeled boats to *stem* the flood did learn,
Or fin-like oars did spread from either side.

Dryden.

At length Erasmus, that great injured name,
Stemmed the wild torrent of a barb'rous age,
And drove those holy Vandals off the stage. *Pope.*

STEM, in botany, is that part of a plant arising out of the root, and which sustains the leaves, flowers, fruits, &c. By washing and rubbing the stems of trees their annual increase is promoted; for the method of doing which see TREE.

STEM OF A SHIP, a circular piece of timber into which the two sides of a ship are united at the fore-end; the lower end of it is scarfed to the keel, and the bowsprit rests upon its upper end. The stem is formed of one or two pieces, according to the size of the vessel; and, as it terminates the ship forward, the ends of the wales and plank of the sides and bottom are let into a groove or channel, in the midst of its surface, from the top to the bottom; which operation is called rabbeting. The outside of the stem is usually marked with a scale or division of feet, according to its perpendicular height from the keel. The intention of this is to ascertain the draught of water at the fore part when the ship is in preparation for a sea-voyage, &c. The stem at its lower end is of equal breadth and thickness with the keel, but it grows proportionally broader and thicker towards its upper extremity. See SHIP BUILDING.

STEMMATA, in entomology, are three smooth hemispheric dots placed generally on the top of the head, as in most of the hymenoptera and other classes. The name was first introduced by Linnæus.

STEMODIA, in botany, a genus of the angiospermia order, and didynamia class of plants; natural order fortieth, personatæ: CAL. quinquepartite: COR. bilabiated; there are four stamina; each of the filaments are bifid, and have two anthers: CAPS. bilocular. There is only one species, *S. maritima*.

STEMPHYLA, a word used by the ancients to express the husks of grapes, or the remains of the pressings of wine. The same word is also used by some to express the remaining mass of the olives after the oil is pressed out.

STEMPHYLITES, a name given by the

ancients to a sort of wine pressed hard from the husks.

STEMPLES, in mining, cross bars of wood in the shafts which are sunk to mines. In many places the method is to sink a perpendicular hole or shaft, the sides of which they strengthen from top to bottom with wood-work, to prevent the earth from falling in: the transverse pieces of wood used for this purpose are called stemples, and by means of these the miners in some places descend without using any rope, catching hold of these with their hands and feet.

STEMSON, in a ship, an arching piece of timber fixed within the apron, to reinforce the scarf thereof, in the same manner as the scarf supports the scarf of the stern. In large ships it is usually formed of two pieces.

STENCH, *n. s. & v. a.* Sax. *stencan*, a stink. A stink or bad smell: to make to stink. Not proper. Used corruptly, for to staunch; stop.

So bee's with smoke, and doves with noisome
stench,
Are from their hives and houses driven away.

Shakspeare.

Physicians, by the *stench* of feathers, cure the rising of the mother. *Bacon's Natural History.*

Black bulls and bearded goats on altars lie,
And clouds of savory *stench* involve the sky. *Dryden.*

The ministry will be found the salt of the earth,
The thing that keeps societies of men from *stench* and corruption.

South.

The foulness of the ponds only *stencheth* the water.

Mortimer.

The hoary Nar

Corrupted with the *stench* of sulphur flows,
And into Tiber's streams th' infected current throws.

Addison.

They had better skill to let blood than *stench* it.

King Charles.

Restringents to *stench* and incrusatives to thicken the blood.

Harvey on Consumptions.

STENDAL, or STENDEL, a town of the Prussian states, the former capital of the Old Mark of Brandenburg, but now included in the government of Magdeburg. It is situated in a plain on the Ucht, and is of considerable size. Here is a colony of French Calvinists, who carry on woollen and other manufactures, established by their ancestors. The town is old, and suffered greatly from fire in 1575, 1680, and 1687. Winckelmann was a native of this place. Inhabitants 5000. Thirty-one miles N. N. W. of Brandenburg, and sixty-two west of Berlin.

STENNET (Samuel), D. D., a Baptist clergyman, pastor of a congregation in Little Wild Street, London, was born in 1727, and died August 22d, 1795, at his residence at Muswell-hill near Highgate. He was a man much respected among the Protestant dissenters, both for the excellence of his character and for his learning and ability. Besides some single sermons, he was the author of Discourses on Personal Religion, 2 vols. 12mo.; Discourses on Domestic Duties, 8vo.; Sermons on the Divine Authority and various Use of the Holy Scriptures, 1790, 8vo. He also carried on a controversy on the subject of baptism with Dr. Stephen Addington.

STENO (Nicolas), a celebrated Danish anatomist, born in 1638. He studied under Bartholin, with whom he was a favorite. He then

travelled through France, Germany, Holland, and Italy; and obtained a pension from Ferdinand II., grand duke of Tuscany. In 1669 he renounced the Protestant religion, became a popish priest, and was appointed by the pope his apostolical vicar for the north. He published several tracts on anatomy and medical subjects.

He died in 1603.

STENO STURZ, a celebrated Swedish patriot. See SWEDEN.

STENOGRAPHIC, or STENOGRAPHICAL, (from stenography). Of or belonging to stenography, or writing in short-hand.

STENOGRAPHER, a short-hand writer.

STENOGRAPHY.

STENOGRAPHY, *n. s.* Gr. στενος and γραφω. Short-hand. See below.

O the accurst stenography of state!
The princely eagle shrunk into a bat. *Cleveland.*

SECT. I.—BRIEF HISTORY AND GENERAL SKETCH OF THE ART.

STENOGRAPHY. The art of stenography, or short-hand writing, was known and practised by several ancient nations. The Egyptians, who were distinguished for learning at an early period, at first expressed their words by a delineation of figures called hieroglyphics: a more concise mode of writing seems to have been afterwards introduced, in which only a part of the symbol or picture was drawn. This answered, in some degree, the purpose of a short-hand. After them the Hebrews, Greeks, and Romans, adopted different methods of abbreviating their words and sentences, suited to their respective languages. The initials, the finals, or radicals, often served for whole words; and various combinations of these sometimes formed a sentence. Arbitrary marks were likewise employed to determine the meaning, and to assist legibility; and it seems probable that every writer, and every author of antiquity, had some peculiar method of abbreviation, calculated to facilitate the expression of his own sentiments, intelligible only to himself. It is also probable that some might by these means take down the heads of a discourse or oration: but few, very few, it is presumed, could have followed a speaker through all the meanders of rhetoric, and noted with precision every syllable, as it dropt from his mouth. To arrive at such a degree of excellence in this art was reserved for modern times, and is still an acquisition by no means general.

Some writers have ascribed to the Roman poet Ennius the merit of having first invented a method of writing, by which the notarii were enabled to follow the most rapid of their orators. This, however, is extremely hypothetical. It is added, that Ennius's method was much improved upon by Tyro, Cicero's freed-man; and still more by the learned Seneca. Ennius, it appears, began at first to write with 1100 marks of his own contrivance, to which he might add, as circumstances and necessity demanded. In what the subsequent improvements consisted we have no account; probably only in the invention of new symbols or characters, and not in any attempt to write in a short manner, by the combination of new and more simple letters. The Romans certainly held this art in great estimation; for Suetonius, speaking of Caligula, expresses his surprise, that an emperor, who, notwithstanding his numerous vices, was not

deficient in capacity and parts, should remain ignorant of the art of stenographic writing. Titus Vespasian, in almost every respect a very different character from Caligula, is mentioned as being remarkably attached to short hand, and himself practised it with great facility, and often made it both his business and his amusement. He seemed to have great pleasure in calling his amanuenses together, and witnessing which of them wrote the fastest.

The art after this was much neglected, as is evident from two books of short-hand, mentioned by Trithemius. The first was a Short-Hand Dictionary, which he bought of an abbot, a doctor of law, for a few pence, to the great satisfaction of the community to which he belonged, who had desired the short-hand marks to be erased, for the sake of the parchment on which they were written. The other was a short-hand copy of the Book of Psalms, which he met with in another monastery, where the monks has inscribed upon it, by way of title, A Psalter in the Armenian Language. Several copies, however, of a Dictionary and Psalter, in Roman short-hand, are mentioned as extant in different libraries; but they are in general the same method, as may be conjectured from those who mention them, and also from the appearance of an old short-hand Psalter in the library of St. Germain, at Paris, carefully preserved as a stenographical curiosity. The late Mr. Byrom had a few pages of this transcribed for his inspection. Plutarch, in his Life of Cato, informs us, that the celebrated speech of that patriot, relating to the Catilinian conspiracy, was taken and preserved in short-hand; and there are numerous epigrams of Ausonius, Martial, and Manilius, commendatory of the art. But we must pass over other ancient allusions and conjectures, only observing, that, probably, the oldest method of short-writing at present extant or known is a Latin MS., entitled *Ars Scribendi Characteris*, or *The Art of Writing in Characters*. The author of this is unknown; but it was printed about the year 1412.

In every language of Europe, till about the close of the sixteenth century, the Roman plan of abbreviating (*viz.* substituting the initials or radicals, with the help of arbitraries, for words) appears to have been employed. Till then no regular alphabet had been invented expressly for stenography, when an English gentleman of the name of Willis invented and published one. His plan was soon altered and improved, or at least pretended to be so. One alteration succeeded another; and at intervals, for a great number of years, men of ingenuity and application have

composed and published systems of stenography, and doubtless have themselves reaped all the advantages that attend it. But among the various methods that have been proposed, and the different plans that have been adopted by individuals, none has yet appeared fortunate enough to gain universal approbation; or proved sufficiently simple, clear, and concise, to be generally studied and practised. This would seem, indeed, to be an art so largely depending on practical and manipulative skill, that no theory, however simple or scientific, can without extensive practice be of much importance to the student: while a comparatively imperfect system, in which the writer is well and habitually exercised, will be found of importance to many professions and stations in life.

English writers on stenography, are Addy, Aldridge, Angell, Annet, Blandemore, Blosset, Botley, Bridges, Byrom, Coles, Cross, Dix, Everardt, Ewen, Facey, Farthing, Gibbs, Græme, Gurney, Heath, Holdsworth, Hopkins, Jeake, Labourer, Lane, Lyle, Macauley, Mason, Mavor, Metcalfe, Nicholas, Palmer, Rich, Ridpath, Shelton, Steele, Tanner, Taylor, Thicknesse, Tiffen, Webster, Weston, Williamson, Willis, B. D., and Willis, &c. Of all these Dr. Mavor has been thought to give the most complete work in his *Universal Stenography*, now used as a class book in many schools: others, however, prefer Rich's system as improved by Dr. Doddridge. Mr. Gurney's, perhaps, has been most extensively and respectably practised in this country.

Some systems are replete with unmeaning symbols, perplexing arbitraries, and ill judged contractions; which render them so difficult to be attained by a common capacity, or ordinary application, that it is not to be wondered at if they have sunk into neglect, and are now no longer known. Other schemes, by being too prolix, by containing a multiplicity of characters, and those characters not simple or easily remembered, become ineffectual to the purpose of expedition, and are only superior in obscurity to a common hand. Some, again, not only reject all arbitrary characters and contractions, but even prepositions and terminations; which last, if not too lavishly employed and badly devised, highly contribute to promote both expedition and legibility; and, though they reduce the characters to fewer than can possibly express the various modifications of sound, yet they make nearly one-half of them complex. In the disposition of the vowels, there is the greatest perplexity in most systems. A dot is sometimes substituted for all the vowels indiscriminately, and the judgment is left to determine which letter out of six any dot is intended to express; or a minute space is allotted them; so that, unless they be arranged with mathematical precision, they cannot be distinguished from one another; but such a minute attention is inconsistent with the nature of short hand, which should teach us to write down in a short time, as well as in small bounds, what we wish to preserve of what we hear. Nor is the plan of lifting the pen and putting the next consonant in the vowel's place, in the middle of words, less liable to objections; or that of representing all the vowels by distinct characters,

being obviously ill calculated for facility and despatch, and consequently inadmissible into any useful system. The person who first proposed the omission of vowels in the middle of words, which it is obvious are not wanted, and invented letters, which could be connected as in a running hand without lifting the pen in the middle of the word, made a real improvement on the works of his predecessors. But most systems labor under the capital defect of being too complicated, and so defeat the end of their invention; for they can neither be learned with ease, nor remembered with accuracy, nor be practised with the expedition which is requisite.

The method first subjoined will be found superior to most yet published, in the disposition of the vowels and the facility of arranging them, the confusion in placing which seems to detract from the merit of the best performances: and it may be affirmed, without ostentation, that characters, simpler in their form, and more perfect in their union, have not been applied to the art of stenography. As well as it could be determined, the simplest characters are appropriated to the letters most usually employed: indeed, as far as possible, those which are complex have been rejected; but as it was an object always kept in view that the writing should be on a line, a few were admitted into the alphabet for that reason.

In forming the characters for the double and triple consonants, care has been taken to provide against all obscurity which might arise by adopting letters too similar in their formation; and, with respect to the prepositions and terminations, those which occur most frequently are expressed by the simplest characters. The arbitraries are few in number, and the abbreviations, as they are entirely from the letters of the alphabet, and chosen from some thousands of words in common use, will well repay the learner for an hour's trouble in committing them to memory.

In the last section is laid down a scheme of abbreviation, comprised in a few rules, perfectly easy to be understood and practised by proficients in this art. The learner is, however, advised by no means to adopt any of them, till experience has convinced him that they may be used without error or injury to legibility. All abbreviating rules are suited to those only who have made some progress in the stenographic art; for although they certainly promote expedition, and afford the greatest ease to a proficient, yet a learner, as expedition is not his first, though his ultimate view, should admit of nothing that in the least renders the reading difficult.

SECT. II.—OF THE PRINCIPLES OF STENOGRAPHY.

The English alphabet consists of twenty-six letters; six of which are vowels, as every school-boy knows. This alphabet, as is observed by the best grammarians who have written on the language, is both defective and redundant in expressing the various modifications of sound. But all modern alphabets are equally, and some more anomalous in these respects. But as it is not our intention to propose a mode of spelling different from that in common use, when applied to printing or long-hand writing, we shall only

observe that in stenography, where the most expeditious and concise method is the best, if consistent with perspicuity, the following simple rules are studiously to be practised.

RULE I.—All quiescent consonants in words are to be dropped, and the orthography to be directed only by the pronunciation; which, being known to all, will render this art attainable by those who cannot spell with precision in long-hand.

RULE II.—When the absence of consonants, not entirely dormant, can be easily known, they may often be omitted without the least obscurity.

RULE III.—Two, or sometimes more, consonants may, to promote greater expedition, be exchanged for a single one of nearly similar sound; and no ambiguity as to the meaning ensue.

RULE IV.—When two consonants of the same kind or same sound come together, without any vowel between them, only one is to be expressed; but, if a vowel or vowels intervene, both are to be written: but if they are perpendicular, horizontal, or oblique lines, they must only be drawn a size longer than usual; and characters with loops must have the size of their heads doubled. See plate STENOGRAPHY.

Might is to be written *mit*, fight *fit*, machine, *maschin*, enough *enuf*, laugh *laf*, prophet *profet*, physics *fisiks*, through *thro'*, foreign *foren*, sovereign *soveren*, psalm *sam*, receipt *reset*, write *rite*, wright *rit*, island *iland*, knavery *navery*, temptation *temptation*, knife *nife*, stick *stik*, thigh *thi*, honor *onor*, indictment *inditement*, acquaint *aquaint*, chaos *kaos*, &c. Strength *strength*, length, *lenth*, friendship *frenship*, connect *conek*, commandment *comanment*, conjunct *conjunt*, humble *humle*, lumber *lumer*, slumber *slumer*, number *numer*, exemplary *exemlary*, &c. Rocks *rox*, acts *aks* or *ax*, facts *faks* or *fax*, districts *districks* or *distrix*, affects *afeks* or *afex*, afflicts *afliks* or *aflix*, conquer *konkr*, &c. Letter *leter*, little *litle*, command *comand*, error *error*, terror *teror*, &c. But in *remember*, *moment*, *sister*, and such like words, where two consonants of the same name have an intervening vowel, both of them must be written.

These four rules, with their examples, being carefully considered by the learner, will leave him in no doubt concerning the disposition and management of the consonants in this scheme of short-writing; we shall therefore proceed to lay down rules for the application of the vowels with ease and expedition.

RULE I.—Vowels, being only simple articulate sounds, though they are the connectives of consonants, and employed in every word and every syllable, are not necessary to be inserted in the middle of words; because the consonants, if fully pronounced, with the assistance of connexion, will always discover the meaning of a word, and make the writing perfectly legible.

RULE II.—If a vowel is not strongly accented in the incipient syllable of a word, or if it is mute in the final, it is likewise to be omitted; because the sound of the incipient vowel is often implied in that of the first consonant, which will consequently supply its place.

RULE III.—But if the vowel constitutes the first or last syllable of a word, or is strongly ac-

cented at its beginning or end, that vowel is continually to be written.

RULE IV.—If a word begins or ends with two or more vowels though separated, or when there is a coalition of vowels, as in diphthongs and triphthongs, only one of them is to be expressed, which must be that which agrees best with the pronunciation.

RULE V.—In monosyllables, if they begin or end with a vowel, it is always to be inserted, unless the vowel be *e* mute at the end of a word.

Such are the general principles of this art; in vindication and support of which it will be needless to offer any arguments, when it is considered that brevity and expedition are the chief objects, if consistent with legibility; and the subsequent specimens in the orthography recommended will, we hope, be sufficient to show that there is no real deficiency in the last mentioned particular.

He who md us mst be etrnal, grt, nd mnptnt. It is ur dty, as rsnl bngs, to srv, lv, nd oby hm. A mn tht wd avd blm shd be srkmspk in al his axns, nd ndr wth al hs mt to pls evry bdy.—I wd nt frm any knxns wth a mn who hd no rgrd fr hmslf; nthr wd I bly a mn who hd ons tld me a li.—Omr is of al thngs the mst df klt to prsrv ntrnshd; nd whn ons mpchd, lk the chsty of a wmn, nvr shns wth its wntd lstr.—Wth gd mnrs, kmplsns, nd an esy plt adrs, many mk a fgr in the wrld, whs mntl ablt wd skrsly hv rsd thm abv the rnk of a ftm.—Idlms is the prnt of a thsnd msfrits, wch ar nvr fit by the ndstrs: it is a pn nd a pnshmnt of itself, nd brngs wnt nd bgrv in its trn.—Vrtu is the frst thng tht shd be rgrdd; it is a rwr of tsf: mks a mn rspktbl hr, nd wl mk hm etrnly hpy hrfr.—Prd is a mst pruss psn, wch yt ws plntd by hvn in ur ntr, to rs ur emsn to imtt grt nd wrthy krkrs or axns, to xt in us a sl fr wht is rt nd grst, nd a ldbl ndgnns gnst oprsrs nd wrks of any kind of nkty; in shrt, to mk us st a prpr vlu upn urslvs, nd dsps a wrthls flo, hu evr xlt. But al pd of ths sd is fly, nd evr to be avdd.

SECT. III.—OF THE STENOGRAPHIC ALPHABET.

As the whole of this art depends upon a regular method, and a simple alphabet, we have not only endeavoured to establish the former on satisfactory principles, but have been careful to appropriate, according to the comparative frequency of their occurrence, such characters for the letters, as, after repeated trials and alterations, were conceived to be the best adapted for despatch.

The stenographic alphabet consists of eighteen distinct characters (viz., two for the vowels and the rest for the consonants), taken from lines and semicircular curves; the formation and application of which we shall now explain, beginning with the vowels. For the first three vowels, *a*, *e*, and *i*, a comma is appropriated in different positions; and for the other three, *o*, *u*, and *y*, a point. The comma and point, when applied to *a* and *o*, is to be placed, as in the plate at the top of the next character; when for *e* and *u*, oppo-

THE LORD'S PRAYER.

Handwritten notes and a diagram of the Lord's Prayer in shorthand, including the number 52.

site to the middle; and, when for *i* and *y*, at the bottom. This arrangement of the vowels we take to be the most simple and distinct that can easily be imagined. Places at the top, the middle, and the bottom of characters, which make three different positions, are as easily distinguished from one another as any three separate characters could be; and a comma is made with the same facility as a point.

Simple lines may be drawn four different ways; perpendicular, horizontal, and with an angle of about 45° to the right and left. An ascending oblique line to the right, which will be perfectly distinct from the rest when joined to any other character, may likewise be admitted. These characters, being the simplest in nature, are assigned to those five consonants which most frequently occur, viz., *l*, *r*, *t*, *c* hard or *k*, and *c* soft or *s*. Every circle may be divided with a perpendicular and horizontal line, so as to form likewise four distinct characters. These being the next to lines, in the simplicity of their formation, we have appropriated them for *b*, *d*, *n*, and *m*.

The characters expressing nine of the consonants are all perfectly distinct from one another; eight only remain which are needful, viz. *f*, *g* or *j*, *h*, *p*, *q*, *v*, *w*, and *x*; to find characters for which we must have recourse to mixed curves and lines. The characters which we have adopted are the simplest in nature after those already applied, admit of the easiest joining, and tend to preserve lineality and beauty in the writing. It must be observed that we have no character for *c* when it has a hard sound, as in castle; or soft, as in city; for it always has the sound of *k* or *s*, which in all cases will be sufficient to supply its place; or *c*, being easier written, might be used in all cases for the hard sound. *R* likewise is represented by the same character as *l*; only with this difference, *r* is written with an ascending stroke and *l* with a descending; which is always to be known from the manner of its union with the following character; but in a few monosyllables where *r* is the only consonant in the word, and consequently stands alone, it is to be made as is shown in the alphabet for distinction's sake. The character for *h*, when lineality requires it, may be made from the bottom and inverted, as already described. And often *h* may be omitted entirely. *Z*, as it is a letter seldom employed in the English language, and only a coarser and harder expression of *s*, may be supplied by *s* whenever it occurs: as for Zedekiah write Sedekiah, &c., or *z* itself may be used.

SECT. IV.—OF THE PREPOSITIONS AND TERMINATIONS.

The prepositions and terminations in this scheme are so simple, that the greatest benefit may be reaped from them, and very little trouble required to attain them; as the incipient letter or the incipient consonant of all the prepositions, and of several of the terminations, is used to express the whole. But, although we have already given sufficient specimens of the manner of their application, that the learner of more slow perception may have every assistance, we have subjoined the following directions:—

RULE I.—The preposition is always to be written without joining, yet so near as plainly to show what word it belongs to; and the best way is to observe the same order as if the whole was to be connected.

RULE II.—A preposition, though the same letters that constitute it may be met with in the middle or end of a word, is never to be used, because it would expose to obscurity.

RULE III.—Observe that the preposition *omni* is expressed by the vowel *o* in its proper position; and for *anti*, *anta*, *ante*, by the vowel *a*, which the radical part of the word will easily distinguish from being only simple vowels.

The first rule for the prepositions is (allowing such exceptions as may be seen in the plate) to be observed for the termination; and also the second *mutatis mutandis*; except that whenever *sis*, *sus*, *sys*, *cius*, *tious*, and *ces*, occur, they are to be expressed as directed in the fourth rule for the consonants, whether in the beginning, middle, or end of words. But in a few words, where three horizontal characters meet, it will be better to express the *sis*, &c., by the semielliptical character in plate I. opposite *tious*.

RULE IV.—The terminative characters for *tion*, *sion*, *cion*, *cian*, *tian*, is to be expressed by a small circle joined to the nearest letter, and turned to the right; and the plurals *tions*, *sions*, *cions*, *cians*, *tians*, *tiences*, by a dot on the same side.

RULE V.—The terminative character for *ing* is to be expressed likewise by a small circle, but drawn to the left hand; and its plural *ings* by a dot. In horizontal characters, by the left hand is meant the top, and by the right the space below the letter. See *ing* which is joined. In all other characters the right and left positions cannot be mistaken.

RULE VI.—The plural sign *s* is to be added to the terminative characters when necessary.

RULE VII.—The separated terminations are never to be used but in polysyllables, or words of more syllables than one.

These rules duly observed will point out a method as concise and elegant as can be desired, for expressing the most frequent and longest prepositions and terminations in the English language. If it should be thought necessary to increase their number, by the addition of others, it will be an easy matter for any one of the least discernment to do so, by proceeding on the principles before laid down.

SECT. V.—RULES FOR ABBREVIATIONS.

Though a more concise method of writing, or more numerous abbreviations may not be indispensably necessary, if the foregoing directions be practised for a considerable time, yet contractions will be found extremely useful and convenient to those who have attained a proper knowledge of the subject, and lead to a greater degree of expedition, at the same time that they diminish the labor of writing. It has been observed in the introduction that abbreviations are only to be employed by proficient in this art; because expedition is not the first, though the ultimate object in view; and that an easy legibility is of the utmost consequence to the learner; which, however, cannot be preserved, if he adopts too soon

those very rules which in time will afford him the greatest ease when applied with judgment.

The following short and practical rules will be found fully adequate to every purpose for which they were intended, and are far superior in the facility of their application to any which we have seen.

RULE I.—The usual abbreviations in long-hand are always to be followed; as Mr. for Master, M. D. for Doctor of Physic, and Abp. for Archbishop, &c.

RULE II.—Substantives, adjectives, verbs, and participles, when the sense will direct to the meaning, are to be expressed by their initial consonant with the distinguishing marks exhibited in our plate; viz. as substantive must have the dot exactly over its initial consonant; an adjective must have a dot under it; a verb is to be expressed by a comma over its initial consonant; and a participle by a comma under. The dot or comma, being placed thus, will never occasion them to be mistaken for vowels, because they should always be on one side or other; whereas the marks for parts of speech must constantly be placed exactly over or under. These being the four principal parts of speech will be sufficient; and an adept will never be at a loss to know when he can with safety apply this rule to them.

RULE III.—To render the writing more legible, the last letter of the word may be joined to the first, and the proper mark applied.

RULE IV.—The constituent or radical part of words, especially if they are long, will often serve for the whole, or sometimes the first syllable; as, we ought to moderate our *ex.* by our *circum.*; a man's *man.* commonly shape his *for.*

RULE V.—All long words without exception may have their prepositions or terminations expressed by the incipient consonant of such preposition or termination.

RULE VI.—When there is a great dependence between the parts of a sentence, the initial letter will often suffice; as, *L.* is the capital of Great *B.*; the eldest *S.* of the king of *G. B.* is styled *P.* of *W.* Every one, it is presumed, will allow this to be perfectly legible, either in long or short hand.

RULE VII.—The termination *ness* and *less* may be omitted; as faithfulness is only to be written *faithful*; forwardness, *forward*; heedless, *heed*; stubbornness, *stubborn*, &c.

RULE VIII.—The second and third persons of verbs, ending in *eth* and *est*, may be expressed by *s*; as, he *loves*, thou *teaches*; instead of he *loveth*, thou *teachest*; or even without *s*; as, he *love*, &c.

RULE IX.—Words naturally supplied by the sense may only often be entirely omitted, and yet no ambiguity ensue; as, In beginning God created heaven and earth, for In *the* beginning God created *the* heaven and *the* earth.

RULE X.—When there is an immediate repetition of a sentence or word, a line is to be drawn under the sentence or word to be repeated; as, Amen, Amen, is to be written Amen; but if any words intervene, before a word or sentence is to be repeated, the line must be drawn as before, and a ^ or mark of omission placed where the

repetition should begin; as, Is it just the innocents should be condemned, reviled?

SPECIMEN OF STENOGRAPHIC LETTER.

I. Fabricius's Reply to Pyrrhus.—As to my poverty, you have indeed, Sir, been rightly informed. My whole estate consists in a house of but mean appearance, and a little spot of ground, from which by my own labor I draw my support. But if by any means you have been persuaded to think that this poverty makes me less considered in my country, or in any degree unhappy, you are extremely deceived. I have no reason to complain of Fortune: she supplies me with all that nature requires; and, if I am without superfluities, I am also free from the desire of them. With these, I confess I should be more able to succor the necessitous, the only advantage for which the wealthy are to be envied; but, as small as my possessions are, I can still contribute something to the support of the state and the assistance of my friends. With regard to honors, my country places me, poor as I am, upon a level with the richest; for Rome knows no qualifications for great employments but virtue and ability. She appoints me to officiate in the most august ceremonies of religion; she entrusts me with the command of her armies; she confides to my care the most important negotiations. My poverty does not lessen the weight and influence of my counsels in the senate; the Roman people honor me for that very poverty which you consider as a disgrace; they know the many opportunities I have had in war to enrich myself without incurring censure; they are convinced of my disinterested zeal for their prosperity; and, if I have anything to complain of in the return they make, it is only the excess of their applause. What value then can I set upon your gold and silver! What king can add any thing to my fortune! Always attentive to discharge the duties incumbent on me, I have a mind free from self-reproach, and I have an honest fame.—Dodsley's Preceptor.

II.—A letter to a friend against waste of time. Converse often with yourself, and neither avish your time nor suffer others to rob you of it. Many of our hours are stolen from us, and others pass insensibly away; but of both these losses the most shameful is that which happens through our own neglect. If we take the trouble to observe, we shall find that one considerable part of our life is spent in doing evil, and the other in doing nothing, or in doing what we should not do. We don't seem to know the value of time, nor how precious a day is: nor do we consider that every moment brings us nearer our end. Reflect upon this, I entreat you, and keep a strict account of time. Procrastination is the most dangerous thing in life. Nothing is properly ours but the instant we breathe in, and all the rest is nothing; it is the only good we possess; but then it is fleeting, and the first comer robs us of it. Men are so weak that they think they oblige by giving of trifles, and yet reckon that time as nothing for which the most grateful person in the world can never make amends. Let us therefore consider time as the most valuable of all things; and every moment spent without

some improvement in virtue, or some advancement in goodness, as the greatest sublunary loss.

III. *St. Paul's speech before Agrippa and Festus.* See Acts, xxvi. 1—29.

SECT. VI.—MR. GURNEY'S SYSTEM.

This, as we have intimated, is the system which has been for many years most extensively patronised by parliament and the government. We subjoin the Introduction of the late Mr Gurney; and cannot do better than give a general outline of his published remarks which are said to contain 'the whole theory.

To constitute a good system of short-hand, says this writer, it is essential—1. That the characters be as simple as possible, in order to their being written with facility: and, 2. That they be so distinct as to be read with ease at any distance of time.

The only distinct marks which can be made use of are a point, a circle, a straight line, and a curve. These may be varied by position.

As a point cannot be distinctly joined with any other character, it is unfit to be introduced into the alphabet. There are no other distinct positions of a straight line than horizontal, perpendicular, and oblique: thus; — | \ /

The curve may be varied in the same manner; thus: ○ ○ ○ ○

The practise of placing a character above o below the line; and also of varying it, by thickness or length, I totally expunge; as it could never be written swiftly, with any tolerable degree of precision.

We have therefore but nine simple distinct marks: namely, a straight line, and a curve, each in four different directions; and a circle: whence it is obvious that these nine marks should be made to express those consonants which most frequently occur in the short-hand orthography (the vowels being never written but when used to begin a word). The rest of the alphabet must necessarily consist of compound characters, which I have endeavoured to render as simple as possible.

It will, likewise, be noticed, that the same character being made to express *a*, *s*, and *z*, the *a* must be struck upwards, the *s* and *z* downwards. As the *a* is never written singly, the succeeding character will, at first view, show which letter is intended to be expressed.

When the letter *r* does not begin a word, it is expressed by a stroke upwards; of which there are several specimens in the second column of the first page.

The long *s* is only to be used at the beginning and end of words. The circle is not to be written for *s*, at the beginning of a word, except when *t* immediately follows; and never at the end of a word, for it would then stand for *ing* or *ong*. When *s* immediately follows *r*, the oblique upward stroke is only prolonged.

The first four engraved pages in Mr. Gurney's admirable book contain the whole theory of the art.

The alphabet should be got perfectly in memory; and also the words which the letters stand for when wrote single. The other column, on the first page, is designed to give the learner

an idea of the manner of joining the letters, and of spelling words; but need not be committed to memory.

On the second page, the method of expressing the vowels is shown. Here the rules only are to be got in memory; the short-hand characters being merely an illustration of the rules.

When a person has made himself master of the alphabet, and of the method of expressing the vowels, he will then be able to write any thing in the English language. But as it would be impossible, in that case, to write with swiftness sufficient to answer the usual purposes of short-hand, we are under the necessity of using contractions, and arbitrary characters; care, however, should be taken that too many of these be not crowded upon the memory. I have dismissed a great number which had place in the former editions of this system: and, to shorten the trouble of the learner, have disembarassed the art from many needless difficulties and real incumbrances.

The arbitrary characters, on the remainder of the second and third pages, should be got in memory; as should, too, the abbreviating rules, on the fourth page.

The whole residue of the engraved pages is all mere matter of example and explanation.

It will be observed that in the spelling of words no particular regard is had either to the retaining or omitting of vowels; but such letters only are made use of as convey, by their sound, a competent idea of the word designed: and, therefore, one person may, if he so choose, admit more letters in a word than another. The farther, however, any person is advanced in the practice and experience of the art the more concisely he will write; that is, the fewer letters will he use in spelling a word.

It is impossible to compose any system of short-hand, in which various words will not be spelt alike, or written with the same letters. For instance: *despise* and *dispose*. *Dspis* will stand for either word. But, in such case, the sense and connexion will immediately distinguish for which of these two words the contraction stands.

If any arbitrary character, or contracting rule, should not be instantaneously recollected; it will be attended with no other inconvenience than the loss of the advantage arising from the use of such abbreviation; as the writer will then be obliged to pen it in the same manner as any other word for which there is no arbitrary character.

'When a word is meant to be erased, draw two lines through it. If several words are meant to be obliterated, a single line drawn through them all will be sufficient. I need say nothing with regard to punctuation. Were points, or stops, introduced into short-hand, they would both impede the writer's despatch, and tend to confuse the characters. Though of manifest use in long-hand, the admission of them would be quite unserviceable and even highly detrimental in brachygraphy. To remedy the want of them, the writer has only to leave a short vacancy between each sentence; and, for every new paragraph, to begin a fresh line.'

STENTOR, a Grecian herald who went to the Trojan war, and whose voice, says Homer, was so strong that it exceeded that of fifty men together.—Hom. II. v. 784. Hence the following derivatives.

STENTOREAN, strong-voiced; long-tongued.

STENTOROPHON'ICK, *adj.* From Stentor, the Homerick herald, and φωνη, a voice. Loudly speaking or sounding.

Of this *stentorophonick* horn of Alexander there is a figure preserved in the Vatican.

Derham's Physico-Theology.

STENWYCK (Henry), an eminent Dutch painter, born in 1550. He studied under John de Vries, who was eminent in architecture and perspective, but Henry excelled him. His Night Views of the Insides of Churches, illuminated by candles and flambeaux, were much admired. He died in 1603.

STENWYCK (Henry), the Younger, son of the old Henry, was taught by his father, and became also eminent. He came over to England, where he was much patronised by Charles I. He died at London in 1640.

STEP, *v. n. & n. s.* } Sax. *ƿæppan*; Belg.

STEPPING-STONE, } *stappen, stap*; Goth *stef*.
To move by a single movement of the foot; advance by a sudden progression; go; move mentally; walk gravely or slowly: a movement of this kind, corporeal or mental; the space moved over; progression; gradation; gait: in composition, step signifies one removed one degree from affinity by blood, i. e. one related only by marriage.

There is but a *step* between me and death.

1 Sam. xx. 3.

Whosoever first, after the troubling the water, *stepped* in, was made whole. *John v. 4.*

His wanton *step-dame* loved him the more;
But when she saw her offered sweets refuse,
Her love she turned to hate.

Spenser.

How should their minds chuse but misdoubt,
lest this discipline, which always you match with divine doctrine as her natural and true sister, be found unto all kinds of knowledge a *step-mother*. *Hooker.*

The same sin for substance hath sundry steps and degrees, in respect whereof one man becometh a more heinous offender than another. *Perkins.*

Pyrrhus, the most ancient of all the bashaws *stepped* forth, and, appealing unto his mercies, earnestly requested him to spare his life.

Knolles's History of the Turks.

While Solyman lay at Buda, seven bloody heads of bishops slain in battle were set in order upon a wooden *step*. *Knolles.*

Ventidius lately

Buried his father, by whose death he's *stepped*
Into a great estate. *Shakspeare. Timon.*

See where he comes; so, please you, *step* aside:
I'll know his grievance. *Id. Romeo and Juliet.*

Thou sound and firm-set earth,
Hear not my *steps*, which way they walk.

Id. Macbeth.

Lingering perdition, worse than any death
Can be at once, shall *step* by *step* attend
You and your ways. *Id. Tempest.*

You shall not find me, daughter,
After the slander of most *step-mothers*,
Ill-eyed unto you. *Id. Cymbeline.*

A father cruel, and a *step-dame* false. *Shakspeare.*
Cato the elder being aged, buried his wife, and married a young woman: his son came to him, and

said, Sir, what have I offended, that you have brought a *step-mother* into your house? The old man answered, Nay, quite the contrary, son; thou pleasest me so well, as I would be glad to have more such.

Bacon.

The breadth of every single *step* or stair should be never less than one foot, nor more than eighteen inches. *Wotton.*

One of our nation hath proceeded so far that he was able, by the help of wings, in a running pace, to *step* constantly ten yards at a time.

Wilkins's Mathematical Magick.

When you *stepped* forth, how did the monster rage,
In scorn of your soft looks and tender age!

Cowley.

My brothers, when they saw me wearied out,
Stepped, as they said to the next thicket side
To bring me berries. *Milton.*

O may thy power, propitious still to me,
Conduct my *steps* to find the fatal tree
In this deep forest. *Dryden's Æneid.*

The name of *step-dame*, your practised art,
By which you have estranged my father's heart,
All you have done against me, or design,
Shows your aversion, but begets not mine.

Id. Aurengezebe.

A *step-dame* too I have, a cursed she,
Who rules my hen-pecked sire, and orders me.

Dryden.

Who was the first to explore the untrodden path,
When life was hazarded in every *step*?

Addison's Cato.

The old poets *step* in to the assistance of the medicalist. *Addison.*

Those heights where William's virtue might have staid,
And on the subject world look'd safely down,

By Marlbro' passed, the props and *steps* were made
Sublimar yet to raise his queen's renown. *Prior.*

To derive two or three general principles of motion from phenomena, and afterwards to tell us how the properties and actions of all corporeal things follow from those manifest principles, would be a very great *step* in philosophy, though the causes of those principles were not yet discovered. *Newton.*

The gradus, a Roman measure, may be translated a *step*, or the half of a passus or pace.

Arbutnot on Coins.

Any body would have guessed Miss to have been bred up under the influence of a cruel *step-dame*, and John to be the fondling of a tender mother.

Id. History of John Bull.

The reputation of a man depends upon the first *steps* he makes in the world. *Pope.*

They are *stepping* almost three thousand years back into the remotest antiquity, the only true mirror of that ancient world.

Id. Preface to the Iliad.

One injury is best defended by a second, and this by a third: by these *steps* the old masters of the palace in France became masters of the kingdom; and by these *steps* a general during pleasure might have grown into a general for life, and a general for life into a king. *Swift.*

When your master wants a servant who happens to be abroad, answer, that he had but that minute *stept* out. *Id.*

Like *stepping-stones* to save a stride,
In streets where kennels are too wide. *Id.*

Home the swain retreats,
His flock before him *stepping* to the fold.

Thomson's Summer.

It was a saying among the ancients, Truth lies in a well; and, to carry on this metaphor, we may

justly say, that logick does supply us with *steps*, whereby we may go down to reach the water. *Watts.*

The querist must not proceed too swiftly towards the determination of his point, that he may with more ease draw the learner to those principles *step by step*, from whence the final conclusion will arise.

Id.

STEP, in a ship, a block of wood fixed on the docks or bottom of a ship, and having a hole in its upper side, fitted to receive the heel of a mast or capstern. The steps of the main and fore-masts of every ship rest upon the keelson, to which they are firmly secured by knees, bolts, or spike-nails. The step of the mizen-mast usually rests upon the lower deck.

To STEP, in military affairs, is to move forward or backward, by a single change of the place of the foot. **To step out**, to lengthen your pace. **To step short**, according to the regulations, is to diminish or slacken your pace. This step is useful when a momentary retardment of either a battalion in line, or of a division in column, shall be required. **To step out**, according to the regulations, is to lengthen the step to thirty-three inches, by leaning forward a little, but without altering the cadence. This step is necessary when a temporary exertion in line and to the front is required; and is applied both to the ordinary and quick time. These phrases are frequently used in military movements, when it is found necessary to gain ground in front, or to give the rear of a column, &c., time to acquire its proper distance. The officer who leads a head division, should be particularly attentive, when he is ordered to step out, or step short, especially in the different wheelings, not to lose the precise moment when either may be thought expedient; and, in marching in open column, every successive officer should watch the seasonable moment, after a wheel, of preserving his relative distance.

To STEP off, in a military sense, to take a prescribed pace from a halted position, in ordinary or quick time, in conformity to some given word of command or signal.

Balancing STEP (Fr. pas d'école), a step so called from the body being balanced upon one leg, in order to render it firm and steady in military movements, &c. Men at the drill should be frequently exercised in this step.

The side or closing STEP (Fr. pas de côté, ou pas serré), a step which is taken in order to gain ground to the right or left, without altering the front of the battalion, or of closing it to its centre, whenever a chasm occurs in the line after it has wheeled from the column, &c. According to the regulations, this step is performed from the halt, in ordinary time, by the following words of command:—Close to the right—march (Fr. appuyez, à la droite). Close to the left—march (Fr. appuyez à la gauche).

Back STEP (Fr. pas en arrière), a step taken to the rear from any position without any change of aspect. According to the regulations, the back step is performed in the ordinary time and length of pace, from the halt, on a given word of command. It will be generally recollected that a few paces only of the back step can be necessary at a time.

Vol. XXI.

STEP BACK, MARCH (Fr. en arrière, marche), a word of command which is given when one or more men are ordered to take the back step according to the regulation.

Quick STEP (Fr. pas accéléré), a military step consisting of thirty inches (of which 108 are to be taken in a minute, making 270 feet in a minute), which constitutes what is technically called quick time in marching.

Quickest STEP (Fr. pas précipité), a step measuring thirty inches, and of which 120, making 300 feet, may be taken in a minute. This step is applied chiefly to the purpose of wheeling, and is the rate at which all bodies accomplish their wheels; the outward file stepping thirty-three inches, whether the wheel is from line into column, during the march in column, or from column into line. In this time also, and by this step, should divisions double, and move up, when they pass obstacles in line; or when in the column of march the front of divisions is increased, or diminished.

To STEP BETWEEN, to interfere.

To STEP FORTH or FORWARD, to take an active part in any thing. Thus, when the circle was formed, the grenadiers stepped forward to beg off their comrade, &c. The officers stepped forward, and remonstrated against their colonel.

STEP (Fr. échelon), according to the translator of rules and regulations for the field exercise and manœuvres of the French infantry, échelon means, in a figurative sense, what we understood by step in military promotion. See **Grades Militaires** in the *Nouveau Dictionnaire Militaire*, by A. T. Gaigne.

STEP is likewise figuratively used to signify promotion. As, the next step from a lieutenancy is a troop or company, and from that to a majority; except in the guards, who have the exclusive privilege of going over this intermediate rank, and stepping into a lieutenant-colonelcy at once. The engineers enjoy the same privilege.

To STEP over, to rise above another. This term is generally used in a bad sense. As, young men of interest and connexion frequently step over old soldiers.

STEP and LEAP is one of the seven airs, or artificial motions of a horse, being as it were three airs. The step puts the horse upon the hand, and gives him a rise to leap, like unto one that runs before he leaps, and so may leap higher than he that goes every time a leap.

STEP-CHILD, the child of a husband or wife by a former marriage.

STEP-DAME (step and dame), a step-mother. See **STEP**, and **STEP-MOTHER**.

STEP-DAUGHTER (step and daughter), the daughter of one's husband or wife, by a former wife or husband; often very absurdly styled daughter-in-law, a term which should be restricted to the son's wife. See **AFFINITY**.

STEP-FATHER (step and father), the husband of a widow, who has children by a former husband. This degree is also confounded in common language, as well as in writing, and absurdly called father-in-law, a term which should be solely restricted to the father of a son's wife, or of a daughter's husband. See **AFFINITY**, and **FATHER-IN-LAW**.

STEPHANAS, one of the first Christian converts at Corinth, baptized by Paul. He came to Paul at Ephesus with Fortunatus and Achaicus.

STEPHANIDES (Gulielmus), or William Fitz-Stephen, an ancient English historian of the twelfth century, who flourished during the reign of king Stephen to that of Richard I. See **FITZ-STEPHEN**. He is highly praised by Leland, as well as Bayle, who compares him to Plato.

STEPHANIMUM, in botany, a genus of the monogynia order, and pentandria class of plants; natural order forty-seventh, stellatæ: CAL. monophyllous, turbinate, and quinquepartite: COR. monopetalous, funnel-shaped, having its tubes curved and ventricose: the pericarpium is a bilocular berry containing two seeds, flattened on one side and round on the other. This genus is nearly allied to that of *psychotria*. There is only one species, viz. *S. Guianense*, a native of the warmer parts of America.

STEPHANOPHORUS, in antiquity, the chief priest of Pallas, who presided over the rest. It was usual for every god to have a chief priest; that of Pallas was the Stephanophorus just mentioned, and that of Hercules was called *Daduchus*. Stephanophorus was also a priest that assisted the women in the celebration of the festival *Thesmophoria*.

STEPHANUS, an able grammarian, a native of Byzantium, who lived in the fifth or sixth century. He wrote a dictionary, in which he made a great number of observations, which showed the origin of cities and colonies, of which we have nothing remaining but a mean abridgment by *Hermolaus* the grammarian; but from that work the learned have received great light; and *Sigonius*, *Casaubon*, *Scaliger*, *Salmasius*, &c., have employed themselves in illustrating it.

STEPHANUS, the Latin name assumed by the learned printers of the name of Stephens. See **STEPHENS**.

STEPHEN, the first of the seven deacons, and first martyr for Christianity; whence he is called the protomartyr, from *πρωτος*, first. His election, miracles, apprehension, examination, glorious defence, and martyrdom, A. D. 33, are recorded in Acts vi. and vii. There is little else certain recorded of him. He is said to have been a leading man among the Hellenistic Jews, educated by *Gamaliel*, and one of our Lord's seventy disciples.

STEPHEN I., bishop of Rome, succeeded *LUCIUS* A. D. 253. He had a dispute with *St. Cyprian* and *Firmilian* about the rebaptisation of heretics, which he condemned. He suffered martyrdom, A. D. 257, during the persecution under *Valerian*.

STEPHEN II. was born in Rome, and was elected pope in 752. *Astolphus*, king of the Lombards, having threatened Rome, Stephen went to France, and asked the assistance of king *Pepin*, who marched into Italy, and prevailed on *Astolphus* to desist from his invasion. But on *Pepin's* departure *Astolphus* returned with his troops; on which *Pepin* attacked and defeated him, took several of his cities, and gave them to Stephen, which laid the foundation of that temporal power of the popes which afterwards became so enormous. Stephen died in 757.

STEPHEN III., a native of Sicily, was chosen Pope in 768. He was opposed by the anti-pope *Constantine*, who was condemned in a general council in 769. Stephen died in 772.

STEPHEN IV., a Roman, was elected in 816, and crowned *Louis I.* in France, but died in 817.

STEPHEN V. succeeded *Adrian III.* in 885; and is celebrated for his virtues, learning, and humility. He died in 891.

STEPHEN VI. was chosen by a party in 896, after the anti-pope *Boniface VI.* He caused the body of his predecessor *Formosus* to be taken up and thrown into the Tiber. But this act of vindictive malice rendered him so unpopular that the citizens revolted, took him prisoner, put him in jail, and soon after strangled him.

STEPHEN VII. succeeded *Leo VI.* A. D. 929, and died in 931.

STEPHEN VIII., a German, and a relation of the emperor *Otho I.*, was elected pope in 939, after *Leo VII.* His conduct was tyrannical and very disagreeable to the Romans. He died in 942.

STEPHEN IX., brother of *Godfrey* duke of Lower Lorraine, was elected pope in 1057. He assembled councils for a reformation of the morals of the clergy; which indeed they stood much in need of. He died in 1058.

STEPHEN, king of England. See **ENGLAND**.

STEPHEN BATTORI, an excellent king of Poland, if he had not been too zealous a Catholic. See **POLAND**.

STEPHEN (St.), king of Hungary, succeeded his father *Geisa* in 947. He was the apostle of his country; propagated Christianity among the wild Hungarians, and enacted wise laws: for which *Benedict IX.* canonised him. He died at *Buda* in 1038.

STEPHENS, a family of printers who flourished at the revival of learning, and contributed greatly towards dispelling the cloud of ignorance which had so long overshadowed Europe. Some of the classics before the sixteenth century were in a great measure lost, and all of them were exceedingly corrupted. By their abilities and indefatigable industry these defects were supplied, and the learned were furnished with beautiful and correct editions of the Greek and Roman authors.

STEPHENS (Henry), the first of these illustrious men, was born in France soon after the discovery of printing, about 1465. He settled as a printer at Paris under *Louis XII.* A great proportion of the books which he published were Latin: they are printed in the Roman letter, and are not inelegant, though some of them abound rather too much in contractions. He died about 1520, and left behind him three sons. His widow married *Simon de Colines (Colinæus, Lat.)*, who thus got possession of Henry's printing-house, and continued the profession till his death.

STEPHENS (Francis), the eldest son, carried on business along with his step-father *Colinæus*, and died at Paris in 1550.

STEPHENS (Robert), the second son, was born in 1503. In his youth he made great proficiency in the Roman, Greek, and Hebrew languages, and at the age of nineteen had acquired so much knowledge that his step-father *Colines* entrusted him with the management of his press. An

edition of the New Testament was published under his inspection, which gave great offence to the Paris divines, who accused him of heresy, and threatened to prevent the sale of the book. Soon after he began business himself, and married Perrete the daughter of Jodocus Badius, a printer and an author. She was a woman of learning. In 1531 he published his *Thesaurus*: a work of great importance, at which he labored for two years. The mark which he put upon all his books was a tree branched, with a man looking upon it, and these words, *Noli altum sapere*, to which he sometimes added *sed time*. In 1539 Francis I. made him his printer, and ordered a new set of elegant types to be founded for him. His frequent editions of the New Testament gave great offence to the doctors of the Sorbonne, who accused him of heresy for his annotations, and insisted upon the suppression of some of his books. Although Henry the French king in some measure protected him, the persecution of these divines rendered him so unhappy, not to mention the expense and loss of time which an almost constant attendance at court unavoidably occasioned, that in 1552 he abandoned his country and went to Geneva, where he embraced the Protestant religion. He was burnt in effigy at Paris, for having changed his religion, and was falsely calumniated with having stolen the king's types. After his arrival at Geneva he published an account of the dispute between him and the Paris divines, which does as much honor to his abilities as his *Thesaurus* does to his learning. He died in 1559, after a life of the most extraordinary industry. The books of which he was the editor were not fewer than 360. Many of them were ancient classics in different languages. Several were accompanied with annotations which he collected, and all of them were corrected by collating MSS. He was so anxious to attain perfect accuracy that he used to expose his proofs in public, and reward those who discovered a mistake. His books consequently were very correct. It is said that his New Testament, called *O Mirificam* (because the preface begins with these words), has not a single fault. He first divided the New Testament into verses. His estate was left exclusively to such of his children as should settle at Geneva. He left behind him three sons, Henry, Robert, and Francis.

STEPHENS (Charles), the third son of Henry, was also familiarly acquainted with the learned languages. This recommended him to Lazarus, de Baif, who made him tutor to his son, and in 1540 carried him along with him to Germany. He studied medicine, and practised it with success in France. He did not, however, forsake the profession of his family, but exercised it in Paris, where he became the editor of many books remarkable for neatness and elegance. He wrote above thirty treatises on different subjects, particularly on Botany, Anatomy, and History. He died in 1564.

STEPHENS (Robert), the son of Robert, did not accompany his father to Geneva, but continued to profess the Catholic religion, and to reside at Paris. His letter was remarkably beau-

tiful. He was made king's printer, and died about 1589.

STEPHENS (Francis), brother to the preceding, was also a printer. He embraced the Protestant religion, and resided at Geneva.

STEPHENS (Henry), the remaining son of Robert, was born at Paris in 1528. He became the most learned and most celebrated of all his family. From his very birth almost he gave proofs of uncommon abilities, and displayed an ardent passion for knowledge. He settled at Paris, and published the *Odes of Anacreon*. In 1554 he went to Rome, and thence to Naples. This journey was undertaken in the service of the French government. He was discovered, and would have been arrested as a spy, had he not by his skill in the language of the country been able to pass for a native of Italy. On his return to France he assumed the title of printer to Ulric Fugger, a very rich and learned German nobleman, who allowed him a considerable pension. In 1560 he married a relation of Henry Scrimzeour, a Scottish nobleman, with whom he was intimately acquainted. See SCRIMZEOR. In 1572 he published his *Thesaurus Linguae Graecae*, one of the greatest works, perhaps, that ever was executed by one man, if we consider the wretched materials which more ancient dictionaries could furnish. This work had been carried on at a greater expense than he could well bear. He expected to be reimbursed by the sale of the book, as he doubtless would have been; but John Scapula, one of his own servants, extracted from it whatever he thought would be most serviceable to students, and published it beforehand in 4to. By this act of treachery Henry was reduced to poverty. See SCAPULA. About this time he was much beloved by Henry III. of France, who treated him so kindly, and made him such flattering promises, that he resided frequently at court. But these promises were never fulfilled, owing to the civil wars which soon after distracted France, and the unfortunate death of king Henry himself. During the remainder of his life his situation was very unsettled. We find him sometimes at Paris, sometimes in Geneva, in Germany, and even in Hungary. He died at Lyons in 1598, at the age of seventy. He was fond of poetry from his very infancy. It was a custom of his to compose verses on horseback, and even to write them, though he generally rode a very mettlesome steed. His *Thesaurus* was his great work, but he was also the author of several other treatises. His poems are humorous: his *Apology for Herodotus* is a witty satire on the Roman Catholics. His *Concordance to the New Testament* must have been a laborious work, and has deservedly endeared him to every Christian who wishes to acquire a rational and critical knowledge of the Scriptures. The number of books which he published, though fewer than his father, was great, and superior in elegance to any thing which the world had then seen. He left behind him a son and two daughters, one of whom was married to the learned Isaac Casaubon.

STEPHENS (Paul), the son of Henry, continued his father's profession at Geneva. He was a man of learning, and wrote translations of several

books, and published a considerable number of the ancient classics; but not with his father's elegance. He died in 1627, aged sixty, after selling his types to one Chouet a printer.

STEPHENS (Anthony), son of Paul, the last printer of the family, abandoned the Protestant religion, and returned to France, the country of his ancestors. He received letters of naturalization in 1612, and was made printer to the king; but, managing his affairs ill, he was reduced to poverty, and obliged to retire into an hospital, where he died in 1674, miserable and blind, aged eighty.

STEPHENS (Robert), a learned English antiquary, born at Eastington, in Gloucestershire. He was educated at Wotton, and thence sent to Lincoln College, Oxford, in 1681. He then entered at the Middle Temple, and was called to the bar. In 1702 he published *A Collection of Bacon Lord Verulam's Letters*, with valuable notes. He died in 1732, when a second *Collection of Bacon's Letters*, made by him, was printed.

STEPHENS, CAPE, a cape on the north-west coast of America, in long. $197^{\circ} 41' E.$, lat. $63^{\circ} 33' N.$

STEPHENS, FORT (St.), a new town of the United States, in Washington county, Alabama territory. It is situated on the west bank of the Tombigbee, at the head of the sloop navigation, and is in a state of rapid improvement. It is built on very uneven ground, but in a healthy situation, and is the seat of government for the Alabama territory. 100 miles above Mobile by land, 120 or 130 by the river; 1081 miles from Washington.

STEPHEN'S CHAPEL, (St.), the old building on the site of the late house of commons, and frequently giving name to it. See **WESTMINSTER**.

STEPHEN'S DAY, (St.), a festival of the Christian church, observed on the 26th of December, in memory of the first martyr St. Stephen.

STEPHEN'S ISLAND, an island so called by Vancouver on the north-west coast of North America, about thirty miles in length. It is about ten miles to the north of Pitt's archipelago. On the north-west side is a range of innumerable rocky islets and rocks, occupying a space of about two miles in width. Long. $229^{\circ} 30' E.$, lat. $54^{\circ} 11' N.$

STEPHEN'S ISLANDS, two small islands in the Eastern Seas, discovered by Carteret in 1767. They run about north-west by west, and south-east by east; one is about three miles long, and the other about six. The passage between them appeared to be about two miles broad. They are surrounded with extensive reefs. Long. $138^{\circ} 39' E.$, lat. $0^{\circ} 22' S.$

STEPHEN'S ISLAND, in Torres Strait, north of Darnley's island, lying about long. $143^{\circ} E.$, lat. $9^{\circ} S.$ The cocoa nut grows abundantly here, and the natives dwell in huts, wherein are images of their gods, also several human skulls.

STEPHEN'S PASSAGE, the strait which divides Admiralty Island from the west coast of North America. Its general direction is nearly north, in which direction it extends along the eastern shore of Admiralty Island. The channel be-

tween Douglas's Island and the mainland was found by Vancouver's exploring party to be interrupted with ice, even in the month of August. The other takes a north-east direction from Point Salisbury about thirteen miles, and was encumbered with a great quantity of floating ice, the weather also being extremely cold. The shores at its termination spread out to east and west, and form a basin about a league broad and two across. From the shores of this basin the party saw a compact body of ice extending some distance all around; and the adjacent region is composed of a lofty range of frozen mountains, whose sides, almost perpendicular, are formed entirely of rock, excepting close to the water side, where a few scattered dwarf pine trees found sufficient soil to vegetate in. Above these the mountains were wrapt in undissolving frost and snow. From the gullies in their sides were projected immense bodies of ice, that reached perpendicularly to the surface of the water in the basin, and exhibited as dreary and inhospitable an aspect as the imagination can suggest. Long. of the south entrance $226^{\circ} 35' E.$, lat. $57^{\circ} 29' N.$

STEP-MOTHER. The wife of a man, who has children by a former marriage; often erroneously styled mother-in-law, though no degrees in affinity can be more distinct. See **AFFINITY** and **STEP**. The situation of a step-mother is one of the most trying and critical in life. No woman should enter into it who cannot boast the prudence of Abigail, and the philosophy and fortitude of Socrates or Zeno. The *sæva noverca* has been long and often justly complained of, but the fault is sometimes on the part of the step-children.

STEPNEY (George), an English poet and statesman, descended from an ancient family at Pendigrist, in Pembrokeshire, but born at London, in 1663. He was educated at Westminster, and then sent to Trinity College, Cambridge, in 1682; where he formed a strict friendship with Charles Montague, afterwards earl of Halifax; through whose influence, after the revolution, he was nominated to several foreign embassies; as, in 1692, to the elector of Brandenburg; in 1693 to the emperor; in 1694 to the elector of Saxony; in 1696 to the electors of Mentz and Cologne, and the congress at France; and in 1696 queen Anne sent him envoy to the states-general. In all his negotiations he was very successful. He published several poems, and some political tracts; and died at Chelsea in 1707, aged only forty-four.

STEPNEY, or STEBUNHETHE, a large and ancient parish in the hundred of Ossulston, Middlesex, may be regarded as a suburb of London. It comprises the hamlets of Mile-End, Ratcliffe, Poplar, and Blackwall.

The origin of the name Stepney is very doubtful, but is supposed to have been derived from the Saxon *stæb-hyrche*, a timber-wharf; or from Stiben, a corruption of Stephen. It is bounded by the parishes of Bromley, Stratford-Bow, Hackney, Bethnal Green, Spitalfields, St. George in the East, and Shadwell; all of which, about a century since, were parts of the parish of Stepney. In the year 1794 it contained, as Mr. Lysons remarks, 'about 1530 acres of land

(exclusive of the site of buildings), of which about eighty were then arable, about fifty occupied by market gardeners, and the remainder meadow, pasture, and marshy land.' But, since that year, the increase of buildings has produced a considerable diminution in the ground appropriated to agricultural and horticultural purposes. In 1299 Edward I. held a parliament here, in the house of Henry Walleis, lord mayor of London, and gave his confirmation to the great charter. The manor of this place was formerly possessed by the bishops of London; and Roger Niger is thought to have died at the manorial residence in 1241. It passed, however, from that see to king Edward VI., by gift from the ill-fated Ridley; and, after having been granted to lord Wentworth, descended through him to Thomas, earl of Cleveland; by whose influence with the king it was endowed with a court of record, a weekly market at Ratcliffe cross, and an annual fair on Michaelmas day. Stepney manor is now vested in the family of Colebrook. Exclusive of this, the principal manor, the Domesday Survey states that the parish of Stepney contained several smaller ones; all these were held, with the exception of two, of the bishop of London, and were entitled Stepney-Huskarls, Pomfret, lord Wake's, Helles, Poplar, Cobham, Mile-End, Ewell, and Rumbalds. In 1567 a water-course, which had formerly belonged to the convent of Friars-Minors, was granted to William, marquis of Winchester, with liberty to conduct its streams to his mansion-house in London.

Opposite the present rectory house, Henry, first marquis of Worcester, possessed a large mansion in 1663, of which the gateway only remains. It afterwards devolved to the family of Mead; and in this dwelling Dr. Richard Mead was born, and commenced the practice of his profession. The church, dedicated to St. Dunstan and All Saints, is large, and consists of a chancel, nave, and two aisles, separated by columns and pointed arches. At the west end is a square tower. Tombs of several illustrious characters are to be found here, as of Sir Henry Colet, lord mayor in 1486 and 1495, the father of Dr. John Colet, who founded St. Paul's school; Sir John Berry, a distinguished officer in the reign of Charles II., by whom he was knighted; and Sir Thomas Spert, comptroller of the navy to Henry VIII., and founder of the Trinity House. The font stands on a circular pillar, surrounded by four others of a smaller size. The wall of a porch towards the northeast contains a stone, on which some verses, dated 1663, state it to have been brought from Carthage. The church-yard contains, with many other celebrated names, those of Dr. Mead and his father. A short distance to the west is an ancient wooden mansion, built, it is supposed, in 1524, by Sir Henry Colet, and leased to Thomas, earl of Essex. Another of these relics of antiquity stands on Mile-End Green, and is now let in separate apartments. This latter, with some other contiguous habitations, are held under Clare Hall, Cambridge. John Colet, before mentioned, who was vicar of Stepney, lived at the north end of White Horse Street,

Ratcliffe. Some time after his resignation, it was received by Dr. Pace, who died here in 1532, and was buried in Stepney church. This parish likewise contains several Dissenting and Methodist meeting-houses; Sion chapel; a chapel belonging to the Society of Friends in Brook Street, Ratcliffe; that formerly occupied by Mr. Brewer, and some others of recent erection.

STEPPING OFF TO MUSIC. In stepping off to music, or to the tap of the drum, it will be recollected that the word of command is the signal to lift up the left foot, and that it comes down, or is planted, the instant the tap is given, or the music completes its first note, so that the time must be invariably marked by the left foot, and not by the right, as has been practised by the guards and the artillery, until a recent regulation.

STERCORANISTÆ, STERCORARIANS, or **STERCORISTS,** from *stercus*, dung, a name which those of the Romish church anciently gave to such as held that the host was not only liable to digestion, but to all its consequences, as well as other food. See **SCOTUS**.

STERCORA'CEOUS, adj. Lat. *stercoraceus*. Belonging to or partaking of the nature of dung.

Green juicy vegetables, in a heap together, acquire a heat equal to that of a human body; then a putrid *stercoraceous* taste and odour, in taste resembling putrid flesh, and in smell human fæces.

Arbutnot on Aliments.

STERCORATION, n. s. Lat. *stercora*. The act of dunging; the act of manuring with dung.

The first help is *stercoration*: the sheep's dung is one of the best, and the next dung of kine and that of horses.

Bacon.

The exterior pulp of the fruit serves not only for the security of the seed, whilst it hangs upon the plant, but, after it is fallen upon the earth, for the *stercoration* of the soil, and promotion of the growth, though not the first germination of the seminal plant.

Ray on the Creation.

Stercoration is seasonable. *Evelyn's Kalendar.*

STERCULIA, in botany, a genus of plants belonging to the class of monœcia, and order of monodelphia; natural order thirty-eighth, tricoeæ: **MALE CAL.** quinquepartite: **COR.** none, but there are fifteen filaments: **FEMALE CAL.** quinquepartite: **COR.** none: the germen is placed on a pillar, and the **CAPS.** quinquelocular, and many seeded. There are three species; viz. 1. *S. balanghas*; 2. *S. foetida*; and 3. *S. platanifolium*; which are all foreign plants.

STERE, a denomination, or rather a radical part of a denomination, in the new system of French measures, compounded like metre, litre, gramme, &c., with myria, kilo, &c., and producing the new terms, myriastere, kilostere, hectostere, decastere, decistere, centistere, and millistere. All these are new terms for measures of wood for fuel. See **MEASURE**.

STEREOGRAPHIC PROJECTION is the projection of the circles of the sphere on the plane of some one great circle, the eye being placed in the pole of that circle. See **PROJECTION OF THE SPHERE**.

STEREOMETER, an instrument invented in France for measuring the volume of a body however irregular, without plunging it in any

liquid. If the capacity of a vessel, or the volume of air contained in that vessel, be measured when the vessel contains air only, and also when the vessel contains a body whose volume is required to be known, the volume of air ascertained by the first measurement, deducting the volume ascertained by the second will be the volume of the body itself. Again, if it be admitted as a law that the volume of any mass of air be inversely as the pressure to which it is subjected, the temperature being supposed constant, it will be easy to deduce, from the mathematical relations of quantity, the whole bulk, provided the differences between the two bulks under two known pressures be obtained by experiment. Let it be supposed, for example, that the first pressure is double the second, or, which follows as a consequence, that the second volume of the air be double the first, and that the difference be fifty cubic inches; it is evident that the first volume of the air will likewise be fifty cubic inches. The stereometer is intended to ascertain this difference at two known pressures. The instrument is a kind of funnel A B fig. 6, plate STEEL-YARD, &c. composed of a capsule A, in which the body is placed, and a tube B, as uniform in the bore as can be procured. The upper edge of the capsule is ground with emery, that it may be hermetically closed with a glass cover M slightly greased. A double scale is pasted on the tube, having two sets of graduations; one to indicate the length, and the other the capacities, as determined by experiment. When this instrument is used it must be plunged in a vessel of mercury with the tube very upright, until the mercury rises within and without to a point C of the scale. See fig. 2. The capsule is then closed with the cover, which being greased will prevent all communication between the external air and that contained within the capsule and tube. In this situation of the instrument, in which the mercury stands at the same height within and without the tube, the internal air is compressed by the weight of the atmosphere, which is known and expressed by the length of the mercury in the tube of the common barometer. The instrument is then to be elevated, taking care to keep the tube constantly in the vertical position. It is represented in this position, fig. 7, second position. The mercury descends in the tube, but not to the level of the external surface, and a column D E of mercury remains suspended in the tube, the height of which is known by the scale. The interior air is therefore less compressed than before, the increase of its volume being equal to the whole capacity of the tube from C to D, which is indicated by the second scale. It is known therefore that the pressures are in proportion to the barometrical column, and to the same column diminished by the subtraction of D E. And the bulks of the air in these two states are inversely in the same proportion; and again the difference between these bulks is the absolute quantity left void in the tube by the fall of the mercury; from which data, by an easy arithmetical process, the following rule is deduced:—Multiply the number which expresses the less pressure by that which denotes the augmentation

of capacity, and divide the product by the number which denotes the difference of the pressures. The quotient will be the bulk of the air when subject to the greater pressure. To render this more easy by an example, suppose the height of the mercury in the barometer to be seventy-eight centimetres, and the instrument being empty to be plunged in the mercury to the point C. It is then covered, and raised until the small column of mercury D E is suspended, for example, at the height of six centimetres. The internal air, which was at first compressed by a force represented by seventy-eight centimetres, is now compressed only by a force represented by 78—6, or 72, centimetres. Suppose it to be observed, at the same time, by means of the gradations of the second scale, that the capacity of the part C D of the tube which the mercury has quitted is two cubic centimetres. Then by the rule $\frac{78}{72} \times 2$ give twenty four cubical centimetres, which is the volume of the air included in the instrument when the mercury rose as high as C in the tube. The body of which the volume is to be ascertained must then be placed in the capsule, and the operation repeated. Suppose, in this case, the column of mercury suspended to be eight centimetres, when the capacity of the part C D of the tube is equal to two centimetres tube. Then the greatest pressure being denoted by seventy-eight centimetres, as before, the least will be seventy centimetres, the difference of the pressures being eight, and the difference of the volumes two cubical centimetres. Hence $\frac{78}{70} \times 2$ gives the bulk of the included air under the greatest pressure 17.5 cubic centimetres. If therefore 17.5 centimetres be taken from twenty-four centimetres, or the capacity of the instrument when empty, the difference 6.5 cubic centimetres will express the volume of the body which was introduced. And if the absolute weight of the body be multiplied by its bulk in centimetres, and divided by the absolute weight of one cubic centimetre of distilled water, the quotient will express the specific gravity of the body in the common form of the tables where distilled water is taken as unity, or the term of comparison. After this description and explanation of the use of his instrument, the author proceeds with the candor and acuteness of a philosopher to ascertain the limits of error in the result; an object seldom sufficiently attended to in the investigation of natural phenomena. From his results it appears that with the dimensions he has assumed, and the method prescribed for operating, the errors may affect the second figure. He likewise gives the formulæ by means of which the instrument itself may be made to supply the want of a barometer in ascertaining the greatest pressure. He likewise adverts to the errors which may be produced by change of temperature. To prevent these, as much as possible, the actual form of the instrument and arrangements of its auxiliary parts are settled, as in fig. 3, by which means the approach of the hand near the vessel and its tube is avoided. In this figure the vertical position of the tube is secured by the suspension of the vessel, and a perforation in the table through which the tube passes. The table itself supports the capsule in

its first position, namely, that at which the cover is required to be put on. Mr. Nicholson, from whose Journal this abstract is immediately taken, supposes, with great probability, that the author of the invention had not finished his meditations on the subject, when the memoir giving an account of it was published. If he had, says the ingenious journalist, it is likely that he would have determined his pressures, as well as the measures of bulks by weight. For it may be easily understood that if the whole instrument were set to its positions, by suspending it to one arm of a balance at H (fig. 8), the quantity of counterpoise, when in equilibrio, might be applied to determine the pressures to a degree of accuracy much greater than can be obtained by linear measurement.

STEREOMETRY, *Στερεομετρία* (of *στερεος* solid and *μετρον* measure), is that part of geometry which teaches how to find the solidity or solid contents of bodies; as globes, cylinders, cubes, vessels, ships, &c.

STEREOTOMY, (from *στερεος*, and *τομη*, section), the art or act of cutting solids, or making sections thereof, as walls and other membranes in the profiles of architecture.

STEREOTYPE PRINTING. See **PRINTING**.

STERIL, *adj.* } Fr. *sterile*; Lat. *sterilis*.

STERILITY, *n. s.* } Barren; unfruitful; not
STERILIZE, *v. a.* } productive; wanting fecundity: the noun substantive and verb corresponding.

Our elders say,
The barren, touched in this holy chace,
Shake off their *steril* curse.

Shakspeare. Julius Cæsar.

The sea marge *steril*, and rocky hard. *Id. Tempest.*

In very *steril* years, corn sown will grow to another kind.

Bacon's Natural History.

Spain is thin sown of people, by reason of the *sterility* of the soil, and because their natives are exhausted by so many employments in such vast territories.

Id. War with Spain.

To separate seeds, put them in water; such as are corrupted and *steril* swim.

Browne's Vulgar Errors.

She is grown *steril* and barren, and her births of animals are now very inconsiderable.

More against Atheism.

When the vegetative stratum was once washed off by rains, the hills would have become barren, the strata below yielding only mere *sterile* and mineral matter, such as was inept for the formation of vegetables.

Woodward.

May we not as well suppose the *sterilizing* the earth was suspended for some time, till the deluge became the executioner of it? *Id. Natural History.*

An eternal *sterility* must have possessed the world, where all things had been fastened everlastingly, with the adamantine chains of specifick gravity, if the Almighty had not said, Let the earth bring forth grass, the herb yielding seed, and the fruit-tree yielding fruit.

Bentley's Sermons.

Go! *sterilize* the fertile with thy rage. *Savage.*

He had more frequent occasion for repetition than any poet; yet one cannot ascribe this to any *sterility* of expression, but to the genius of his times, which delighted in these reiterated verses.

Pope's Essay on Homer.

STERILITY. It has been asserted by many authors that all monsters produced by a mixture of different species of animals, such as mules,

are barren; but this does not hold universally, even with the mule, which is the instance most generally adduced. See **MULE**. Sterility in women sometimes happens from a miscarriage, or violent labor, injuring some of the genital parts; but one of the most frequent causes is the suppression of the menstrual flux.—There are other causes arising from various diseases incident to those parts, by which the uterus may be unfit to receive or retain the male seed;—from the tubæ fallopianæ being too short, or having lost their erective power; in either of which cases no conception can take place;—from universal debility and relaxation; or a local debility of the genital system; by which means, the parts having lost their tone or contractile power, the semen is thrown off immediately post coitum;—from imperforation of the vagina, the uterus, or the tubæ, or from diseased ova, &c. Hence medical treatment can only avail in cases arising from topical or universal debility; in correcting irregularities of the menstrual flux, or in removing tumors, cicatrices, or constrictions of the passage, by the art of surgery.

STERIS, in botany, a genus of the dignyia order, and pentandria class of plants: *CAL.* quinquepartite: cor. wheel-shaped; the berry is unilocular, and many seeded. There is only one species, viz. *S. Javana*, a foreign plant; a native of the isle of Java.

STERLING, *adj. & n. s.* Camden derives this word from the Easterlings, or inhabitants of the Hanse towns, who were employed as coiners. An epithet by which genuine money is discriminated.

The king's treasure, that he left at his death, amounted unto eighteen hundred thousand pounds *sterling*.

Bacon.

Several of them would rather chuse to count out a sum in sesterces than in pounds *sterling*.

Addison.

This visionary various projects tries,
And knows that to be rich is to be wise:
By useful observation he can tell

The sacred charms that in true *sterling* dwell;

How gold makes a patrician of a slave,

A dwarf an Atlas, a Thersites brave. *Garth*

Great name! which in our rolls recorded stands,

Leads honours, and protects the learned bands,

Accept this offering to thy bounty due,

And Roman wealth in English *sterling* view.

C. Arbuthnot.

There is not one single witty phrase in this collection, which hath not received the stamp and approbation of one hundred years: he may therefore be secure to find them all genuine, *sterling*, and authentic.

Swift's Polite Conversation.

STERLING, among goldsmiths, is used synonymously with standard, and applied to gold and silver plate of the same degree of fineness with the sterling money of Great Britain; i. e. with a mixture of one-twelfth of copper alloy in each metal; which reduces the silver to eleven deniers, or eleven deniers two grains fineness per ounce. All goldsmiths in both kingdoms are bound to make every piece of gold or silver plate that is sold by weight of this standard or sterling fineness; and assay-masters are appointed and sworn, in the principal cities in both kingdoms, to try their work and stamp it, when found sterling (see **ASSAY-MASTER**), and to break it down, if found deficient. Trinkets not

sold by weight may be made of any degree of coarseness.

STERN, *adj. & n. s.* } Saxon *ŕejn*. Severe
STERN'AGE, *n. s.* } of countenance, aspect,
STERN'LY, *adv.* } or manners; hard; af-
STERN'NESS, *n. s.* } flictive; the adverb and
 noun substantive corresponding. The stern of a ship is from Sax. *ŕeop*, *epp*, the steering place.

Of stature huge, and eke of courage bold,
 That sons of men amazed their sternness do behold.
Spenser.

She all at once her beastly body raised
 With doubled forces high above the ground,
 Though wrapping up her wreathed stern around. *Id.*

It shall not be amiss here to present the stern but lively countenance of this so famous a man.

Knolles's History of the Turks.

I would outstare the sternest eyes that look,
 Outbrave the heart most daring on the earth,
 Pluck the young suckling cubs from the she-bear,
 Yea, mock the lion when he roars for prey,
 To win thee, lady. *Shakspeare. Merchant of Venice.*

Women are soft, mild, pitiful, and flexible;
 Thou, stern, obdurate, flinty, rough, remorseless.
Shakspeare.

If wolves had at thy gate howled that stern time,
 Thou shouldst have said, Go, porter, turn the key,
 All cruels else subscribed. *Id. King Lear.*

Did this in Cæsar seem ambitious?
 When that the poor have cried, Cæsar hath wept;
 Ambition should be made of sterner stuff.
Id. Julius Cæsar.

How would he look to see his work so noble
 Wildly bound up! or how
 Should I, in these my borrowed flaunts, behold
 The sternness of his presence! *Shakspeare.*
 Mischief stood,
 And with his stern steele drew in streames the blood.
Chapman.

No mountaine lion tore
 Two lambs so sternly. *Id.*

Gods and men
 Feared her stern frown, and she was queen of the
 woods. *Milton.*

Sternly he pronounced
 The rigid interdiction. *Id. Paradise Lost.*

Then shall the war, and stern debate, and strife
 Immortal be the business of my life;
 And in thy fame, the dusty spoils among,
 High on the burnished roof my banner should be
 hung. *Dryden.*

Yet sure thou art not, nor thy face, the same,
 Nor thy limbs moulded in so soft a frame;
 Thou look'st more sternly, dost more strongly move,
 And more of awe thou bearest, and less of love.
Id.

They turn their heads to sea, their sterns to land.
Id.

Let a barbarous Indian, who had never seen a
 ship, view the separate and disjointed parts, as the
 prow and stern, the ribs, masts, ropes, and shrouds,
 he would form but a very lame idea of it.

Watts on the Mind.

The judge supreme soon cast a stedfast eye,
 Stern, yet attemper'd with benignity. *Harte.*

The STERN is the posterior face of a ship; or that part which is represented to the view of a spectator placed on the continuation of the keel behind. It is terminated above by the taffarel, and below by the counters; it is limited on the sides by the quarter-pieces, and the intermediate space comprehends the galleries and windows of

the different cabins. See QUARTER, SHIP, and SHIP-BUILDING.

STERNA, the tern or noddy, a genus of birds arranged under the order of palmipides. The marks of this genus are a straight, slender, pointed bill; linear nostrils; a slender and sharp tongue; very long wings; a small back toe, and a forked tail. There are twenty-five species, according to Dr. Latham; viz. 1. S. Africana; 2. alba; 3. australis; 4. Boysii; 5. Caspia; 6. Cayana; 7. cinerea; 8. fessipes; 9. fuliginosa; 10. hirundo; 11. metopoleucos; 12. minuta; 13. nigra; 14. nilotica; 15. obscura; 16. panaya; 17. phillippina; 18. piscata; 19. simplex; 20. sinensis; 21. spadicea; 22. stolidi; 23. striata; 24. Surinamensis; 25. vittata. Of these only three are found in Britain; viz. 1. S. fessipes the black tern, is of a middle size between the hirundo (No. 2.) and the minuta (No. 3). The usual length is ten inches; the breadth is twenty-four; the weight two ounces and a half. The head, neck, breast, and belly, as far as the vent, are black; beyond is white; the male has a white spot under its chin; the back and wings are of a deep ash color; the tail is short and forked; the exterior feather on each side is white; the others ash colored; the legs and feet of a dusky red. Mr. Ray calls this a cloven footed gull, as the webs are depressed in the middle, and form a crescent. These birds frequent fresh waters, breed on their banks, and lay three small eggs of a deep olive color, much spotted with black. They are found during spring and summer in vast numbers in the fens of Lincolnshire, make an incessant noise, and feed on flies, as well as water insects and small fish. Birds of this species are seen very remote from land. Kalm saw flocks of hundreds in the Atlantic Ocean, midway between England and America, and a later voyager saw one 240 leagues from the Lizard in the same ocean.

2. S. hirundo, the common tern, or great sea swallow, weighs four ounces and a quarter; the length is fourteen inches; the breadth thirty; the bill and feet are of a fine crimson; the former tipped with black, straight, slender, and sharp pointed; the crown, and hind part of the head, black; the throat, and whole under side of the body, white; the upper part and coverts of the wings, a fine pale gray. The tail consists of twelve feathers; the exterior edges of the three outmost are gray, the rest white; the exterior on each side is two inches longer than the others: in flying, the bird frequently closes them together, so as to make them appear one slender feather. These birds are very common; frequent our sea-coasts and banks of lakes and rivers during summer, but are most common in the neighbourhood of the sea. They are found also in various parts of Europe and Asia, according to the season; in summer as far as Greenland and Spitzbergen, migrating in turn to the south of Austria and Greece. The female lays three or four eggs in June, of a dull olive color, an inch and three-quarters in length, marked with irregular black spots, intermixed with some others of a smaller size, and less bright; the little end is almost free from any marking. These are laid among grass or moss

The young are hatched in July, and quit the nest very soon after. They are carefully fed by their parents, and fly in about six weeks. This species appears to have all actions on the water which the swallow has on land, skimming on the surface, and seizing on every insect which comes in its way; besides which, the moment it spies a fish in the water, darts into that element, and, seizing its prey, arises as quickly to the place from which it dipped. These birds are also found in America, come into New England in May, and go away in autumn, and are called there the mackarel gull. At Hudson's Bay they are known by the name of black head. They lay their eggs in small hollows on the shore, sometimes lined with a few leaves. They are often found in great numbers on the islets in the rivers, and are thought good eating. They are bold, not fearing mankind, and in the time of incubation will attack any one, darting down so as to touch a person's hat, without his giving the least offence.

3. *S. minuta*, the smaller sea swallow (called by Linnaeus *larus minuta*), weighs only two ounces five grains, is in length eight inches and a half; in breadth nineteen and a half. The bill is yellow, tipped with black; the forehead and cheeks white; from the eyes to the bill is a black line; the top of the head and hind part black; the breast and under side of the body clothed with feathers so closely set together, and of such an exquisite rich gloss and so fine a white, that no satin can be compared to it: the back and wings of a pale gray; the tail short, less forked than that of the former, and white; the legs yellow; the irides dusky. These two species are very delicate, seem unable to bear the inclemency of the weather on our shores during winter; for they quit their breeding places at the approach of it, and do not return till spring. The manners, haunts, and food of this species are the same with those of the former; but they are far less numerous.

STERNBERG, a town of Moravia, thirteen miles N. N. E. of Olmutz. It is well built with large houses, wide streets, and a spacious square; having manufactures of woollen, linen, and canvas. It is a thriving place, and its population has for some time back increased. Inhabitants 8000. Long. 17° 13' E., lat. 49° 40' N.

STERNE (Laurence), a writer of a very peculiar cast, born at Clonmell, in the south of Ireland, 24th of November 1713. His father Roger Sterne was the grandson of Sterne archbishop of York, who has been supposed to have been the author of the excellent book entitled *The Whole Duty of Man*. Laurence inherited nothing of his grand-father's manner of writing, but rather resembled Rabelais, whose wit he carried with him even into the pulpit. In 1722 he was sent to school at Halifax in Yorkshire, where he continued till 1732, when he was removed to Jesus College in Cambridge. How long he resided in college, or what progress he made in literature or science, is not known: his works display rather native genius than profound erudition. Upon quitting the university he went to York, and, being in orders, was presented to the living of Sutton by the interest of his uncle Dr. Sterne, a prebendary of that

church. In 1741 he married, and was soon afterwards made a prebendary of York, by the interest also of his uncle, who was then upon very good terms with him; but 'quickly quarrelled with him,' he says, 'and became his bitterest enemy, because he would not be a party man, and write paragraphs in the newspapers.' By his wife's means he got the living of Stillington, but remained nearly twenty years at Sutton, doing duty at both places. He was then in very good health, which, however, soon after forsook him; and books, painting, fiddling, and shooting, were, as he tells us, his amusements. In 1760 he went to London to publish his two first volumes of *Tristram Shandy*; and was that year presented to the curacy of Coxwold. In 1762 he went to France, and two years after to Italy, for the recovery of his health; but his health never was recovered. He languished under consumption, without the slightest depression of spirits, till 1768, when he died. His friend Garrick penned these four elegant lines for his epitaph:—

Shall pride a heap of sculptored marble raise,
Some worthless, unmourned, titled fool to praise;
And shall we not by one poor grave-stone learn,
Where genius, wit, and humor, sleep with Sterne

The works of Sterne are very generally read. They consist of, 1. *The Life and Opinions of Tristram Shandy*; 2. *Sermons*; 3. *A sentimental Journey*; 4. *Letters published since his death*.

STERN FAST, a rope used to confine the stern of a ship or boat to any wharf or jetty-head, &c.

STERNHOLD (Thomas), an English poet, born in Hampshire, and educated at Wykeham's school near Winchester, about 1480. He afterwards studied at the university of Oxford, but did not graduate. He obtained the place of groom of the robes of king Henry VIII., and was left 100 marks by the will of that monarch. He enjoyed the same office under Edward VI. and was held in some esteem at court for his poetical abilities. With the honest intention of discouraging wanton songs, he turned into English metre fifty-one of the Psalms of David; the rest were executed by Hopkins; and this version of the Psalms of Sternhold and Hopkins was long so much esteemed that it was used in the English service, printed along with the book of common prayer, till Tate and Brady's more elegant version was preferred. But by the time of queen Anne, from the alteration of the language, &c., this version was become so obsolete, that Dean Swift treats these two poets with as little respect as Virgil treated Mævius and Bavius. Speaking of a bad poet of his own time, he says, 'Sternhold himself he out-sternholded.' But the dean should have made allowance for the period at which they wrote. Sternhold died at London, in 1549, with the excellent character of a zealous reformer, and a very strict moralist.

STERNO-CLEIDO MASTOIDEUS. *Sterno-mastoideus*, and *cleido-mastoideus*, of Albinus; *mastoideus* of Douglas and Cowper; and *sterno-clavio-mastoidien* of Dumas; are names of a muscle on the anterior and lateral part of the

neck, which turns the head to one side, and bends it forward. It arises by two distinct origins; the anterior tendinous and fleshy, from the top of the sternum near its junction with the clavicle; the posterior fleshy, from the upper and anterior part of the clavicle. Both unite a little above the anterior articulation of the clavicle to form one muscle, which runs obliquely upwards and outwards to be inserted by a thick strong tendon, into the mastoid process of the temporal bone which it surrounds; and, gradually becoming thinner, is inserted as far back as the lambdoidal suture.

STERNO-COSTALES. These are considered as forming a single muscle on each side of a triangular shape; hence we find the name of *triangularis* adopted by Douglas and Albinus; but Verheyen, who first taught that they ought to be described as four or five distinct muscles, gave them the name of *sterno-costales*; and in this he is very properly followed by Winslow, Haller, and Lieutaud. These muscles are situated at each side of the under surface of the sternum, upon the cartilages of the third, fourth, fifth, and sixth ribs. Their number varies in different subjects; very often there are only three, sometimes five, and even six, but most usually we find only four.

The lowermost of the *sterno-costales*, or what would be called the inferior portion of the *triangularis*, arises tendinous and fleshy from the edge and inner surface of the lower part of the *cartilago ensiformis*, where its fibres intermix with those of the *diaphragm* and *transversalis abdominis*. Its fibres run nearly in a transverse direction, and are inserted, by a broad thin tendon, into the inner surface of the cartilage of the sixth rib, and lower edge of that of the fifth. The second and largest of the *sterno-costales* arises tendinous from the *cartilago ensiformis* and lower part of the sternum laterally; and, running a little obliquely outwards, is inserted into the lower edge of the cartilage of the fifth, and sometimes of the fourth rib. The third arises tendinous from the sides of the middle part of the sternum, near the cartilages of the fourth and fifth ribs, and, ascending obliquely outwards, is inserted into the cartilage of the third rib. The fourth and uppermost, which is the most frequently wanting, arises tendinous from the beginning of the cartilage of the third rib and the adjacent part of the sternum; and, running almost perpendicularly upwards, is inserted by a thin tendon (which covers a part of the second internal intercostal) into the cartilage and beginning of the bony part of the second rib. All these muscles are more or less intermixed with one another at their origin, and this probably occasioned them to be considered as one muscle. Fallopius informs us that the plate Vesalius has given of them, was taken from a dog, in which animal they are much larger than in man. Douglas has endeavoured to account for this difference, but his explanation is far from being satisfactory. See ANATOMY.

STERNO-HYOIDEUS. This muscle, which arises from the clavicle as well as from the sternum, Winslow calls *sterno-cleido-hyoideus*. It

is a long, flat, and thin muscle, situated obliquely between the sternum and *os hyoides*, behind the lower part of the *mastoideus*, and covering the *sterno-thyroideus* and the *hyo-thyroideus*. It arises by very short tendinous fibres, from the cartilaginous part of the first rib, from the upper and inner part of the sternum, from the capsular ligament that connects that bone with the clavicle, and commonly from a small part of the clavicle itself; thence ascending along the anterior and lateral part of the neck, we see it united to its fellow, opposite to the inferior part of the larynx, by means of a thin membrane, which forms a kind of *linea alba*. After this the two muscles separate again; and, each passing over the side of the thyroid cartilage, is inserted into the basis of the *os hyoides*, immediately behind the insertion of the last described muscle. Its use is to draw the *os hyoides* downwards.

STERNOMANTIS, in antiquity, a designation given to the Delphian priestess, more usually called *Pythia*. *Sternomantis* is also used for any one that had a prophesying demon within him.

STERNON, *n. s.* Gr. *στρονον*. The breast-bone.

A soldier was shot in the breast through the *sternon*. *Wiseman*.

STERNO-THYROIDEUS, the *sterno-thyroidien* of Dumas; is flat and thin like the *sterno-hyoideus*, but longer and broader. It is situated at the fore part of the neck, between the sternum and thyroid cartilage, and behind the *sterno-hyoideus*. It arises broad and fleshy from the upper and inner part of the sternum, between the cartilages of the first and second ribs, from each of which it receives some few fibres, as well as from the clavicle, where it joins with the sternum. Thence, growing somewhat narrower, it ascends; and, passing over the thyroid gland and the cricoid cartilage, is inserted tendinous into the lower and posterior edge of the rough line of the thyroid cartilage, immediately under the insertion of the *sterno-hyoideus*. Now and then a few of its fibres pass on to the *os hyoides*. Its use is to draw the thyroid cartilage, and consequently the larynx, downwards.

STERN POST, a long straight piece of timber erected on the extremity of the keel, to sustain the rudder and terminate the ship behind. This piece ought to be well secured and supported; because the ends of all the lower planks of the ship's bottom are fixed in a channel, cut on its surface; and the whole weight of the rudder is sustained by it.

STERN-SHEETS, that part of a boat which is contained between the stern and the aftmost or hindmost seat of the rowers. It is generally furnished with benches to accommodate the passengers. See BOAT.

STERNUM (*pectoris os*). The breast-bone. The sternum, *os pectoris*, or breast-bone, is the oblong flat bone placed at the fore part of the thorax. The ossification of this bone in the fœtus beginning from many different points at the same time, we find it in young subjects composed of several bones united by cartilages; but, as we advance in life, most of these cartilages ossify, and the sternum, in the adult state.

is found to consist of three, and sometimes only of two pieces, the two lower portions being united into one; and very often, in old subjects, the whole is formed into one bone. But, even in the latter case, we may still observe the marks of its former divisions; so that, in describing the bone, we may very properly divide it into its upper, middle, and inferior portions. The upper portion forms an irregular square, which, without much reason, has by many writers been compared to the figure of a heart as it is painted on cards. It is of considerable thickness, especially at its upper part. Its anterior surface is irregular, and slightly convex; posteriorly it is somewhat concave. Its upper middle part is hollowed, to make way for the trachea. On each side, superiorly, we observe an oblong articulating surface, covered with cartilage in the recent subject, for receiving the ends of the clavicles. Immediately below this, on each side, the bone becomes thinner, and we observe a rough surface for receiving the cartilage of the first rib, and, almost close to the inferior edge of this, we find the half of such another surface, which, combined with a similar surface in the middle portion of the sternum, serves for the articulation of the cartilage of the second rib. The middle portion is much longer, narrower, and thinner than the former; but is somewhat broader and thinner below than above, where it is connected with the upper portion. The whole of its anterior surface is slightly convex, and within it is slightly concave. Its edge, on each side, affords four articulating surfaces, for the third, fourth, fifth, and sixth ribs; and parts of articulating surfaces at its upper and lower parts, for the second and seventh ribs. About the middle of this portion of the sternum we sometimes find a considerable hole, large enough in some subjects to admit the end of the little finger. Sylvius seems to have been the first who described it. Riolanus, and some others after him, have, without reason, supposed it to be more frequent in women than in men. In the recent subject it is closed by a cartilaginous substance; and, as it does not seem destined for the transmission of vessels, as some writers have asserted, we may perhaps very properly, with Hunauld, consider it as an accidental circumstance, occasioned by an interruption of the ossification, before the whole of this part of the bone is completely ossified. The third and inferior portion of the sternum is separated from the former by a line, which is seldom altogether obliterated, even in the oldest subjects. It is smaller than the other parts of the bone, and descends between the ribs, so as to have been considered as an appendix to the rest of the sternum. From its shape, and its being constantly in a state of cartilage in young subjects, it has been commonly named cartilago xiphoides, ensiformis, or sword-like cartilage; though many of the ancients gave the name of xiphoides to the whole sternum; comparing the two first bones to the handle, and this appendix to the blade of the sword. The shape of this appendix varies in different subjects; in some it is longer and more pointed, in others shorter and more obtuse. Veslingius has seen it reaching as

low as the navel, and incommoding the motion of the trunk forwards. In general it terminates obtusely, or in a single point; sometimes, however, it is bifurcated; and Eustachius and Haller have seen it trifid. Very often we find it perforated, for the transmission of branches of the mammary artery. In the adult it is usually ossified and tipped with cartilage, but it very often continues cartilaginous through life; and Haller once found it in this state in a woman who died in her 100th year. The substance of the sternum internally is of a light spongy texture, covered externally with a thin bony plate; hence it happens that this bone is easily fractured.

STERNUTATION, *n. s.* Lat. *sternutatio*. The act of sneezing.

Concerning *sternutation*, or sneezing, and the custom of saluting upon that motion, it is generally believed to derive its original from a disease wherein *sternutation* proved mortal, and such as sneezed died.

Browne's Vulgar Errors.

Physicians, in persons near death, use *sternutatories*, or such medicines as provoke unto sneezing; when, if the faculty arise, and *sternutation* ensueth, they conceive hopes of life. *Browne.*

Sternutation is a convulsive shaking of the nerves and muscles, occasioned by an irritation of those in the nostrils. *Quincy.*

STERSICHORUS, a Greek lyric poet of Sicily, born in Himera. He wrote twenty-six books on music, poetry, &c., which are all lost, except a few fragments. He flourished about A. A. C. 556, and died at Catana, aged eighty-five. His name was originally Tysias, but changed to Stersichorus, on account of his improvements on music and dancing. He was a man of rank, and distinguished as a statesman among the Sicilians.

STETTIN, a town of the Prussian States, the capital of Pomerania, is situated on the Oder, about sixty miles from the Baltic. It stands on an eminence on the left bank of the river, being here divided into four streams. Opposite to it, and connected by a long bridge over the main stream, is a part of the town called Lastadie. It has five gates and several squares. The principal public buildings are the castle, government-house, arsenal, barracks, hospitals, exchange, theatre, and public library. The majority of the inhabitants are Lutherans; and there is here an academical gymnasium, with several professors, and two assistants, who hold classes of divinity, law, medicine, as well as of philosophy, mathematics, the classical, and some modern languages. The town school has been united with this institution since 1805; here is also a navigation school. The manufactures comprise woollens, linens, cotton, leather, soap, and tobacco; but above all, ships' anchors, of which, as of ships and boats built here, there is a large export. Stettin is the great outlet for the manufactures of Silesia, and the import of colonial goods and foreign fabrics required by that province. The vessels, in general small, that visit this town annually are about 1000, of which nearly one-fourth are the property of the place. Of the exports, the leading articles are linen, corn, and timber; of the imports, coffee, sugar,

cotton, dye-woods, and wine. Stettin is a place of strength, but fell 29th of October, 1806, without resistance, into the hands of the French. It was garrisoned by them after their retreat from Russia in 1812, but obliged to capitulate in October 1813, when the Dutch troops belonging to the garrison hoisted the Orange cockade. The adjoining country, called formerly the duchy of Stettin, was ceded to Sweden by the peace of Westphalia, but seized by the Prussians in the misfortunes of the latter years of Charles XII. Eighty miles N. N. E. of Berlin. Population 20,000. Long. $14^{\circ} 45' 45''$ E., lat. $53^{\circ} 25' 36''$ N.

STETTIN, a government of the Prussian States, comprising the middle part of Pomerania, begins at the river Peene, and extends eastward to a few miles beyond the Bega. Its area is computed at 6625 square miles, and its population at 300,000. It is divided into the following thirteen circles, viz. Randow, Anclam, Demmin, Usedom, Wollin, Greifenhagen, Pyritz, Saatzig, Naugard-Daber, Flemming, Greifenberg, Osten-Blucher, and Bork.

STETTIN, NEW, a small town of Pomerania, in the government of Coslin, with 1800 inhabitants, and a gymnasium. Forty-one miles south by east of Coslin, and fourteen south by west of Baldenburg.

STEUART-Denham (Sir James), was born at Edinburgh on the 10th of October, O. S. 1713. His father was Sir James Steuart of Goodtrees, Bart., solicitor-general for Scotland; and his mother was Anne, daughter of Sir Hugh Dalrymple of North Berwick, Bart., president of the college of justice. The first rudiments of his education he received at the grammar school of North Berwick, which at his father's death he quitted, at the age of fourteen, with merely the reputation of being a good scholar. From North Berwick, Sir James was sent to the university of Edinburgh, where he continued until 1735, when he passed advocate before the Court of Session, and immediately afterwards went abroad to visit foreign countries. He was then in his twenty-third year, and had made himself well acquainted with the Roman law and history, and the municipal law of Scotland. He travelled till 1740, when he returned to Scotland, and married Lady Frances Wemyss, eldest daughter of the earl of Wemyss, in 1742. A few months after his marriage the representation of Mid-Lothian became vacant, by the member being made a lord of trade and plantations. The candidates were the late member and Sir John Baird of Newbyth. On the day of election Mr. Dundas of Arniston, one of the senators of the college of justice, was chosen preses of the meeting, and omitted to cause the name of Sir James Steuart to be called on the roll of freeholders. For this illegal use of his temporary power, Sir James commenced a suit against the president; and resuming the gown as an advocate, he pleaded his own cause with great energy and eloquence, and with the applause of the bench, the bar, and the public. This called lord Arniston from the bench to plead his own defence at the bar; and Sir James could not have been opposed to an antagonist better qualified to call forth all his powers; for that judge is talked of

at this day in Edinburgh as the profoundest lawyer and the ablest pleader that ever graced the Scottish bench or the Scottish bar. With the issue of this contest we are not acquainted; but it drew upon Sir James Steuart very general attention, and convinced the public that had he continued at the bar he must have risen rapidly to the head of his profession. On his travels, however, he had contracted friendships with lord Marischal, and other eminent men, attached to the pretensions of the royal family of Stuart, and had received flattering attentions from the pretender to the British throne; the impressions arising from which, added to the irritations of the controversy with the powerful party in Scotland attached to the court, led him, unadvisedly, into connexions with the movers of the rebellion in 1745. As he was by far the ablest man of their party, the Jacobites engaged him to write the prince regent's manifesto, and to assist in his councils. Information having been given of his participation in these affairs, he thought it prudent, on the abortion of this unhappy attempt, to leave Britain; and by the zeal it is said of Arniston he was excepted afterwards from the bill of indemnity, and rendered an exile from his country. He chose France for his residence during the first ten years of his banishment, and was chiefly at Angoulesme, where he superintended the education of his son; thence he went to Tubingen in Suabia, for the benefit of its university, in prosecution of the same laudable design; but in the end of the war, 1756, having been suspected by the court of Versailles of communicating intelligence to the court of London, he was seized at Spa, and kept some time in confinement; from which being liberated, after the accession of the late king of Great Britain, he came by toleration to England, and resided at London, where he put the last hand to his System of Political Economy, the copyright of which he sold to Andrew Millar; and, being permitted to dedicate this work to the king, he applied for a *noli prosequi*, which, after some malicious objections, he obtained, and had the comfort of returning to his family estate in Scotland. Having nothing professional to do, during his long residence in France, the active mind of Sir James was occupied in study. His book on the Principles of Political Economy contains most of the fruits of it. In the beginning of 1755 Sir James wrote his Apology or Defence of Sir Isaac Newton's Chronology, which at that time he intended to publish, but was prevented by other engagements. It was communicated to several persons of eminence in France and Germany in MS., and produced, in December that year, in the *Mercure de France*, an answer from M. Deshoulières; to which Sir James soon after replied. The great Newton, applying astronomical and statistical principles to the ancient chronology of Greece, had chastised the vanity of nations, and arrested the progress of infidelity in delineating the history of the world. Lost in the confusion of excessive pretensions to an antiquity beyond all measure, and disgusted by the superstitious aids that were assumed to support these pretensions among ancient nations, the

revivers of learning in Europe, during the last and the preceding century, turmoiled themselves with controversies between the comparative merits of the ancients and moderns; and the abettors of the latter, entrenching themselves behind the falsehoods of the ancients, on the scope of their remote history, gave the lie to all antiquity, and in despair plunged themselves into the ocean of scepticism. Happy had it been for society if this scepticism had confined itself to the history of ancient nations in general; but the same spirit, taking disgust at the horrors of Christian ambition and bigotry, and contemplating with derision the ridiculous legends of modern miracles, gave the lie to all religious scripture of the Jews and Christians, and attempted to banish divine intelligence, the superintending providence of Deity, and the true dignity of the human species, from the face of the earth! It was a noble undertaking, therefore, in Sir James, to attempt to disperse this mist of error by dispassionately and scientifically explaining and supporting the chronology of Sir Isaac Newton. He has done it with great precision and effect; and it is a book well worth the perusal of those who wish to read ancient history with improvement, or to prevent themselves from being bewildered in the mazes of modern conjecture. It was printed in 4to. at Frankfort on the Maine, for John Bernard Eichemberg the Elder, in 1757. In 1758 and 1759 the British House of Commons took up the consideration of a statute to regulate a general uniformity of weights and measures throughout the united kingdoms, which had been so often unsuccessfully attempted. This called the attention of Sir James not only to the investigation of the particular subject that engaged that of the House of Commons, but to devise a method of rendering a uniformity of weights and measures universal. He thought the cause of former disappointments in this useful pursuit had been the mistaken notion that one or other of our present measures should be adopted for the new standard. After the plan had been relinquished by the parliament of England he digested his note and observations on this important disquisition into the form of an epistolary dissertation, which he transmitted to his friend lord Barrington, and resolved, if there had been a congress assembled, as was once proposed, to adjust the preliminaries of the general peace in 1763, to have laid his plan before the ministers of the different nations, who were to prepare that salutary pacification of the contending powers. This epistolary dissertation Sir J. afterwards reduced at Coltness, in 1777, into a form more proper for the public eye, and sent a corrected copy to a friend, reserving another for the press, which was printed in 1790 for Stockdale in Piccadilly. In this tract the author shows, from the ineffectual attempts that have been made to alter partially, by innovation, the standards of measures or weights, that the effectual plan to be adopted is to depart entirely from every measure whatsoever now known, and to take, ad libitum, some new mass instead of our pound, some new length instead of our ell, some new space instead of our acre, and some new solid instead of our gallon and bushel. For

this purpose Sir James proposes as the unit a mass to be verified with the greatest possible accuracy, equal in weight to 10,000 grs. Troy. The pendulum, as it swings at London, to beat seconds of time, he proposes to be the measure of length; and, after having laid down his fundamental principles, he proposes an ingenious plan for rendering their adoption universal through the whole world. Having obtained his pardon, Sir James Steuart retired to Coltness, in the county of Lanark, the paternal estate of his family, where he turned his attention to the improvement of his neighbourhood by public works and police, and drew the first good plan for a turnpike bill, suited to the circumstances of Scotland, which has been since generally adopted. He repaired his house, planted, improved, and decorated his estate, and in social intercourse rendered himself the delight of his neighbourhood and country. He was engaged by the directors of the East India Company of England to digest a code for the regulation of the current coin of Bengal; the plan for which important regulation he printed, and received from the court of directors a handsome diamond ring as a mark of their approbation. He prepared for the press, but never published, an antidote to the *Système de la Nature* by Mirabeau, wherein the parallelisms and foolish reasoning of that infidel work are examined, detected, and confuted. It is written in French; and, were the works of Mirabeau worth refutation, it might be printed with much advantage to Sir James's reputation as a controversial writer. This great and good man died in November 1780, and was buried at Cambusnethan, in Lanarkshire, on the 28th; the duke of Hamilton and his neighbours performing the last offices to the remains of their highly valued friend, and bedewing his ashes with their tears. For this short sketch of the principal events of the life of Sir James Steuart Denham we are indebted to the direct communications of his nephew, the earl of Buchan, to the *Encyclopædia Perthensis*.

STEUARTIA, in botany, a genus of the polyandria order, and monodelphia class of plants; natural order thirty-seventh, columniferæ: *CAL.* simple, with a quinquefid stigma; the apple is without juice, quinquelobed, monospermous, bursting open with a spring five ways. There is only one species, viz. *S. malacadendron*, which is a foreign plant.

STEBEN, a county of the United States, in New York, bounded north by Ontario county, east by Seneca Lake and Tioga county, south by Pennsylvania, and west by Allegany county. Chief town, Bath.

STEBENVILLE, a post town of the United States, the capital of Jefferson county, Ohio, situated on the Ohio. It is a very flourishing town, regularly laid out, having three churches, an academy, two banks, a market-house, a woollen manufactory, the machinery of which is put in motion by a steam engine; a steam paper-mill; a flour-mill and cotton manufactory, driven by steam power; a printing office, from which is issued a weekly newspaper; an air foundry, twenty-seven mercantile stores, and sixteen public inns. The progress of this place has been

uncommonly rapid. In 1805 there were scarcely any houses where this town now stands. Sixty-nine miles by the river below Pittsburgh, thirty-eight by land; 109 above Marietta, twenty-five north-east of St. Clairsville, and 150 east by north of Columbus. Population, in 1810, 800; and, in 1817, 2032.

STEVEN, *n. s.* Sax. *stæpen*. A cry; loud clamor.

Ne sooner was out, but swifter than thought,
Fast by the hide the wolf Lowder caught;
And had not Roffy renne to the *stevēn*,
Lowder had been slaid thilke same even. *Spenser*.

STEVENAGE, a market-town and parish in Broadwater hundred, Herts, twelve miles north from Hatfield, and thirty-one north-west from London. It was anciently called Stigenhaght, and belonged to the abbey of Westminster, but at the dissolution it was granted to the bishops of London, who have enjoyed it ever since. The town consists of one large street, and several small ones, indifferently built; the church is an ancient building, and consists of one isle on each side, with a large chancel in the middle, and has a square tower. To the south of the town are six hills, supposed to have been the site of a Danish or Roman camp. Here is an alms-house, called All-Christian-Souls'-House, and a grammar free-school. Market on Wednesday. Fairs nine days before Easter and Whitsun-weeks, July 15th, and the first Friday in September.

STEVENSON (Alexander), an ingenious English architect, who is said to have erected more stone bridges and other buildings in water than any other person in Britain. The aqueduct over the Lune at Lancaster, the bridge over the Liffey at Dublin, and the locks and docks on the Grand Canal of Ireland, are monuments of his professional skill. He died at an advanced age in 1796.

STEVENS (George Alexander), a poet and actor, born in London. Having spent some of his early years from inclination or necessity with itinerant companies of players, he at length procured an engagement at Covent Garden Theatre, but his performances were not admired. After living in every kind of dissipation, generally necessitous, and sometimes extravagant, he at length hit upon a measure by which he acquired independence. He composed a strange medley of humor and satire, sense and nonsense, wit and ribaldry, adapted to his own powers of performance, which is called *A Lecture upon Heads*, and read to crowded audiences; at the same time exhibiting caricatures of the different heads, as he entered upon every new character of the lawyer, parson, statesman, politician, miser, spendthrift, &c. With this medley he travelled through England, and part of Scotland, and, from the novelty of the exhibition, was so uncommonly successful that he acquired a fortune sufficient to afford him a comfortable retreat in his old age. He wrote a novel in 2 vols., entitled *The Adventures of Tom Fool*, and some poems and dramatic pieces; and died in 1784.

STEVENS, or STEPHENS (captain John), an English antiquary, born in the seventeenth century, and educated a Roman Catholic. His religion led him to follow the fortunes of James II.,

in whose service he accepted a commission, and accompanied him to Ireland. He compiled a Dictionary of the Spanish Language, and continued Sir William Dugdale's *Monasticum Anglicanum*. See DUGDALE. He died in 1726.

STEVENS (William), esq., of Broad Street, in the city of London, hosier, and many years treasurer of Queen Anne's bounty, was born in Southwark on the 2d March 1732. His father was a tradesman, and died while Mr. Stevens and a sister, the only issue of the marriage, were infants. His mother, who was the late bishop Horne's paternal aunt, removed after her husband's death to Maidstone, to be near her brother's family. At the school of Maidstone Mr. Stevens was educated along with his cousin, under the Rev. Deodotus Bye. When Mr. Horne went to Oxford, to complete his studies, Mr. Stevens was at the same period, in August 1746, placed out as an apprentice with Mr. Hookham, of No. 68 Old Broad Street (in which house from that time forth he lived and died), an eminent wholesale hosier, and a most respectable man. Of Mr. Stevens's progress in business we shall say nothing. It led him to respectability and independence. But in this he has been equalled and surpassed by thousands. In his literary attainments, in the soundness of his principles, and in the unaffected purity of his manners, he has been equalled by few, and surpassed by still fewer, even of the learned professions and of the sacred order. He corresponded regularly with his cousin the Oxonian, who informed him of the studies in which he was engaged; and Mr. Stevens spent all his leisure time in the acquisition, by his own labor and industry, of those stores which his cousin was acquiring under happier auspices. He acquired a complete knowledge of the learned languages; and, though a layman, he became particularly eminent as a theologian, and intimately acquainted with the most eminent churchmen of his day. Being an excellent Hebrew scholar he became a great admirer of the works of John Hutchinsson, whose principles he warmly espoused through life. In the year 1773 he published, anonymously, *An Essay on the Nature and Constitution of the Christian Church*, by a Layman; which has been highly esteemed. He soon after published *Cursory Observations*, on the attempt to alter the articles and liturgy. In 1776 he published *A Discourse on the English Constitution*, &c. In 1777 he published two distinct works, in answer to two sermons (on the principles of the Revolution 1688), preached by bishop Watson before the university of Cambridge. Previous to these political discussions he published *A New and Faithful Translation of Letters from M. l'Abbé de ———*, Hebrew professor in the university of ———, to the Rev. Benj. Kennicott, &c. This we believe, notwithstanding the title, was an original work of his own. In the year 1800 Mr. Stevens was induced by his numerous friends to collect and publish his works together. He did so with the title of *Ουδενος εργα*, the Works of Nobody, by which humble name he was known among his friends for upwards of twenty years. In the preface to the second edition of Jones's life of Horne, the author

has introduced a defence of the Hutchinsonian divines of the church of England, which was somewhat severely criticised in the British Critic, February 1800. Mr. Stevens, under the name of Ain, the Hebrew word for Nobody, published A Review of the Review of a new Preface to the Second Edition of Jones's Life of Horne. The last literary work in which he engaged was a uniform edition of the works of Mr. Jones of Nayland, in 12 vols., 8vo., to which he prefixed a life of the venerable author, composed in such a style of artless and pathetic religious eloquence, as did no less honour to the deceased than to the head and heart of the affectionate writer. It is impossible not to perceive the striking resemblance between Isaac WALTON (see that article) and William Stevens. Both were tradesmen. Both were men of reading. Both were divines. Both were sincere Christians and zealous churchmen; and at the same time of the utmost cheerfulness of disposition. Both were the companions and friends of the most eminent prelates and divines that adorned the church of England. Both of them wrote at an advanced period of life, and in a style of artless simplicity remarkably similar. Stevens's Life of Jones was written, says his biographer, in his seventieth year, with great intellectual ability: and he may justly be denominated the Isaac Walton of the eighteenth century. We could fill many pages in detailing the worth of this amiable man. His charities were particularly remarkable, and in general were equally varied, extensive, and judicious. In his private books of account he had three heads of Clericus, Pauper, and Gifts, to which he regularly devoted certain proportions of his income, with large additions under each head when unforeseen demands (as was frequently the case) seemed to require more than the usual proportion. In one year it was accidentally discovered that Mr. Stevens's personal expenses amounted to £300 sterling, 'while the aggregate of clericus, pauper, and gifts, considerably exceeded £600 sterling; the whole income in that year amounting to £1200 sterling.' Much, equally or more extraordinary, on this head, might easily be added; while every thing was done with the most admirable delicacy, with the most unassuming modesty, and without ostentation. This amiable man, this admirable Christian, died suddenly in the beginning of February 1807, and was buried on the 14th, by his own desire, in the church yard of Otiam Church, Kent; in repairing and adorning which he had laid out £600 sterling. 'Mark the perfect man, and behold the upright; for the end of that man is peace.'

STEVENSON (Sir John), musical composer, was a native of Ireland, and being admitted into the choir of St. Patrick's Cathedral, in the city of Dublin, under the tuition of Dr. Doyle, soon gave promise of what he lived to realize in the most successful manner. At an early age he was elected a Vicar Choral, and afterwards Doctor of Music. He obtained prize medals, and ornamental pieces of plate for glees, that displayed the utmost power and extent of harmonic science. His first dramatic music was composed for O'Keefe's "Agreeable Surprise." His church

music is of a high and sublime character. His glees and songs are numerous, popular, and beautiful. The best known and most admired of his operas, are Love in a Blaze, The Bedouins, or Arabs of the Desert—The Swiss Patriot—Spanish Patriots—and The Burning of Moscow. He had the good fortune to have his sacred music introduced to the public by his friend Dr. Spray, perhaps the finest cathedral singer that has been known in any age; and the advantage of being associated with Moore, in the publication of the Irish Melodies. After a life passed honourably and beneficially to his country, he expired at an advanced age, at the seat of his son-in-law, the Marquis of Headfort, in the county of Meath, Ireland, in Sept., 1833.

STEVERS (Palmedes), an eminent painter born at London in 1607, but his father was a Fleming. He studied painting at Delft, and acquired great excellence in representing camps and battles. His paintings are scarce. He died in 1638.

STEVERS (Anthony), brother of Palmedes, was also a good painter of portraits, conversations, &c. He died in 1680.

STEVIN, or STEVINUS (Simon), a celebrated Dutch mathematician and engineer, was born at Bruges about 1560. He invented the sailing chariots made in Holland. He published an excellent System of Mathematics in 1598 (see STATICS), and wrote several other mathematical works in Dutch; which Snellius translated into Latin, and published in 2 vols., folio. He died in 1633.

STEW, *v. a.* Fr. *estuver*. To settle any thing in a slow moist heat, with little water.

Ere I was risen from the place that showed
My duty kneeling, came a reeking post,
Stewed in his haste, half breathless.

Shakspeare. *King Lear*

STEW, *n. s.* Fr. *estuve*; Ital. *stufa*; Span *estufa*. A stove bath; a bagnio; a hot house.

As burning Ætna from his boiling stew
Doth belch out flames, and rocks in pieces broke,

And ragged ribs of mountains molten new,
Enwrapt in coal-black clouds and filthy smoke.

Spenser.

I have seen corruption boil and bubble,
Till it o'er-run the stew.

Shakspeare.

STEWARD, *n. s.* } Sax. *steward*. One
STEWARDSHIP. } who manages the affairs
of another; one who has charge of an establishment or place; a state officer: the other noun substantive corresponding.

There sat yclad in red
Down to the ground a comely personage,
That in his hand a white rod managed;
He steward was, high diet, ripe of age,
And in demeanour sober, and in council sage.

Spenser.

The duke of Suffolk is the first, and claims
To be high steward.

Shakspeare.

Take on you the charge
And kingly government of this your land:
Not as protector, steward, substitute,
Or lowly factor for another's gain.

Shakspeare. *Richard III.*

If they are not employed to such purposes, we are false to our trust, and the *stewardship* committed to us, and shall be one day severely accountable to God for it.

Calamy's Sermons.

What can be a greater honour than to be chosen one of the *stewards* and dispensers of God's bounty to mankind? What can give a generous spirit more complacency than to consider that great numbers owe to him, under God, their subsistence, and the good conduct of their lives? *Swift.*

Just *steward* of the bounty he received,
And dying poorer than the poor relieved. *Harte.*

STEWARD, an officer in a ship of war, appointed by the purser to distribute the different species of provisions to the officers and crew; for which purpose he is furnished with a mate and proper assistants.

STEWARD, LORD HIGH, OF ENGLAND, the greatest officer under the crown, an office that was anciently the inheritance of the earls of Leicester, till forfeited by Simon de Mountfort to king Henry III. But the power of this officer is so very great that it has not been judged safe to trust it any longer in the hands of a subject, excepting only *pro hac vice*, occasionally: as to officiate at a coronation, at the arraignment of a nobleman for high treason, or the like. During his office the steward bears a white staff in his hand; and the trial, &c., ended, he breaks the staff, and with it his commission expires.

STEWARD, LORD HIGH, OF GREAT BRITAIN, COURT OF THE, is a court instituted for the trial of peers indicted for treason or felony, or for misprision of either. The office of this great magistrate is very ancient, and was formerly hereditary, or at least held for life, or *dum bene se gesserit*: but now it is usually, and has been for many centuries past, granted *pro hac vice* only; and it has been the constant practice (and therefore seems now to have become necessary) to grant it to a lord of parliament, else he is incapable to try such delinquent peer. When such an indictment is therefore found by a grand jury of freeholders in the king's bench, or at the assizes before the justices of oyer and terminer, it is to be removed by a writ of *certiorari* into the court of the lord high steward, which is the only power to determine it. A peer may plead a pardon before the court of king's bench, and the judges have power to allow it, to prevent the trouble of appointing a high steward merely for the purpose of receiving such plea: but he may not plead in that inferior court any other plea as guilty or not guilty of the indictment, but only in this court; because, in consequence of such plea, it is possible that judgment of death might be awarded against him. The king, therefore, in case a peer be indicted of treason, felony, or misprision, creates a lord high steward *pro hac vice* by commission under the great seal; which recites the indictment so found, and gives his grace power to receive and try it *secundum legem et consuetudinem Angliæ*. Then when the indictment is regularly removed by writ of *certiorari*, commanding the inferior court to certify it up to him, the lord high steward directs a precept to a sergeant at arms, to summon the lords to attend and try the indicted peer. This precept was formerly issued to summon only

eighteen or twenty selected from the body of the peers; then the number came to be indefinite; and the custom was for the lord high steward to summon as many as he thought proper (but of late years not fewer than twenty-three); and that those lords only should sit upon the trial; which threw a monstrous weight of power into the hands of the crown and this its great officer, of selecting only such peers as the then predominant party should most approve of. And, accordingly, when the earl of Clarendon fell into disgrace with Charles II., there was a design formed to prorogue the parliament, to try him by a select number of peers; it being doubted whether the whole house could be induced to fall in with the views of the court. But now, by stat. 7 W. III. c. 3, upon all trials of peers for treason or misprision, all the peers who have a right to sit and vote in parliament shall be summoned at least twenty days before such trial to appear and vote therein; and every lord appearing shall vote in the trial of such peer, first taking the oaths of allegiance and supremacy, and subscribing the declaration against popery. During the session of parliament the trial of an indicted peer is not properly in the court of the lord high steward, but before the court last mentioned of our lord the king in parliament. It is true a lord high steward is always appointed in that case to regulate and add weight to the proceedings: but he is rather in the nature of a speaker *pro tempore*, or chairman of the court, than the judge of it; for the collective body of the peers are therein the judges both of law and fact, and the high-steward has a vote with the rest in right of his peerage. But in the court of the lord high-steward, which is held in the recess of parliament, he is the sole judge of matters of law, as the lords triers are in matters of fact; and, as they may not interfere with him in regulating the proceedings of the court, so he has no right to intermix with them in giving any vote upon the trial. Therefore upon the conviction and attainer of a peer for murder in full parliament, it hath been holden by the judges, that, in case the day appointed in the judgment for execution should lapse before execution done, a new time of execution may be appointed by either the high court of parliament during its sitting, though no high steward be existing, or in the recess of parliament by the court of king's bench, the record being removed into that court. It has been a point of controversy whether the bishops have now a right to sit in the court of the lord high steward and to try the indictments of treason and misprision. But Blackstone decides it in the negative, and says, 'What makes their exclusion more reasonable is, that they have no right to be tried themselves in the court of the lord high steward, and therefore surely ought not to be judges there. For the privilege of being thus tried depends upon nobility of blood rather than a seat in the house, as appears from the trials of popish lords, of lords under age, and (since the union) of the Scottish nobility, though not in the number of the sixteen; and from the trials of females, such as the queen consort or dowager, and of all peeresses by birth; and peeresses by marriage also, unless they have, when dowagers, disparaged

themselves by taking a commoner to their second husband.'

STEWART OF THE KING'S HOUSEHOLD, a lord, who is the chief officer of the king's court, has the care of the king's house, and authority over all the officers and servants of the household, except such as belong to the chapel, chamber, and stable.

STEWART, STUART, or STEUART, the surname of the royal family of Scotland, from A. D. 1371, when Robert II., but first of the name of Stewart, succeeded king David Bruce, till 1714, when the protestant royal line of that house ended by the death of queen Anne, and the accession of the house of Hanover took place in the person of her second cousin king George I. During that period of 345 years it furnished eight monarchs to Scotland, or nine, reckoning lord Darnley, and six to Great Britain. Of these three were murdered, two killed in battle, two died of grief, two were ignominiously and unjustly executed on a scaffold, and one was justly deposed and expelled for his bigotry and tyranny. In short, a more unfortunate family has hardly reigned in any nation; and yet the majority of them were well-meaning monarchs; some of them learned, most of them brave, and many of them seemed to merit a better fate.

STEWART (Walter), the founder of the house of Stewart, was the son of Fleance, by a daughter of Lewellyn, prince of Wales, and grandson of Banquo, thane of Lochaber, who was murdered by Macbeth. See SCOTLAND. Walter acquired the surname of Stewart from his office, being appointed lord high steward of Scotland.

STEWART (princess Elizabeth), daughter of king James I. of England, and VI. of Scotland, wife of prince Frederick, elector palatine of the Rhine, mother of prince Rupert, and princess Sophia, electress of Hanover, by whom she became grandmother of king George I. She, and her husband and family, suffered much for their attachment to the protestant religion; but in the course of Providence their losses have been amply made up to their posterity.

STEWART (Dr. Matthew), an eminent mathematician, was born in 1717 at Rothsay in the isle of Bute, of which parish his father was minister. Being intended for the church, he was in 1734 received as a student into the University of Glasgow. There he had the happiness of having for his preceptors the celebrated professors Hutcheson and Simson, until, wishing to remove to Edinburgh, he was introduced by Dr. Simson to Mr. Maclaurin. Mr. Stewart, however, had acquired from his intimacy with Dr. Simson a great predilection for the ancient geometry; and while the second invention of porisms, to which more genius was perhaps required than to the first discovery of them, employed Dr. Simson, Mr. Stewart pursued the same subject in a new and different direction. In doing so, he was led to the discovery of those curious and interesting propositions which were published under the title of *General Theorems* in 1746. He had before this period entered into the church; and obtained, through the patronage of the duke of Argyll and the

earl of Bute, the living of Roseneath. But in 1747 he was elected to the mathematical chair in the University of Edinburgh, which had become vacant by the death of Mr. Maclaurin. The duties of his office gave a new turn to his pursuits, and this solution of Kepler's problem, which appeared in the second volume of the *Essays of the Philosophical Society of Edinburgh* for 1756, was the first specimen of this kind which he gave to the world; it was impossible to have produced one more to the credit of the method he followed. In the first volume of the same collection there are some other propositions of Mr. Stewart's, which are an extension of a curious theorem in the fourth book of Pappus. The prosecution of the plan which he had formed of introducing into the higher parts of mixed mathematics the strict and simple form of ancient demonstration, produced the *Tracts Physical and Mathematical*, published in 1761, and the *Essay on the Sun's Distance*, in 1763: but in this last work it is acknowledged that he employed geometry on a task which geometry cannot perform. The investigation, however, is every where elegant, and will probably be long regarded as a specimen of the most arduous enquiry which has been attempted by mere geometry. The *Sun's Distance* was the last work which Dr. Stewart published; and, though he lived to see several animadversions on it made public, he declined entering into any controversy. A few months before this he gave to the world another work, entitled *Propositiones Geometricæ, More Veterum Demonstratæ*. It consists of a series of geometrical theorems, mostly new; investigated first by analysis, and afterwards synthetically demonstrated by the inversion of that analysis. Dr. Stewart's health beginning to decline, and the duties of his office becoming burdensome to him, he retired in 1772 into the country, and never resumed his labors in the university, though mathematics continued to be his chief amusement till a very few years before his death, which took place on the 23d January 1785, at the age of sixty-eight.

STEWART (Dugald), esq., professor of moral philosophy in the university of Edinburgh, was the only son of the above Dr. Matthew Stewart who survived the period of infancy. He was born in the college of Edinburgh November 22d, 1753, and, being of feeble constitution, his education was long committed to the sole and admirable management of his mother.

At seven years of age, however, he entered the High School, and acquitted himself with great credit in his classical studies. Under such a mathematician as his father he could not fail to attain a respectable knowledge of the exact sciences; but we find him, on his mother's death, in 1771, removing to the university of Glasgow to avail himself of the tuition of Dr. Reid, who was then illustrating in that city those great principles of metaphysical science to which Mr. Stewart became afterwards so much attached. On attaining his majority he was nominated assistant to his father, and continued to conduct the mathematical studies of the university of Edinburgh until the death of that honored parent. In 1778 he first attempted

to read a course of lectures in the moral philosophy class of the university, during the temporary absence of Dr. Ferguson; and when his father died, in 1785, he effected an exchange with Dr. F., who retired on the salary of the mathematical professor, while Mr. Stewart undertook to preside permanently over the moral philosophy class. In 1792 he first appeared as an author, in the publication of his introductory volume on the Philosophy of the Human Mind; this was succeeded in the following year by his *Outlines of Moral Philosophy*, and from about the same period to 1796 he read at meetings of the Royal Society of Edinburgh biographical sketches of the lives of Dr. Adam Smith, Dr. Robertson, and Dr. Reid.

These were his only known writings, until in 1810 appeared his volume of *Philosophical Essays*; in 1813 he published the second volume of his *Philosophy of the Mind*, and his admirable *Preliminary Essay to the Supplement of the Encyclopædia Britannica*; in 1827 a continuation of the second part of the philosophy; and finally, in 1828, at the age of seventy-five, the third volume, on the *Active and Moral Powers of Man*. Mr. Stewart was twice most happily married, but left no children. His oratorical powers are said to have been as remarkable as the eloquence of his written style; and he had the honor of training as his private pupils, at different periods of his life, some of the most celebrated statesmen and parliamentary orators of modern times. We need only mention the late lord Ashburton, the present marquis of Lansdowne, earl Dudley, and lord Palmerston; much regretting that our limits forbid us to enlarge the present sketch of the life of so distinguished a philosopher and amiable and excellent a man. Mr. Stewart died at Edinburgh, 11th. of June, 1828, having suffered by rather a severe stroke of palsy ever since the year 1822.

STEWART (the Hon. Admiral Keith), a late brave British naval officer, only brother of the earl of Galloway, was born in 1739. He was appointed a captain in the royal navy in 1762; commanded the *Berwick* of seventy-four guns, with a commodore's broad pendant, at the action of the *Dogger Bank*, in 1781; and the *Cambridge* in lord Howe's squadron, sent to the relief of Gibraltar in 1782. He represented the county of Wigton in four successive parliaments. He married Miss D'Aquilar, a Jewess, by whom he got a fortune, and left issue. He was afterwards raised to be vice admiral of the white, and was appointed receiver-general of the land-rents in Scotland. Like many other great men he was addicted to deep gaming; but, though often successful, did not increase his fortune by it. He died at Glasserton, in Wigtonshire, on the 5th March 1795, aged fifty-six.

STEWART (John), called Walking Stewart, from his pedestrian feats, was a late eccentric individual, who in the course of a long life wandered on foot over the greater part of the globe. He was born in Bond Street, and, having received the rudiments of education at the Charterhouse, was sent out in 1763 as a writer to Madras. In this situation he remained not quite two years.

Smitten with a strong inclination to travel, he prosecuted his route over Hindostan, walking to Delhi, Persepolis, and other parts of Persia, to Abyssinia and to Nubia. In the Carnatic he obtained the favor of the then nawaub, who made him his private secretary, and to this circumstance he owed his support in his latter days, the British house of Commons voting him £15,000, some little time before his death, in liquidation of his demands upon the nawaub. Quitting the service of this prince, he set out to walk to Seringapatam, where he was arrested by Tipoo Saib, who compelled him to enter his army, and bestowed on him a commission as captain of sepoy. While serving in this capacity he was wounded in the arm. He did not succeed in quitting the situation in which he was thus placed, till the exertions of Sir James Sibbald, the commissioner for settling the terms of peace between the presidency and the sultan, procured his liberation. Mr. Stewart now started to walk to Europe, crossing the desert of Arabia, and arriving at length safely at Marseilles. Thence he proceeded through France and Spain. Having walked through England, Scotland, and Ireland, he crossed the Atlantic, and perambulated the United States of America. In the course of his migrations he was of course frequently exposed to dangers, and once, on crossing from Ireland, narrowly escaped shipwreck; in anticipation of which he entreated earnestly the crew, in case they should survive him, to take care of a MS. he then intended to publish, which he called his *Opus Maximum*. This, if kept with any care, must be a curious journal. The last ten years of his life were passed in the vicinity of Charing Cross, London, that he might be, to use his own expression, 'in the full tide of human existence.' He died at his house in Northumberland Street, the 20th of February, 1822.

STEWARTOWN, a pleasant and thriving town of Scotland, on the Annock water, in the district of Cunninghame, in Ayrshire. It is the seat of an extensive parish; the chief manufactures are bonnet-making, for which it has long been famed, and other branches of weaving. Four miles north by west of Kilmarnock, and eight north-east of Irvine.

STEWARTRY (from Stewart, a magistrate in Scotland), a term anciently used synonymously with county or shire, and still applied in the same sense to the counties of Kircudbright or Galloway, and of Orkney and Zetland.

STEYER, a town of Upper Austria, the chief place of the circle of the Traun, situated at the confluence of the rivers Steyer and Enns. It is a neat place, of considerable size, being about three miles in circumference, and has a number of country seats in the environs. The town has some manufacturing establishments of cottons and woollens; but they are insignificant when compared with those of iron, which are said to give employment to above 12,000 men in the town and neighbourhood. The largest establishment is a manufactory of fire arms and cutlery, for account of government. Steyer was originally a castle, built about the end of the tenth century, to check the inroads of the Magyars. On the expulsion of that horde from the Austrian states,

houses were built round the castle, so as at last to form a town, which was for some time the capital of a duchy, and gave name to the province of Styria. Steyer has suffered repeatedly from fires. Inhabitants 10,000. Ninety-two miles west by south of Vienna, and sixteen S. S. E. of Lintz.

STEYNING, a post and market-town in Steyning hundred, rape of Bramber, Sussex, fifteen miles west from Lewes, and fifty-one south by west from London. This town consists of four streets, poorly built: it is chiefly noted for its church, which is a small but curious Norman built structure. The tower is more modern. In this church were buried St. Cuthman, and Ethelwolf, king of Wessex, father of Alfred. Its name is supposed to be derived from a Roman way, called Steene street, running from Arundel to Dorking, in Surry. It was anciently a borough, and sent two members to parliament; the number of voters being about 100. The returning officer was the constable; he is chief magistrate, and annually chosen at the court-leet of the lord of the manor. Here is a free school and extensive barracks for infantry. Market on Wednesday, and on the second Wednesday in every month for cattle. Fairs June 9th, September 19th, and October 10th. The Michaelmas fair is very considerable for Welsh and other cattle, sheep, hogs, and seed wheat.

STHENELUS, in fabulous history, the son of Perseus and Andromeda, king of Mycenæ. He married Nicippe, the daughter of Pelops, by whom he had Eurystheus and two daughters. See **EURYSTHEUS**. Sthenelus made war against Amphitryon, king of Argos, because he had accidentally killed his father-in-law Electryon, Sthenelus's brother, and took him prisoner. And, according to the poets, it was during this war that Jupiter put on the appearance of Amphitryon, and went to his wife Alcmena. See **ALCENA**.

STHENIC (from *σθενος*, strength), of or belonging to, or arising from strength, or a strong constitution or habit; the opposite of asthenic. Dr. Brown, in the first edition of his *Elementa Medicinæ*, made use of the word phlogistic to express this idea; because this class of diseases includes many of the inflammatory kind; but, as it does not include them all, many diseases apparently inflammatory being in fact asthenic, or diseases of debility, he adopted the terms sthenic and asthenic, and totally laid aside the terms phlogistic and antiphlogistic.

STHENIC DIATHESIS, that state of the body which produces sthenic diseases. 'The cause of sthenic diathesis,' says Dr. Brown, 'is too great an excitement of the whole living system by the stimulant powers. All the functions are first increased; a disturbance or irregularity then takes place in some; others are impaired; but not as long as this diathesis lasts by a debilitating operation.' See **BRUNONIAN SYSTEM**.

STHENIC DISEASES, general diseases arising from excessive excitement, the opposite of asthenic diseases, or diseases of debility. Dr. Brown calculates the proportion of sthenic diseases to asthenic in our country and climate, where there is little to stimulate the majority of the people

very highly, to be as three in 100. But with all the poverty, poor diet, and debilitating powers of the climate in Scotland, it is thought he might have safely made the proportion ten in 100. See **BRUNONIAN SYSTEM**.

STIENO, one of the three Gorgons.

STHENOBOEA, in fabulous history, the daughter of Jobates, king of Lycia, wife of Proetus, king of Argos, and step-mother to Belerophon, with whom she fell in love. See **BELEROPHON**.

STIBADIUM, among the Romans, a low kind of table couch, or bed of a circular form, which succeeded to the triclinia, and was of different sizes, according to the number of guests they were designed for. They were called hexaclina, octaclina, or enneaclina, according as they held six, eight, or nine guests, and so of any other number.

STIBIAL, *adj.* } Lat. *stibium*. Antimo-
STIBIA'RIAN, *n. s.* } nial: a man violent from
the operation of antimony.

The former depend upon a corrupt incinerated melancholy, and the latter upon an adust stibial or eruginous sulphur. *Harvey.*

This stibiarian presseth audaciously upon the royal throne, and, after some sacrifice, teadereth a bitter pill of sacrilege and cruelty; but, when the same was rejected because it was violent, then he presents his antimonian potion. *White.*

STICHI, an ancient kind of verse.

STICHOS, a name given by the old writers to a pectoral confection, the principal ingredient of which was the herb marrubium, or horehound.

STICK, *v. n., v. a., & n. s.* } *Pret & part.*
STICKLE, *v. a.* } *pass.* stuck; *Sax.*
STICKLER, *n. s.* } *Fr.*ican. To ad-
STICKY, *adj.* } here; fasten upon;

be united with, or rest upon; stop; lose motion: hence to be constant; remain; scruple; hesitate: as a verb active, to fasten on, fasten by transfixion; stab; pain with any thing pointed: as a noun substantive, any long and slender instrument; a long and slender piece of wood: 'to stick out' is to be remarkably prominent: to stickle is (literally) to interpose with sticks, as the seconds of prize fighters formerly did: to interpose between combatants; contest; alternate; act between opposite parties: the noun substantive corresponding: sticky is viscid; adhesive.

His flesh is consumed away that it cannot be seen, and his bones that were not seen *stick out*.

Job xxxiii. 21.

I will cause the fish of thy rivers to *stick* unto thy scales. *Ezek.*

Basilus, the judge, appointed *sticklers* and trumpets, whom the others should obey. *Sidney.*

Now does he feel

His secret murders *sticking* on his hands.

Shakspeare. Macbeth.

Wherefore could I not pronounce amen?

I had most need of blessing, and amen

Stuck in my throat. *Id.*

If we should fail,

—We fail!

But screw your courage to the *sticking* place,

And we'll not fail. *Id.*

The knave will *stick* by thee, I can assure thee that: he will not out, he is true bred.

Shakspeare. Henry IV.

Though the sword be put into the sheath, we must not suffer it there to rust, or *stick* so fast as that we shall not be able to draw it readily when need requires.

Raleigh.

The green caterpillar breedeth in the inward parts of roses not blown, where the dew *sticketh*. Bacon.

The going away of that which had staid so long, doth yet *stick* with me. Id. Natural History.

Herbs which last longest are those of strong smell, and with a *sticky* stalk. Id.

The church of Rome, under pretext of exposition of scripture, doth not *stick* to add and alter. Bacon.

Let them go to't, and *stickle*,

Whether a conclave or conventicle. Cleaveland.

The first contains a *sticking* fast to Christ, when the Christian profession is persecuted; and the second a rising from sin, as he rose to a new Christian life. Hammond.

They never doubted the commons; but heard all *stuck* in the lords house, and desired the names of those who hindered the agreement between the lords and commons. Clarendon.

Fortune, as she's wont, turned fickle, And for the foe began to *stickle*. Hudibras.

Quercetanus, though the grand *stickler* for the tria prima, has this concession of the irresolubleness of diamonds. Boyle.

They could not but conclude that to be their interest, and, being so convinced, pursue it and *stick* to it. Tillotson.

None of those, who *stick* at this impediment, have any enemies so bitter and implacable as they found theirs. Kettlewell.

Some strike from clashing flints their fiery seed, Some gather *sticks* the kindled flames to feed. Dryden.

Two troops in fair array one moment showed; The next, a field with fallen bodies strowed: The points of spears are *stuck* within the shield, The steeds without their riders scour the field, The knight's unhorsed. Id.

Some *stick* to you, and some to t'other side. Id. I'll stand betwixt; it first shall pierce my heart, We will be *stuck* together on his dart.

Id. Tyrannick Love.

A lofty pile they rear; The fabrick's front with cypress twigs they strew, And *stick* the sides with boughs of baleful yew. Dryden.

When he sees half of the Christians killed, and the rest in a fair way of being routed, he *stickles* betwixt the remainder of God's host and the race of fiends. Id.

Our former chiefs, like *sticklers* of the war, First sought to inflame the parties, then to poise: The quarrel loved, but did the cause abhor; And did not strike to hurt, but make a noise. Id. Rather than impute our miscarriages to our own corruption, we do not *stick* to arraign providence itself. L'Estrange.

If the matter be knotty, the mind must stop and buckle to it, and *stick* upon it with labour and thought, and not leave it till it has mastered the difficulty. Locke.

That two bodies cannot be in the same place is a truth that nobody any more *sticks* at than at this maxim, that it is impossible for the same thing to be and not to be. Id.

Where they *stick*, they are not to be farther puzzled by putting them upon finding it out themselves. Id. I shudder at the name!

My blood runs backward, and my fault'ring tongue *Sticks* at the sound. Smith's Phœdra and Hippolitus.

The Heruli, when their old kindred fell sick, *stuck* them with a dagger. Grew.

We are your only friends; *stick* by us, and we will *stick* by you. Davenant.

Would our ladies, instead of *sticking* on a patch against their country, sacrifice their necklaces against the common enemy, what decrees ought not to be made in their favour! Addison.

The advantage will be on our side, if we *stick* to its essentials. Id. Freeholder.

The inferior tribe of common women have, in most reigns, been the professed *sticklers* for such as have acted against the true interests of the nation. Id.

To *stick* at nothing for the publick interest, is represented as the refined part of the Venetian wisdom. Id. on Italy.

Some *stick* not to say, that the parson and attorney forged a will. Arbuthnot.

He is often stigmatized with it, as a note of infamy, to *stick* by him whilst the world lasteth. Sanderson.

Oh for some pedant reign, Some gentle James to bless the land again; To *stick* the doctor's chair unto the throne, Give law to words, or war with words alone. Pope.

I am satisfied to trifle away my time, rather than let it *stick* by me. Id. Letters.

In their quarrels they proceed to calling names, till they light upon one that is sure to *stick*. Swift.

The tory or high church clergy were the *sticklers* against the exorbitant proceedings of king James II. Id.

All place themselves in the list of the national church, though they are great *sticklers* for liberty of conscience. Id.

Souls a little more capacious can take in the connexion of a few propositions; but if the chain be prolix, here they *stick* and are confounded. Watts on the Mind.

Proverbial sentences are formed into a verse whereby they *stick* upon the memory. Watts.

If on your fame our sex a blot has thrown, 'Twill ever *stick* thro' malice of your own. Young.

STICKS, or FOOT-STICKS, in printing, slips of wood that lie between the foot of the page and the chase, to which they are wedged fast by the quoins, to keep the form firm in conjunction with the side-sticks, which are placed at the side of the page, and fixed in the same manner by means of quoins.

STICKLEBACK, or STICKLEBAG, in ichthyology. See GASTEROSTEUS.

STIFELIUS, a German divine and mathematician, born at Eslingen, in 1509. He published a treatise on Algebra, in the German language, and another on the Calendar. He died at Jena in 1657, aged fifty-eight.

STIFF, *adj.* Sax. *stif*; Danish *stif*; Swed. *stif*. Rigid; inflexible; strong; resisting flexure; not flaccid; not pliant: hence hardy; stubborn; pertinacious, harsh; formal: to stiffen is to make stiff; grow stiff; become torpid or obstinate: the adverb and noun substantive follow the senses of stiff, adjective: and the compounds are of obvious meaning.

He *stiffened* his neck, and hardened his heart from turning unto the Lord. 2 Chron. xxxvi. 13. They are impudent children, and *stiff-hearted*. Ezek. ii.

I commended them that stood so *stiffly* for the Lord. 2 Esdras.

The poor, by them disrobed, naked lie,
Veiled with no other covering but the sky;
Exposed to *stiff'ning* frosts, and drenching showers,
Which thickened air from her black bosom pours.

Sandys.

An infinite charge to her majesty, to send over
such an army as should tread down all that standeth
before them on foot, and lay on the ground all the
stiffnecked.

Spenser.

There fill yourself with those most joyous sights,
But speak no word to her of these sad plights,
Which her too constant *stiffness* doth constrain. *Id.*

We neither allow unmeet nor purpose the *stiff* de-
fence of any unnecessary custom heretofore received.

Hooker.

In matters divine, it is still maintained *stiffly*, that
they have no *stiffnecked* force. *Id.*

How *stiff* is my vile sense,
That I stand up, and have ingenious feeling
Of my huge sorrows! Better I were distract!

Shakspeare.

Id.

This is *stiff* news.

When the blast of war blows in our ears,
Stiffen the sinews, summon up the blood,
Disguise fair nature with hard-favoured rage.

Henry V.

The Indian fig of itself multiplieth from root to
root; the plenty of the sap, and the softness of the
stalk, making the bough, being over-loaden and not
stiffly upheld, to weigh down. *Bacon.*

The *stiffness* and dryness of iron to melt, must be
helped by moistening or opening it. *Id.*

Yield to others when there is cause; but it is a
shame to stand *stiff* in a foolish argument. *Taylor.*

On a *stiff* gale

The Theban swan extends his wings. *Denham.*

This *stiffnecked* pride nor art nor force can bend,
Nor high-flown hope, to reason's lure descend. *Id.*

The pillars of this frame grow weak,
My sinews slacken, and an icy *stiffness*
Benumbs my blood. *Id.*

They, rising on *stiff* pinions, tower
The mid aerial sky. *Milton.*

A war ensues, the Cretans own their cause,
Stiff to defend their hospitable laws. *Dryden.*

Her eyes grow *stiffen'd*, and with sulphur burn. *Id.*
Her *stiff'ning* grief,

Who saw her children slaughtered all at once,
Was dull to mine. *Id. and Lee.*

The tender soil, then *stiff'ning* by degrees,
Shut from the bounded earth the bounding seas. *Dryden.*

Some souls we see

Grow hard, and *stiffen* with adversity. *Id.*
Still less and less my boiling spirits flow;
And I grow *stiff* as cooling metals do.

To try new shrouds, one mounts into the wind,
And one below their ease or *stiffness* notes. *Dryden.*

The willow bows and recovers, the oak is stubborn
and inflexible; and the punishment of that *stiffness*
is one branch of the allegory. *L'Estrange.*

Firmness or *stiffness* of the mind is not from adhe-
rence to truth, but submission to prejudice. *Locke.*

Mingling with that oily liquor, they were wholly
incorporate, and so grew more *stiff* and firm, making
but one substance. *Burnet's Theory.*

The vices of old age have the *stiffness* of it too;
and, as it is the unfittest time to learn in, so the un-
fitness of it to unlearn will be found much greater.

South's Sermons.

The French are open, familiar, and talkative; the
Italian *stiff*, ceremonious, and reserved.

Addison on Italy.

Fix'd in astonishment I gaze upon thee,
Like one just blasted by a stroke from heaven,
Who pants for breath, and *stiffens* yet alive;
In dreadful looks, a monument of wrath. *Id. Cato.*

All this religion sat easily upon him, without any
of that *stiffness* and constraint, any of those forbid-
ding appearances, which disparage the actions of the
sincerely pious. *Atterbury.*

Rules and critical observations improve a good ge-
nius, where nature leadeth the way, provided he is
not too scrupulous; for that will introduce a *stiffness*
and affectation which are utterly abhorrent from all
good writing. *Felton.*

The glittering robe
Hung floating loose, or *stiff* with mazy gold.

Thomson.

Stiff forms are bad, but let not worse intrude,
Nor conquer art and nature to be rude. *Young.*

STIFFLE, or great muscle, in the manege,
is the part of the hind leg of a horse which ad-
vances towards his belly. This is a most dan-
gerous part to receive a blow upon.

STIGLIANO, or STILIGIANO, a town of Na-
ples, in Basilicata, famous for its baths; twenty-
four miles S. S. E. of Acerenza.

STIGMA, in botany, the summit or top of the
style, accounted by the sexualists the female or-
gan of generation in plants, which receives the
fecundating dust of the tops of the stamina, and
transmits its vapor or effluvia through the style
into the heart of the seed bud, for the purpose of
impregnating the seeds.

STIGMATA (plural of stigma), in antiquity,
certain marks impressed on the left shoulders of
soldiers when listed.

STIGMATA were also a kind of notes or abbrevi-
ations, consisting only of points, disposed vari-
ous ways; as in triangles, squares, crosses, &c.

STIGMATA is also a term introduced by the
Franciscans to express the marks or prints of
our Saviour's wounds, said to have been miracu-
lously impressed by him on the body of their
seraphic father St. Francis.

STIGMATA, in entomology, the apertures in
different parts of the bodies of insects, commu-
nicating with the tracheæ or air-vessels, and serv-
ing for the office of respiration.

STIGMATIZING, among the ancients, was
inflicted upon slaves as a punishment, but more
frequently as a mark to know them by; in which
case it was done by applying a red-hot iron,
marked with certain letters, to their foreheads,
till a fair impression was made; and then pour-
ing ink into their furrows, that the inscription
might be the more conspicuous. Soldiers were
branded in the hand with the name or character
of their general. It was also customary to stig-
matize the worshippers and votaries of some of
the gods. The marks used on these occasions
were various; sometimes they contained the
name of the god, sometimes his particular ensign,
as the thunderbolt of Jupiter, the trident of Nep-
tune, the ivy of Bacchus, &c., or they marked
themselves with some mystical number, whereby
the god's name was described. To these three
ways of stigmatizing, St. John is supposed to re-
fer in Rev. chap. xiii. ver. 16, 17. Theodoret is
of opinion that the Jews were forbidden to
brand themselves with stigmata, because the ido-
laters, by that ceremony, used to consecrate

themselves to their false gods. Among some nations, stigmatizing was considered as a distinguishing mark of honor and nobility. In Thrace, as Herodotus tells us, it was practised by none but persons of credit, nor omitted by any but persons of the meanest rank. The ancient Britons are also said to have imprinted on the bodies of their infants the figures of animals, and other marks, with hot irons.

STIL, or **STIL DE GRAIN**, in the color trade, the name of a composition used for painting in oil or water, and is made of a decoction of the lycium or Avignon berry, in alum water, which is mixed with whiting into a paste, and formed into twisted sticks. It ought to be chosen of a fine gold yellow, very fine, tender, and friable, and free from dirt.

STILAGO, in botany, a genus of plants belonging to the class of gynandria, and order of triandria. There is one female: *cal.* monophyllous, and almost three-lobed: *cor.* none; and the berry is globular. There is only one species, viz. *S. bonius*.

STILBE, in botany, a genus of plants belonging to the class of polygamia, and order of diecia. The exterior calyx of the hermaphrodite flower is triphyllous; the interior is quinquedentate and cartilaginous. The corolla is funnel-shaped and quinquefid. There are four stamina; and there is one seed in the interior calyx calyptrate. The female flower is similar, has no interior calyx nor fruit. There are three species; 1. *S. cornua*, 2. *S. ericoides*, and 3. *S. pinastra*, which are all foreign plants.

STILBE, or **STILBEA**, in the mythology, the daughter of the river god Peneus, by Creusa, and sister of the famous Daphne. She was not so shy as her sister, but, according to Diodorus, had two sons by her sister's lover, Apollo; viz. Centaurus and Lapithus, the progenitors of the Centaurs and Lapithæ.—*Diod. iv.*

STILBITE (from *στειλαω*, to shine), in mineralogy, a precious stone discovered by Hauy. See **MINERALOGY**.

STILE, *n. s.* Sax. *stigele*, from *stigan*, to climb. A set of steps to pass from one enclosure to another.

There comes my master and another gentleman from Frogmore, over the *stile* this way. *Shakspeare.*

If they draw several ways, they may be ready to hang themselves upon every gate or *stile* they come at. *L'Estrange.*

The little strutting pile,
You see just by the church-yard *stile*. *Swift.*

STILE, *n. s.* } Rather style. Fr. *stile*. A
STILAR, *adj.* } pin to cast the shadow on a sun-
dial: belonging to the stile of a dial.

Erect the *stile* perpendicularly over the substilar line, so as to make an angle with the dial plane equal to the elevation of the pole of your plane.

Moxon's Mechanical Exercises.

At fifty-one and a half degrees, which is London's latitude, make a mark; and, laying a ruler to the centre of the plane and to this mark, draw a line from the *stilar* line. *Moxon.*

STILES (Ezra), D.D. and L.L.D., a late learned and pious divine of the United States, born at North Haven in Connecticut, November 19th, 1727, O. S. He studied at Yale College,

and graduated there in 1746; and in 1749 was appointed one of its tutors, which station he held six years. In 1755 he was settled minister of Newport, in Rhode Island, and remained there till 1776, when the disturbances occasioned by the war obliged him to remove to Portsmouth in New Hampshire. In 1777 he was elected president of Yale College; which he held till his death, and was also professor of Church History. He maintained a correspondence with learned men on both sides of the Atlantic; and was a member of several philosophical societies. He possessed in an eminent degree the faculty of communicating knowledge to his pupils. He published some tracts suitable to his profession; and died much respected as a citizen and a minister, on the 12th of May 1795, at Newhaven, Connecticut, of a bilious fever.

STILETTO, *n. s.* Ital. *stiletto*; Fr. *stilet*. A small pointed dagger.

When a senator should be torn in pieces, he hired one, who, entering into the senate-house, should assault him as an enemy to the state; and stabbing him with *stilettoes*, leave him to be torn by others.

Hakewill on Providence.

STILICHO, a brave general of the Romans, under Theodosius the Great and Honorius, who twice merited and obtained the title of Deliverer of Italy. Yet, after all his services, he fell under the suspicion of Honorius, who ordered him to be beheaded, and his family extirpated, A. D. 408. From the confused and partial records of these dark ages it is difficult to discover the truth; but contemporary writers vindicate Stilicho. Claudian is loud in his praises, and Zosimus denies the truth of the charges against him.—*Hist. v.* See **ROME**.

STILL, *v. a., adj., & n. s.* } Saxon *stilan*;
STILLBORN, *adj.* } Belg. *stillen*; Go-
STILLNESS, *n. s.* } thic *stilla* is to fix;
STILLY, *adv.* } To silence; make
silent; appease: quiet; calm; silent; motionless: hence in still-born, signifying dead in the birth: a calm; silence: stillness, corresponds with still, adjective and verb active: stilly is silently; calmly.

Gyrecia sit *still*, but with no *still* pensiveness. *Sidney.*

Atin when he spied
Thus in *still* waves of deep delight to wade,
Fiercely approaching to him loudly cried. *Spenser.*

Your wife Octavia, with her modest eyes,
And *still* conclusion, shall acquire no honour,
Demuring upon me.

Shakspeare. Antony and Cleopatra.

Herne the hunter,
Sometime a keeper here in Windsor forest,
Doth all the winter tyme, at *still* of midnight,
Walk round about an oak with ragged horns.

Shakspeare.

How sweet the moonlight sleeps upon this bank.
Here will we sit, and let the sounds of musick
Creep in our ears; soft *stillness* and the night
Become the touches of sweet harmony. *Id.*

Is this the scourge of France?
Is this the Talbot so much feared abroad,
That with his name the mothers *still* their babes?
Id.

The gravity and *stillness* of your youth
The world hath noted. *Id. Othello.*

From camp to camp, through the foul womb of night,
The hum of either army *stilly* sounds.

Id. Henry V.

Grant that our hopes, yet likely of fair birth,
Should be *stillborn*, and that we now possess
The utmost man of expectation, we are
A body strong enough to equal with the king.

Shakspeare.

He had never any jealousy with his father, which
might give occasion of altering court or council upon
the change ; but all things passed in a *still*.

Bacon's Henry VII.

In all refrainings of anger, it is the best remedy to
make a man's self believe that the opportunity of
revenge is not yet come ; but that he foresees a time
for it, and so to *still* himself in the mean time, and
reserve it.

Bacon.

From hence my lines and I depart ;
I to my soft *still* walks, they to my heart ;
I to the nurse, they to the child of art.

Donne.

Many casualties were but matter of sense ; as,
whether a child were abortive or *stillborn*.

Graunt's Bills of Mortality.

When black clouds draw down the lab'ring skies,
An horrid *stillness* first invades the ear,
And in that silence we the tempest fear.

Dryden.

The pale assistants on each other stared
With gaping mouths for issuing words prepared ;
The *stillborn* sounds upon the palate hung,
And died imperfect on the faltering tongue.

Id.

That, in this state of ignorance, we shortsighted
creatures might not mistake true felicity, we are en-
dowed with a power to suspend any particular desire.
This is standing *still* where we are not sufficiently
assured.

Locke.

Religious pleasure moves gently, and therefore
constantly. It does not affect by rapture, but is like
the pleasure of health, which is *still* and sober.

South.

The storm was laid, the winds retired
Obedient to thy will ;

The sea that roared at thy command,
At thy command was *still*.

Addison.

Hope quickens all the *still* parts of life, and keeps
the mind awake in her most remiss and indolent
hours.

Id.

Silius Italicus has represented it as a very gentle
and *still* river, in the beautiful description he has
given of it.

Id.

He, having a full sway over the water, had power
to *still* and compose it, as well as to move and dis-
turb it.

Woodward.

How all things listen while thy muse complains !
Such silence waits on Philomela's strains
In some *still* evening, when the whispering breeze
Pants on the leaves, and dies upon the trees.

Pope.

Thy stone, O Sisyphus, stands *still* ;

Id.

Ixon rests upon his wheel.
The third fair morn now blazed upon the main,
Then glassy smooth lay all the liquid plain,
The winds were hush'd, the billows scarcely curled,
And a dead silence *still'd* the wat'ry world.

Id.

If a house be on fire, those at next door may es-
cape, by the *stillness* of the weather.

Swift.

I know a trick to make you thrive ;

O, 'tis a quaint device !

Your *stillborn* poems shall revive,

And scorn to wrap up spice.

Id.

STILL, adv. Sax. *ruille*. To this time ; till
now ; always ; ever ; in continuance ; neverthe-
less ; after that.

Unless God from heaven did by vision *still* shew
them what to do, they might do nothing.

Hooker.

In the primitive church, such as by fear being
compelled to sacrifice to strange gods, after repented
and kept *still* the office of preaching the gospel.

Whitgift.

My brain I'll prove the female to my soul,
My soul the father ; and these two beget
A generation of *still*-breeding thoughts.

Shakspeare

I with my hand at midnight held your head ;
And, like the watchful minutes to the hour,
Still and anon cheared up the heavy time,
Saying, What want you ?

Id. King John.

It hath been anciently reported, and is *still* re-
ceived, that extreme applauses of great multitudes
have so rarified the air, that birds flying over have
fallen down.

Bacon.

He told them, that if their king were *still* absent
from them, they would at length crown apes.

Davies on Ireland.

Whom the disease of talking *still* once possesseth,
he can never hold his peace.

Ben Jonson.

Chymists would be rich, if they could *still* do in
great quantities what they have sometimes done in
little.

Boyle.

Trade begets trade, and people go much where
many people are already gone : so men *run still* to a
crowd in the streets, though only to see.

Temple.

Thou, O matron !

Here dying, to the shore hast left thy name ;
Cajeta *still* the place is called from thee,
The nurse of great Ænæas' infancy.

Dryden's Æneid.

As God sometimes addresses himself in this man-
ner to the arts of men ; so, if the heart will receive
such motions by a ready compliance, they will re-
turn more frequently, and *still* more and more power-
fully.

South.

The desire of fame betrays the ambitious man into
indecencies that lessen his reputation ; he is *still*
afraid lest any of his actions should be thrown away
in private.

Addison.

The moral perfections of the Deity, the more atten-
tively we consider, the more perfectly *still* we know
them.

Atterbury.

The fewer *still* you name, you wound the more ;
Bond is but one, but Hurpax is a score.

Pope.

STILL, n. s. & v. n. } From distil, and
STILLATORY, n. s. } Lat. *stillo*. A vessel
STILLICIDE, } for distillation ; an a-
STILLICIDIOUS, adj. } lembic : to drop ; fall
in drops : a stillatory is either the still or room
where it is used : stillicide, a succession of drops :
stillicidious, falling in drops : all these words are
out of use.

In all *stillatories*, the vapour is turned back upon
itself, by the encounter of the sides of the *stillatory*.

Bacon.

The *stillicides* of water, if there be water enough
to follow, will draw themselves into a small thread,
because they will not discontinue.

Id. Natural History.

His sceptre against the ground he threw,
And tears *stilled* from him which moved all the crew.

Chapman.

All the offices that require heat, as kitchens, *stillato-*
ries, stoves, should be meridional.

Wotton's Architecture.

Short thick sobs, whose thundering volleys float,
And roul themselves over her lubric throat
In panting murmurs, *stilled* out of her breast,
That ever bubbling spring.

Cushane.

Nature's confectioner, the bee,
Whose suckets are moist alchimy

The *still* of his refining mold
Minting the garden into gold.

Cleaveland.

Crystal is sometimes found in rocks, and in some places not unlike the sturious or *stillicidious* dependencies of ice.

Brown.

These are nature's *stillatories*, in whose caverns the ascending vapours are congealed to that universal *aquavitæ*, that good fresh water.

More against Atheism.

In distilling hot spirits, if the head of the *still* be taken off, the vapour which ascends out of the *still* will take fire at the flame of a candle, and the flame will run along the vapour from the candle to the *still*.

Newton's Opticks.

This fragrant spirit is obtained from all plants in the least aromatick, by a cold *still*, with a heat not exceeding that of summer.

Arbutnot on Aliments.

STILL-BOTTOM, in the distillery, a name given by the traders to what remains in the still after working the wash into low wines. These bottoms are procured in the greatest quantity from the malt-wash, and are of so much value to the distiller in the fattening of hogs, &c., that he often finds them one of the most valuable articles of the business. See DISTILLATION.

STILLINGFLEET (Edward), bishop of Worcester, was the son of Samuel Stillingfleet, gent. and was born at Cranborn in Dorsetshire in 1635. He was educated at St. John's College, Cambridge; and, having received orders, was, in 1657, presented to the rectory of Sutton in Nottinghamshire. By publishing his *Origines Sacræ*, one of the ablest defences of revealed religion that has ever been written, he soon acquired such reputation that he was appointed preacher of the Rolls Chapel; and in January 1665 was presented to the rectory of St. Andrew's, Holborn. He was afterwards chosen lecturer at the Temple, and appointed chaplain in ordinary to king Charles II. In 1668 he took the degree of D. D., and was soon after engaged in a dispute with those of the Romish religion, by publishing his *Discourse concerning the Idolatry and Fanaticism of the Church of Rome*, which he afterwards defended against several antagonists. In 1680 he preached at Guildhall chapel a sermon on Phil. iii. 26, which he published under the title of *The Mischief of Separation*; and, this being immediately attacked by several writers, he in 1683 published his *Unreasonableness of Separation*. In 1685 appeared his *Origines Britannicæ*, or the *Antiquities of the British Church*, in folio. During the reign of king James II. he wrote several tracts against popery, and was prolocutor of the convocation, as he had likewise been under Charles II. After the Revolution he was advanced to the bishopric of Worcester, and was engaged in a dispute with the Socinians, and also with Mr. Locke; in which last contest he is generally thought to have been unsuccessful. He died at Westminster in 1699, and was interred in the cathedral of Worcester, where a monument was erected to his memory by his son. Dr. Stillingfleet wrote several other works, which, with the above, have been reprinted in 6 vols. folio.

STILLINGFLEET (Edward), son of the bishop, was fellow of St. John's College in Cambridge, F. R. S., M. D., and Gresham professor of physics;

but marrying in 1692 he lost his lucrative offices and his father's favor; a misfortune that affected both himself and his posterity. However, going into orders, he obtained, by his father's means, the living of Newington Butts, which he immediately exchanged for those of Wood-Norton, and Swanton in Norfolk. He died in 1708.

STILLINGFLEET (Benjamin), only son of the preceding, was educated at Norwich school, which he left in 1720, with the character of an excellent scholar. He then went to Trinity College in Cambridge, at the request of Dr. Bentley, the master, who had been private tutor to his father, domestic chaplain to his grandfather, and much indebted to the family. Here he was a candidate for a fellowship, but was rejected by the master's influence. This was a severe and unexpected disappointment, and but little alleviated by the doctor's apology, that it was a pity that a gentleman of Mr. Stillingfleet's parts should be buried within the walls of a college. See BENTLEY. This ingratitude of Dr. Bentley was however not of any real disservice to Mr. Stillingfleet. By being thrown upon the world, he formed many honorable and valuable connections. He dedicated some translations of Linnæus to the late lord Lyttleton, partly, he says, from motives of private respect and honor. Lord Barrington gave him the place of the master of the barracks at Kensington; a favor to which Mr. Stillingfleet, in the dedication of his *Calendar of Flora* to that nobleman, alludes with politeness and gratitude. His *Calendar of Flora* was found at Stratton in Norfolk in 1755, at the hospitable seat of his worthy and ingenious friend Mr. Marsham, who had made several observations of that kind, and had communicated to the public his curious observations on the growth of trees. But it was to Mr. Wyndham of Felbrig in Norfolk that he appears to have had the greatest obligations; he travelled abroad with him, spent much of his time at his house, and was appointed one of his executors (Mr. Garrick was another), with a considerable addition to an annuity which that gentleman had settled upon him in his lifetime. Mr. Stillingfleet's genius seems to have led him principally to the study of natural history: which he prosecuted as an ingenious philosopher, a useful citizen, and a good man. In this walk of learning he mentions, as his friends, Dr. Watson, Dr. Solander, Mr. Hudson, Mr. Price of Foxley, Mr. Pennant, and some others. Mr. Stillingfleet published a volume of miscellaneous tracts, which is in much esteem, and does great honor to his head and heart. They are chiefly translations of some essays in the *Amœnitates Academicæ*, published by Linnæus, interposed with some observations and additions of his own. But his *Essay on Conversation*, published in the first volume of Dodsley's Collection of Poems, entitles him to a distinguished rank among our English poets. Here more than once Mr. Stillingfleet shows himself still sore for Dr. Bentley's cruel treatment of him; and, towards the beautiful and moral close of it, seems to hint at a mortification of a more delicate nature, which he had suffered from the other sex. To these disappointments it was perhaps owing that Mr. Stillingfleet neither married nor went

into orders. His London residence was at a Saddler's in Piccadilly; where he died in 1771, aged above seventy, leaving several valuable papers behind him.

STILLINGIA, in botany, a genus of plants belonging to the class of monœcia, and to the order of monodelphia: MALE CAL. hemispherical and multiflorous: COR. tubulous, and arose or gnawed; FEMALE CAL. uniflorous and inferior: COR. superior. The style is trifid, and the CAPS. three-grained. There is one species; *S. sylvatica*. **STILOBATUM** in architecture, denotes the body of the pedestal of any column.

STILPO, a celebrated philosopher of Megara, who flourished in the reign of Ptolemy Euergetes. In his youth he had been addicted to licentious pleasures, from which he religiously refrained from the moment that he ranked himself among philosophers. When Ptolemy Soter, at the taking of Megara, offered him a large sum of money, and requested that he would accompany him into Egypt, he accepted but a small part of the offer, and retired to the island of Ægina, whence, on Ptolemy's departure, he returned to Megara. That city being again taken by Demetrius the son of Antigonus, and the philosopher required to give an account of any effects which he had lost during the hurry of the plunder, he replied that he had lost nothing; for no one could take from him his learning and eloquence. So great was the fame of Stilpo that the most eminent philosophers of Athens took pleasure in attending upon his discourses. His peculiar doctrines were, that species or universals have no real existence, and that one thing cannot be predicated of another. With respect to the former of these opinions, he seemed to have taught the same doctrine with the sect afterwards known by the appellation of nominalists. To prove that one thing cannot be predicated of another, he said, that goodness and man, for instance, are different things, which cannot be confounded by asserting the one to be the other; he argued farther, that goodness is a universal, and universals have no real existence: consequently, since nothing cannot be predicated of any thing, goodness cannot be predicated of man. Thus, whilst this subtle logician was, through his whole argument, predicating one thing of another, he denied that any one thing could be the accident or predicate of another. If Stilpo was serious in this reasoning; if he meant any thing more than to expose the sophistry of the schools, he must be confessed to have been an eminent master of the art of wrangling; and it was not wholly without reason that Glycera, a celebrated courtesan, when she was reproved by him as a corrupter of youth, replied that the charge might be justly retorted upon himself, who spent his time in filling their heads with sophistical quibbles and useless subtilties. In ethics he seems to have been a Stoic, and in religion he had a public and a private doctrine, the former for the multitude, and the latter for his friends. He admitted the existence of a supreme divinity, but had too much sense to reverence the Grecian superstitions.

STILTS, *n. s.* Sax *stælcan*; Swed. *stylter*. Supports on which boys raise themselves when they walk.

Some could not be content to walk upon the battlements, but they must put themselves upon stilts.

Howell's England's Tears.
The heron, and such like fowl that live of fishes, walk on long stilts like the people in the marshes.

More against Atheism.
Men must not walk upon stilts. *L'Estrange.*

STIMULATE, *v. a.* } Latin *stimulo*. To
STIMULATION, *n. s.* } prick; to prick forward; excite; urge by a pungent motive: in physic, to excite a quick sensation, with a derivation towards the part: the noun substantive corresponding.

Extreme cold *stimulates*, producing first a rigour, and then a glowing heat; those things which *stimulate* in the extreme degree excite pain.

Arbuthnot on Diet.
Some medicines lubricate, and others both lubricate and stimulate. *Sharp.*

Some persons, from the secret *stimulations* of vanity or envy, despise a valuable book, and throw contempt upon it by wholesale. *Watts on the Mind.*

STIMULI (Lat.) stimulus; in botany, a species of armature or offensive weapon, with which some plants, as nettle, cassida, acalypha, and tragia are furnished. Their use, says Linnæus, is by their venomous punctures to keep off naked animals that would approach to hurt them.

STIMULI, stimulants, or exciting powers, in the new system of medicine, comprehend every thing that can affect the human body, or mind, inwardly or outwardly. These Dr. Brown divides into internal and external; and the latter he subdivides into durable and diffusible. See **BRUNONIAN SYSTEM**.

STING, *v. a. & n.* } *Pret.* I stung or stang;
STINGLESS, *adj.* } *part. pass.* stang or stung. Sax. *stingian*; Isl. *stungen*, sore pricked. To pierce or wound with a darted point, as that of wasps or scorpions; to pain acutely: any thing that gives a sharp pain or morbid sensation; the point of an epigram.

The snake, rolled in a flow'ry bank,
With shining checkered slough, doth *sting* a child
That for the beauty thinks it excellent. *Shakspeare.*

His unkindness,
That stript her from his benediction, turned her
To foreign casualties, gave her dear right;
To his doghearted daughters; these things *sting* him
So venomously that burning shame detains him
From his Cordelia. *Id.*

Serpents have venomous teeth, which are mistaken for their *sting*. *Bacon's Natural History.*

His rapier was a hornet's *sting*,
It was a very dangerous thing;
For if he chanced to hurt the king,
It would be long in healing. *Drayton.*

He hugs this viper when he thinks it *stingless*
Decay of Piety.
That snakes and vipers *sting*, and transmit their mischief by the tail, is not easily to be justified; the poison lying about the teeth, and communicated by the bite. *Browne.*

It is not the jerk or *sting* of an epigram, nor the seeming contradiction of a poor antithesis. *Dryden.*

No more I wave
To prove the hero—slander *stings* the brave. *Pope.*
The *stinging* lash apply. *Id.*
The Jews receiving this book originally with such *sting* in it, shows that the authority was high. *Forbes.*

The *STING* is an apparatus in the bodies of certain insects, in form of a little spear, serving them as a weapon of offence. See *BEE*.

STING-RAY, in ichthyology. See *RATA*.

STING'GY, *adj.* Ital. *stenau*. A low cant word. Covetous; niggardly; avaricious.

A *stingy* narrow-hearted fellow, that had a deal of choice fruit, had not the heart to touch it till it began to be rotten. *L'Estrange*.

He relates it only by parcels, and won't give us the whole; which forces me to bespeak his friends to engage him to lay aside that *stingy* humour, and gratify the publick at once.

Arbutnot's History of John Bull.

STINK, *v. n. & n. s.*

STINK'ER, *n. s.*

STINK'INGLY, *adv.*

STINK'POT, *n. s.*

Præf. I stunk or

stank. Sax. *Γετνιαν*

Belgic and Teutonic

stincken; Swed. *stinka*.

To emit an offensive smell, commonly a smell of putrefaction: a smell of this kind: a stinker is something intended to emit such a smell: the adverb corresponds with the verb neuter: and stinkpot is a name given to a composition peculiarly offensive to the smell.

When the children of Ammon saw that they stunk before David, they sent and hired Syrians.

2 Sam. x. 6.

John, it will be *stinking* law for his breath.

Shakspeare.

Those *stinks* which the nostrils straight abhor are not most pernicious; but such airs as have some similitude with man's body, and so betray the spirits.

Bacon's Natural History.

The air may be purified by burning of *stinkpots* or *stinkers* in contagious lanes.

Harvey.

They share a sin, and such proportions fall, That, like a *stink*, 'tis nothing to them all.

Dryden.

What a fool art thou to leave thy mother for a nasty *stinking* goat!

L'Est-ange.

Most of smells want names; sweet and *stinking* serve our turn for these ideas, which is little more than to call them pleasing and displeasing.

Loche.

Chloris, this costly way to *stink* give o'er,

'Tis throwing sweet into a common shore;

Not all Arabia would sufficient be;

'Thou smell'st not of thy sweets, they *stink* of thee.

Granville.

By what criterion do ye eat, d' ye think,

If this is prized for sweetness, that for *stink*.

Pope.

The *STINK-POT* is an earthen jar or shell charged with powder, grenadoes, and other materials of an offensive and suffocating smell. It is frequently used by privateers, in the western ocean, in the attack of an enemy whom he designs to board; for which purpose it is furnished with a light fuse at the opening or touch-hole. See *BOARDING*.

STINT, *v. a. & n. s.* Swed. and Goth. *stynta*; Isl. *stunta*. To bound; limit; restrain; stop: a limit; bound; restraint: hence a portion or assigned quantity.

Then hopeless, heartless, 'gan the cunning thief, Persuade us die, to *stint* all further strife.

Spenser.

The reason hereof is the end which he hath proposed, and the law whereby his wisdom hath *stinted* the effects of his power in such sort that it doth not work infinitely, but correspondently, unto that end for which it worketh.

Hooker.

Touching the *stint* or measure thereof, rites and ceremonies, and other external things of the like na-

ture, being hurtful unto the church, either in respect of their quality, or in regard of their number; in the former there could be no doubt or difficulty what would be done; their deliberation in the latter was more difficult. *Id.*

Our *stint* of woe

Is common; every day a sailor's wife

The masters of some merchant, and the merchant,

Have just our theme of woe. *Shakspeare.*

He that gave the hint,

This letter for to print,

Must also pay the *stint*.

Denham.

Nature wisely *stints* our appetite,

And craves no more than undisturbed delight.

Dryden.

The exteriors of mourning, a decent funeral, and black habits, are the usual *stints* of common husbands. *Id.*

A supposed heathen deity might be so poor in his attributes, so *stinted* in his knowledge, that a Pagan might hope to conceal his perjury from his notice.

Addison.

I shall not go about to extenuate the latitude of the curse upon the earth, or *stint* it only to the production of weeds; but give it its full scope, in an universal diminution of the fruitfulness of the earth.

Woodward.

How much wine drink you in a day? my *stint* in company is a pint at noon.

Swift.

Few countries which, if well cultivated, would not support double their inhabitants; and yet fewer where one-third are not extremely *stinted* in necessities. *Id.*

She *stints* them in their meals, and is very scrupulous of what they eat and drink, and tells them how many fine shapes she has seen spoiled in her time for want of such care. *Law.*

STIPA, feather-grass, in botany, a genus of plants belonging to the class of triandria and order of digynia; and in the natural system ranging under the fourth order, gramina. The calyx is bivalved. The exterior valve of the corolla is terminated by an awn; the base is jointed. There are nine species; viz. 1. *S. arguens*; 2. *aristella*; 3. *avenacea*; 4. *capillata*; 5. *juncea*; 6. *membranacea*; 7. *pennata*; 8. *spicata*; and, 9. *tenacissima*. Of these only one is British; viz. *S. pennata*, the common feather-grass. The beards are feathered. The plant rises to ten inches, grows on mountains, and flowers in July or August.

STIP'END, *n. s.*

Lat. *stipendium*.

STIPEND'IARY, *adj. & n. s.* } Wages; settled pay: stipendiary is receiving salaries or a stated price: he who receives such price.

His great *stipendiary* prelates came with troops of evil appointed horsemen not half full.

Knolles's History.

All the earth

Her kings and tetrarchs, are their tributaries;

People and nations pay them hourly *stipends*.

Ben Jonson.

This whole country is called the kingdom of Tunis; the king whereof is a kind of *stipendiary* unto the Turk.

Abbot.

St. Paul's zeal was expressed in preaching without any offerings or *stipend*.

Taylor.

If thou art become

A tyrant's vile *stipendiary*, with grief

That valour thus triumphant I behold

Which, after all its danger and brave toil

Deserves no honour from the gods of men. *Glover.*

Place rectors in the remaining churches, which are now served only by *stipendiary* curates. *Swift*.

STIPEND, among the ancient Romans, signified the same with tribute: and hence *stipendiarii* were the same with *tributarii*.

STIPULA, in botany, one of the fulcra or procs of plants, defined by Linnæus to be a scale, or small leaf, stationed on each side the base of the footstalks of the flower and leaves, at their first appearance, for the purpose of support. Elmgren restricts it to the footstalks of the leaves only.

STIPULATE, *v. n.* } Fr. *stipuler*; Lat. *sti-*
STIPULATION, *n. s.* } *pulor*. To contract; bargain; settle terms: the noun substantive corresponding.

We promise obediently to keep all God's commandments; the hopes given by the gospel depend on our performance of that *stipulation*. *Rogers*.

The Romans very much neglected their maritime affairs; for they *stipulated* with the Carthaginians to furnish them with ships for transport and war.

STIPULATION, in the civil law, the act of stipulating, that is, of treating and concluding terms and conditions to be inserted in a contract. Stipulations were anciently performed at Rome with abundance of ceremonies; the first whereof was, that one party should interrogate and the other answer to give his consent and oblige himself. By the ancient Roman law nobody could stipulate for himself; but as the *tabelliones* were public servants they were allowed to stipulate for their masters; and the notaries succeeding the *tabelliones* have inherited the same privilege.

STIR, *v. a., v. n., & n. s.* Sax. *stiran*; Belg. *stoeren*; Teut. *stoeren*. To move; remove from its place: hence to raise; excite; agitate; taking up (intens.): as a verb neuter, to move one's self; change place; be in motion: a commotion; public disturbance; agitation of the thoughts or passions.

Hell is moved for thee, to meet thee at thy coming; it *stirreth up* the dead for thee. *Isaiah* xiv. 9.

The words of Judas were very good, and able to *stir them up* to valour. *2 Maccabees* xiv. 17.

The greedy thirst of royal crown,
That knows no kindred, no regards, no right,
Stirred Porrex up to put his brother down. *Spenser*.

No power he had to *stir*, nor will to rise. *Id.*
Whosoever the earl shall die, all those lands are to come unto her majesty; he is like to make a foul *stir* there, though of himself of no power, yet through supportance of some others who lie in the wind.

Spenser's *Ireland*.
Having overcome and thrust him out of his kingdom, he *stirred up* the Christians and Numidians against him. *Knolles*.

With him is come the mother queen:
An Até *stirring* him to blood and strife. *Shakspeare*.

If you *stir* these daughters' hearts
Against their father, fool me not so much
To bear it tamely. *Id. King Lear*.

Come on; give me your hand, Sir; an early *stirrer*. *Shakspeare*.

If the gentlewoman that attends the general's wife be *stirring*, tell her there's one Cassio entreats of her a little favour of speech. *Id. Othello*.

What hallooing and what *stir* is this to-day?
These are my mates, that make their wills their law,
Have some unhappy passenger in chace. *Shakspeare*.

He did keep
The deck, with glove, or hat, or handkerchief,
Still waving, as the *stirs* and fits of 's mind
Could best express how slow his soul sailed on,
How swift his ship. *Id. Cymbelene*.

A perpetual spring, not found elsewhere but in the Indies only, by reason of the sun's neighbourhood, the life and *stirrer up* of nature in a perpetual activity. *Raleigh*.

Preserve the right of thy place, but *stir* not questions of jurisdiction; and rather assume thy right in silence, than voice it with claims. *Bacon*.

Being advertised of some *stirs* raised by his unnatural sons in England, he departed out of Ireland without a blow. *Davies*.

Tumultuous *stirs* upon this strife ensue. *Drayton*.
Nestor next beheld

The subtle Pylian orator range up and down the field,
Emballating his men at armes, and *stirring* all to blows. *Chapman*.

He did make these *stirs*, grieving that the name of Christ was at all brought into those parts. *Abbot*.

He hath spun a fair thread, to make all this *stir* for such a necessity as no man ever denied. *Bishop Bramhall*.

Tell, said the soldier, miserable Sir,
Why all these words, this clamour, and this *stir*?
Why do disputes in wrangling spend the day? *Denham*.

The vigorous spirit of Montrose *stirred him up* to make some attempt, whether he had any help or no. *Clarendon*.

They had the semblance of great bodies behind on the other side of the hill; the falsehood of which would have been manifest as soon as they should move from the place where they were, and from whence they were not to *stir*. *Id.*

Such mirth the jocund flute or gamesome pipe
Stirs up among the loose unlettered hinds. *Milton*.

Raphael, thou hearest what *stir* on earth
Satan, from hell 'scaped through the darksome gulf,
Hath raised in Paradise, and how disturbed
This night the human pair. *Id.*

One judgment in parliament, that cases of that nature ought to be determined according to the common law. is of greater weight than many cases to the contrary, wherein the question was not *stirred*; yea, even though it should be *stirred*, and the contrary affirmed. *Hale*.

The great *stirs* of the disputing world are but the conflicts of the humours. *Glanville*.

The improving of his own parts and happiness *stirs him up* to so notable a design. *More against Atheism*.

After all this *stir* about them, they are good for nothing. *Tillotson*.

My foot I had never yet in five days been able to *stir*, but as it was lifted. *Temple*.

The soldiers love her brother's memory,
And for her sake some mutiny will *stir*. *Dryden*.

To *stir up* vigour in him, employ him in some constant bodily labour. *Locke*.

Consider, after so much *stir* about genus and species, how few words we have yet settled definitions of. *Id.*

Silence is usually worse than the fiercest and loudest accusations; since it proceeds from a kind of numbness or stupidity of conscience, and an absolute dominion obtained by sin over the soul, so that it shall not so much as dare to complain or make a *stir*. *South's Sermons*.

Thou with rebel insolence didst dare,
To own and to protect that hoary ruffian,
To *stir* the factious rabble up to arms. *Rowe*.

The great Judge of all knows every different degree of human improvement, from these weak *stirrings* and tendencies of the will, which have not yet formed themselves into regular purposes, to the last entire consummation of a good habit.

Addison's Spectator.

The use of the passions is to *stir up* the mind and put it upon action, to awake the understanding, and to enforce the will.

Addison.

Other spirits

Shoot through their tracts, and distant muscles fill: This sovereign, by his arbitrary nod, Restrains or sends his minister abroad; Swift and obedient to his high command, They *stir* a finger, or they lift a hand. *Blackmore.*

Will it not reflect on thy character, Nic, to turn barterer in thy old days; a *stirrer up* of quarrels betwixt thy neighbours?

Arbutnot.

If they happen to have any superior character, they fancy they have a right to talk freely upon every thing that *stirs* or appears.

Watts.

We acknowledge a man to be mad or melancholy, who fancies himself to be glass, and so is afraid of *stirring*; or, taking himself to be wax, dares not let the sun shine upon him.

Law.

STIRIOUS, *adj.* Lat. *stiria*. Resembling icicles.

Chrystal is found sometimes in rocks, and in some places not much unlike the *stirious* or stillidicious dependencies of ice.

Browne's Vulgar Errors.

STIRLING, an ancient city of Scotland, situated on the river Forth, called also Sterling and Striveling; from the former of which Boethius and others derive the name Sterling money, because Osbeit, a Saxon prince, after the overthrow of the Scots, established a mint there. The name of Striveling is said to have been derived from the frequency of strifes or conflicts in the neighbourhood. The great street is very broad. The other streets are narrow and irregular. Stirling is in miniature a resemblance of Edinburgh, being built on a rock of the same form, with a fortress on the summit. The origin of the castle is unknown. The rock of Stirling was strongly fortified by the Picts, amongst whom architecture and other useful arts had made a considerable progress. As it lay in the extremities of their kingdom the possession of it was the occasion of frequent contests betwixt them and the Scots and Northumbrians; each of whose dominions did for some time terminate near it. When the Scots, under Kenneth II., overthrew the Pictish empire in the ninth century (as related under SCOTLAND) they endeavoured to obliterate every memorial of that people. They not only gave new names to provinces and towns, but, with all the rage of barbarians, demolished many magnificent edifices which had been reared up by them, and this fortress among the rest. The death of Kenneth II., the succession of Donald V., and the invasion of Scotland by the Saxons, under Osbrecht and Ella, two Northumbrian princes, with the Cumbrian Britons, and the Picts, are recorded under SCOTLAND, with Donald's first success against them, and his fatal defeat afterwards, which ended in the total cession of all their dominions upon the south side of the Forth to the conquerors. The rebuilding of the castle of Stirling by the Northumbrians, their planting it with a strong garrison, their

erection of the stone bridge over the Forth, with the cross of separation, the Latin distich, and other circumstances so humiliating to the Scots, are also there recorded. Yet none of the ancient English historians mention this conquest. But its authenticity is confirmed by the arms of the town of Stirling, upon which is a bridge with a cross, and the last line of the Latin distich is the motto round it. In those times, however, that fortress bore no resemblance to the present structure. Its size and form resembled those castles which, under the feudal constitution, the English and Scottish barons used to erect upon their estates for dwelling-houses; and which, in those barbarous ages, they fortified for their defence, both against foreign invaders and their own neighbours. It is directly such a Gothic figure as this which represents the Castrum Strivelense upon the arms of Stirling. This fortress, after it had continued in the possession of the Northumbrian Saxons about twenty years, was, together with the whole country upon the south side of the Forth, restored to the Scots upon condition of their assisting the Saxons against their turbulent invaders the Danes. Upon the arms of Stirling are two branches of a tree, to represent the Nemus Strivelense (the wood of Stirling), but the situation and boundaries of that forest cannot be ascertained. Upon the south of Stirling vestiges of a forest are still discernible for several miles. Banks of natural timber still remain in the castle park, at Murray's Wood, and near Nether Bannockburn; and stumps of trees, with much brushwood, are to be seen in all the adjacent fields. When Kenneth III. received intelligence of the Danes having invaded his dominions, he appointed the castle of Stirling to be the place of rendezvous for his army; and he marched thence to the battle of Loncarty, where, by the help of the brave Thomas Hay and his sons, he obtained a victory over those rovers in 970. See SCOTLAND. In the twelfth century this castle is spoken of as a place of great importance, and one of the strongest fortresses in the kingdom. In 1174 king William was taken prisoner in an unsuccessful expedition which he made into England; and, after having been detained twelve months in captivity, was released upon stipulating to pay a large sum of money for his ransom; and, until payment thereof, delivering into the hands of the English the four principal fortresses in the kingdom; viz. Stirling, Edinburgh, Roxburgh, and Berwick. This was the first great ascendant that England obtained over Scotland; and indeed the most important transaction which had passed between these kingdoms from the Norman conquest. Though the Scottish monarchs, in their perambulations through the kingdom, often visited Stirling, and held their courts in the castle, yet it did not become a royal residence till the family of Stewart mounted the throne. It was the birth-place of James II.; and he frequently kept his court in it. It was the place where that prince performed an heroic deed, by stabbing William earl of Douglas with his own hand. Some historians call this an atrocious murder, but we differ from them. The earl had deserved death fifty times by his murders, oppressions, and other atrocities, and was at that

very time engaged in a formidable conspiracy against the king. James, therefore, after making him every offer of pardon, conciliation, and even promotion, all which he obstinately refused, only did an act of justice and necessity, in the lawless state of government that then prevailed, by cutting off a villain who was above the law. The royal apartments were at that time in the north-west corner of the castle. The room where the earl met his well merited death still goes by the name of Douglas's room.

James III., contracting a fondness for the castle on account of its pleasant situation, made it the chief place of his residence, and added several embellishments to it. He built within it a magnificent hall, a noble structure, still entire. It is now called the parliament house, having been designed for the accommodation of that supreme court. It was covered with an oaken roof of exquisite workmanship, which, though very little decayed, was a few years ago removed to make way for one of more modern structure. James also erected a college of secular priests in the castle, which he called the chapel royal, and which proved one cause of his own ruin. As the expenses necessary for maintaining the numerous officers of such an institution were considerable, he annexed to it the revenue of the rich priory of Coldingham, in the Merse, then vacant. This priory had long been holden by persons connected with the family of Hume; and that family, considering it as belonging to them, strongly opposed the annexation. The dispute lasted several years; one parliament passed a vote annexing the priory to the chapel royal; and a subsequent one prohibited every attempt contrary to that annexation. James V. was crowned in the castle of Stirling, and the palace, which is the chief ornament of it, was the work of that prince. This is a stately and commodious structure, all of hewn stone, with much statuary work, built in form of a square, with a small court in the middle, in which the king's lions were kept; and hence it is still called the lions' den. The palace contains many large and elegant apartments: the ground story is now converted into barrack-rooms for the garrison; the upper affords a house for the governor, with lodgings for the subaltern officers. Opposite to the palace, upon the north, stands an elegant chapel, built by James VI. for the baptism of his son prince Henry in 1594. In this chapel is preserved the hulk of a large boat, which that whimsical monarch caused to be built and placed upon carriages, to convey into the castle the provisions for that solemnity. A strong battery, with a tier of guns pointing to the bridge over the Forth, was erected during the regency of Mary of Lorraine, mother to queen Mary. It is called the French battery, because constructed by engineers of that nation. The last addition was made to the fortifications in the reign of queen Anne. Formerly they reached no farther than the old gate, upon which the flag-staff now stands; but in that reign they were considerably enlarged upon the side towards the town; and barracks, which are bomb-proof, with several other conveniences for a siege, were erected. Upon the south side of the castle lies a park enclosed with

a stone wall called the King's Park, and near to the foot of the rock on which the castle stands lay the royal gardens, vestiges of the walks and parterres, with a few stumps of fruit trees, still visible; but by long neglect, and the natural wetness of the soil, the place is now little better than a marsh. In the gardens is a mound of earth in form of a table, with benches of earth round it, where, according to tradition, the court sometimes held fêtes champêtres. In the castle-hill is a hollow, comprehending about an acre of ground, and having all the appearance of an artificial work, which was used for jousts, tournaments, and other feats of chivalry. Northward of the castle lies the Govan, or Gowling Hill; in the middle of which is a small mound called Hurlly Haaky, upon which duke Murdoch and his two sons were executed for treason in the reign of James I. The prospect from the castle is delightful and extensive, being greatly beautified, especially upon the east, by the windings of the Forth, which are so many that though the distance by land from Stirling to Alloa is, in a straight line, not quite six miles, it is twenty-four by water. The lordship and castle of Stirling were a part of the usual dowry of the queens of Scotland, after the family of Stewart came to the throne, in which they were invested at their marriage. Robert lord Erskine was appointed governor of the castle by king David II., and the office continued in that family till 1715. This fortress has been the scene of many transactions. Being by its situation considered as a key to the northern parts of the kingdom, the possession of it was always esteemed of great importance. It was undoubtedly a place of strength when the art of war by ordnance was in its infancy; and it resisted the utmost efforts of the rebels in 1746. The street on the summit of the hill is, as we have said, broad and spacious, but the other streets of the present town are still narrow and irregular. Considerable improvements, however, have been made within the last twenty years. On the north side of the town several new streets have been laid out, in which many new buildings have been erected, on a modern and an improved plan; and in the old part of the town numbers of houses have also been rebuilt. At the south end of the town, on the way to St. Ninian's, has been lately built a number of elegant villas on each side of the road; those on the east side are said to be in Pitt Terrace, and those on the west in Melville Place. West of these, and separated from them by another road, have been built, and are now building, many fashionable houses, in a form something like an oblong, to which has been given the name of Wellington Place. The town is well supplied with excellent water, which is brought in pipes from the hills of Touch, somewhat more than three miles distant; and lately a new road was opened from the head of the High Street by Balenagiech, which, however, has proved to be of very little utility.

STIRLING, or STIRLINGSHIRE, a county of Scotland, of which Stirling is the capital. It is twenty miles long and twelve broad; being bounded on the west by part of Lennox and Clydesdale; on the east by Clackmannanshire, the Forth, and part of Lothian; on the south-east

by Lothian; and on the north by Monteith. The face of the country is open and agreeable, diversified by hills and dales, well watered with streams and rivers; the principal of which is the Forth, which rising near a high mountain called Ben Lomond, and running east, forms the Frith of Edinburgh. The south part is hilly, affording plenty of game, and pasturage for sheep, horses, and black cattle. The east part is fertile, producing plentiful harvests of corn, and great abundance of coal. Lead ore is found in different parts, and the rivers abound with pike, trout, and salmon.

STIRP, *n. s.* Lát. *stirps*. Race; family; generation. Not used.

Sundry nations got footing in that land, of which there yet remain divers great families and *stirps*.

Spenser.

Democracies are less subject to sedition than when there are *stirps* of nobles.

Bacon.

All nations of might and fame resorted hither; of whom we have some *stirps* and little tribes with us at this day.

Id.

STIRRUP, *n. s.* Sax. *ƿriƿenap*, *ƿriƿap*; from *ƿriƿan*, to climb, and *ƿap*, a cord. An iron hoop suspended by a strap, in which the horse-man sets his foot.

Neither is his manner of mounting unseemly, though he lack *stirrups*; for, in his getting up, his horse is still going, whereby he gaineth way: and therefore the *stirrup* was called so in scorn, as it were a stay to get up; being derived of the old English word *sty*, which is to get up, or mount.

Spenser.

Hast thou not kissed my hand, and held my *stirrup*?

Shakspeare.

His horse hipped with an old mothy saddle, the *stirrups* of no kindred.

Id. Taming of the Shrew.

My friend, judge not me, Thou seest I judge not thee.

Between the *stirrup* and the ground, Mercy I asked, mercy I found.

Cumden's Remains.

At this the knight began to cheer up, And, raising up himself on *stirrup*, Cried out, Victoria.

Hudibras.

STIRRUP (Fr. *étrier*), a well known iron frame fastened to a saddle with a thong of leather for the foot of the rider to rest upon.

It is observed in a publication, entitled the Sportsman's Dictionary, that you should bear vigorously upon your *stirrup* when you have your foot in it, and hold the point of your foot higher than your heel.

When you would stop your horse you must bear upon your *stirrups*.

You should keep your right *stirrup* half a point shorter than the left, for in combat the horseman bears and rests more upon the right; which also, from the weight of the sword, carbine, &c., renders that side heavier than the left, and the pressure consequently greater. Besides, in mounting, the facility is increased by the imperceptible length of the left *stirrup*.

To lose one's *STIRRUPS*, to suffer them to slip from the foot; this may happen from the cox-combical practice of resting upon the toe instead of the ball of the foot, which is the true fulcrum.

STIRRUP foot is the left foot.

STIRRUPS were unknown to the ancients. The want of them in getting upon horseback was supplied by agility or art. Some horses were taught

to stoop to take their riders up; but the riders often leaped up by the help of their spears, or were assisted by their slaves, or made use of ladders for the purpose. Gracchus filled the high-ways with stones, which were intended to answer the same end. The same was also required of the surveyors of the roads in Greece as part of their duty.

STIRRUP OF A SHIP, a piece of timber put upon a ship's keel when some of her keel happens to be beaten off and they cannot come conveniently to put or fit in a new piece, then they patch in a piece of timber, and bind it on with an iron, which goes under the ship's keel, and comes up on each side of the ship, where it is nailed strongly with spikes; and this they call a *stirrup*.

STITCH, *v. a. & n. s.* } Sax. *ƿrician*; Dan. *STITCHERY*, *n. s.* } *sticke*; Belg. *sticken*. Literally to prick: hence to sew; work with a needle on any thing; to join; unite: a *stitch* is a sharp pricking pain; a single pass of a needle; a link of yarn or thread; having a single ridge or furrow: *stitchery*, needle work.

It is in your hand as well to *stitch* up his life again, as it was before to rent it.

Sidney.

If you desire the spleen, and will laugh yourself into *stitches*, follow me; yond gull Malvolio is turned heathen, a very renegade.

Shakspeare. Twelfth Night

Come lay aside your *stitchery*; play the idle housewife with me this afternoon.

Id. Othello.

Many men at plow he made, and drave earth here and there,

And turned up *stitches* orderly.

Chapman's Iliads.

Having *stitched* together those animadversions touching architecture and their ornaments.

Wotton.

A simple bloody sputation of the lungs is differentiated from a pleurisy, which is ever painful, and attended with a *stitch*.

Harvey on Consumptions.

A *stitch*-fallen cheek, that hangs below the jaw, Such wrinkles as a skilful hand would draw For an old grandam ape.

Dryden.

There fell twenty *stitches* in his stocking.

Motteux.

I with a needle and thread *stitched* up the artery and the wound.

Wiseman's Surgery.

STITHY, *n. s.* Sax. *ƿrið*, hard; Isl. *stedie*. An anvil; the iron body on which the smith forges his work.

My imaginations are as foul As Vulcan's *stithy*.

Shakspeare. Hamlet.

STIVE, *v. a.* Supposed of the same original with *stew*. To stuff up close.

You would admire, if you saw them *stive* it in their ships.

Sandy's Journey.

His chamber was commonly *stived* with friends or suitors of one kind or other.

Wotton.

STOBÆUS (John), a laborious Greek writer, who lived at the end of the fourth century, composed many works, of which there are only his Collections remaining, and even these are not as he composed them, many things being inserted by later authors. This work contains many important sentiments collected from the ancient writers, poets, and philosophers, on which account it is much valued. The best editions are those of Aurel. Allob. folio, 1609, and Paris, 4to. 1623.

STOBI, a town of European Turkey, in Ma-

cedonia, in the ancient Pœonia, forty-two miles north of Edessa. It retains its ancient name.—Liv. 33. c. 19. l. 40, 41.

STO'CAH, *n. s.* Irish *stoach*; Erse *stockh*. An attendant; a wallet-boy; one who runs at a horseman's foot; a horseboy. Not in use.

He holdeth himself a gentleman, and scorneth to work, which he saith is the life of a peasant; but thenceforth becometh an horseboy or a *stocah* to some kern, inuring himself to his sword, and the gentlemanly trade of stealing. *Spenser*.

STOCCADE (Nicolas de Helt), an historical and portrait painter, born at Nimeguen in 1614. He studied under Riccaert and then went to Italy. His paintings are esteemed.

STOCCA'DO, *n. s.* Ital. *stoccato*, from *stocco*, a rapier. A thrust with the rapier.

You stand on distance, your passes, *stoccados*, and I know not what.

Shakespeare. Merry Wives of Windsor.

STOCK, *n. s. & v. a.* } Sax. *roc*; Goth. Swed. *Stoc*'**JOBBER**, *n. s.* } Teut. and Belg. *stock*;
STOCK'ISH, *adj.* } Fr. *estoc*. The trunk or
STOCK'LOCK, *n. s.* } body of a plant: hence
STOCK'STILL, *adj.* } a log; a post: the support of a ship while building; a very stupid man; the race or lineage of a family; any principal or capital store; body; quantity; a public fund: to stock is to store; lay up in store: 'stock up,' reduce to a mere stock: a stockjobber is a common jobber in the public funds: stockish, blockish; stupid: a stocklock, a lock fixed in a stock of wood: stockstill, motionless, as a stock.

There is hope of a tree, if cut down, that it will sprout again, though the root wax old in the earth, and the *stock* die in the ground. *Job xiv. 8.*

That furious beast

His precious horn, sought of his enemies,
 Strikes in the *stock*, ne thence can be released.

Spenser.

What tyranny is this, my heart to thrall,
 And eke my tongue with proud restraint to tie,
 That neither I may speak nor think at all,
 But like a stupid *stock* in silence die? *Id.*

While we admire

This virtue and this moral discipline,
 Let's be no stoicks, nor no *stocks*. *Shakespeare.*

Say what *stock* he springs of.
 —The noble house of Marcius. *Id. Coriolanus.*

The poet

Did feign that Orpheus drew trees, stones, and floods;
 Since nought so *stockish*, hard, and full of rage,
 But musick for the time doth change his nature.

Shakespeare.

Call not your *stocks* for me: I serve the king,
 On whose employment I was sent to you:
 You shall do small respect, shew to bold malice
 Against the grace and person of my master,
 Stocking his messenger. *Id. King Lear.*

A king, against a storm, must foresee to a convenient *stock* of treasure. *Bacon.*

The cion over-rueth the *stock* quite; and the *stock* is passive only, and giveth aliment, but no motion, to the graft. *Id.*

Prodigal men

Feel not their own *stock* wasting.
Ben Jonson's Catiline.

Thy mother was no goddess, nor thy *stock*
 From Dardanus; but in some horrid rock,
 Perfidious wretch, rough Caucasus thee bred.

Derham.

The wild boar not only spoils her branches, but *stocks* up her roots. *Decay of Piety.*

That they kept thy truth so pure of old,
 When all our fathers worshipped *stocks* and stones,
 Forget not. *Milton.*

Thou hast seen one world begin and end,
 And man, as from a second *stock*, proceed. *Id.*

His early virtues to that ancient *stock*
 Gave as much humour as from thence he took. *Waller.*

Fresh supplies of ships,
 And such as fitted since the fight had been,
 Or new from *stocks* were fallen into the road. *Dryden.*

Some honour of your own acquire;
 Add to that *stock*, which justly we bestow,
 Of those blest shades to whom you all things owe. *Id.*

Beneath one law bees live,
 And with one common *stock* their traffick drive:
 All is the state's, the state provides for all. *Id. Georgicks.*

I, who before with shepherds in the groves
 Sung to my oaten pipe their rural loves,
 Manured the glebe, and *stocked* the fruitful plain. *Dryden.*

If parents die without actually transferring their right to another, why does it not return to the common *stock* of mankind? *Locke.*

There are locks for several purposes; as street-door-locks, called *stocklocks*; chamber-door-locks, called spring-locks; and cupboard-locks.

Mozon's Mechanical Exercises.

The world begun to be *stocked* with people, and human industry drained those uninhabitable places. *Burnet.*

'Tis the place where God promises and delights to dispense larger proportions of his favour, that he may fix a mark of honour on his sanctuary, and recommend it to the sons of men, upon the *stock* of their own interest as well as his own glory. *South.*

If a man will commit such rules to his memory, and *stock* his mind with portions of scripture answerable to all the heads of duty, his conscience can never be at a loss. *Id.*

Our preachers stand *stockstill* in the pulpit, and will not so much as move a finger to set off the best sermon. *Addison.*

When we brought it out, it took such a quantity of air into its lungs that it swelled almost twice as big as before; and it was perhaps on this *stock* of air that it lived a minute longer the second time. *Id. On Italy.*

Why all this fury? What's the matter,
 That oaks must come from Thrace to dance?
 Must stupid *stocks* be taught to flatter?
 And is there no such wood in France? *Prior.*

Of those stars, which our imperfect eye
 Has doomed and fixed to one eternal sky,
 Each, by a native *stock* of honour great,
 May dart strong influence, and diffuse kind heat. *Id.*

Springs and rivers are by large supplies continually *stocked* with water. *Woodward.*

Be ready to give, and glad to distribute, by setting apart something out of thy *stock* for the use of some charities. *Atterbury.*

They had law-suits; but, though they spent their income, they never mortgaged the *stock*. *Arbutnot.*

He proposes to himself no small *stock* of fame in future ages, in being the first who has undertaken this design. *Id.*

As fruits ungrateful to the planter's care,
 On savage *stocks* inserted, learn to bear;

The surest virtues thus from passions shoot,
Wild nature's vigour working at the root. *Pope.*

Statesman and patriot ply alike the stocks,
Peeres and butler share alike the box. *Id.*

An artificial wealth of funds and stocks was in the hands of those who had been plundering the publick. *Swift.*

The stockjobber thus from 'Change-alley goes down,
And tips you the freemen a wink;
Let me have but your vote to serve for the town,
And here is a guinea to drink. *Id.*

She has divided part of her state amongst them,
that every one may be charitable out of their own stock, and each of them take it in their turns to provide for the poor and sick of the parish. *Luv.*

STOCK, *n. s.* } Swed. *sticka*; Belg. *stikken*,
STOCK'ING, } to knit. Stock, in the old lan-
STOCKS. } guage, made the plural stocken,
which was used for a pair of stocks or covers for the legs. Stocken was in time taken for a singular, and pronounced stocking. The like corruption has happened to chick, chicken, chickens. The cravat or cloth of the neck; a covering of the leg: stocks are a prison for the legs.

In his first approach before my lady he will come to her in yellow stockings, and 'tis a colour she abhors. *Shakspeare.*

His lackey with a linen stock on one leg, and a kersey boot hose on the other. *Id. Taming of the Shrew.*

Fetch forth the stocks:

As I have life and honour, there shall he sit till noon. *Shakspeare.*

Matrimony is expressed by a young man standing, his legs being fast in a pair of stocks. *Peacham.*

By the loyalty of that town he procured shoes, stockings, and money for his soldiers. *Clarendon.*

Unless we should expect that nature should make jenkins and stockings grow out of the ground, what could she do better than afford us so fit materials for cloathing as the wool of sheep?

More against Atheism.
Stockinged with loads of fat town dirt he goes. *Dryden.*

Stock-doves and turtles tell their amorous pain,
And, from the lofty elm of love complain. *Id.*

He spent half a day to look for his odd stocking,
when he had them both upon a leg. *L'Estrange.*

The stocks hinder his legs from obeying the determination of his mind, if it would transfer his body to another place. *Locke.*

At amorous Flavio is the stocking thrown;
That very night he longs to lie alone. *Pope.*

The families of farmers live in the filth and nastiness, without a shoe or stocking to their feet. *Swift.*

Stock, in gardening, &c. What stock is most proper for each kind of fruit, ought as well to be considered and known, as what soil is most suitable to trees; for on these two things the future vigor of trees and the goodness of fruit equally depend. The best way for those who intend to plant is to raise their own stocks, by which they will be better assured of what they do; but, if they should buy their trees of nurserymen, they should diligently enquire upon what stocks they were propagated. See GRAFTING.

STOCK (Christian), a celebrated German philologist, born at Camburg in 1672. He became a professor in the university of Jena. He published, 1. *Dissertationes de poenis Hebræorum capitali-*

bus; 2. *Clavis Linguae Sanctae veteris Testamenti*; 3. *Clavis Linguae Sanctae Novi Testamenti*. He died in 1733.

STOCKDALE (Percival), rev., was a native of Branxton, in Northumberland, where he was born about the year 1736. He was sent into Scotland for education, and studied at St. Andrew's, where he graduated, but afterwards embraced a military life, and served abroad. At length, on his return to England, he recurred to the line of life for which he had been originally designed, and entered the church in 1759. Settling in London, he for some time continued to support himself by combining the profession of an author with that of a clergyman, till he again entered the king's service, in the capacity of chaplain to a ship, and eventually obtained the livings of Long Houghton and Lesbury in his own county. He published a series of Lectures on the Poets, an Essay on the Genius of Pope, and a Biographical Memoir of Waller, besides a volume of miscellaneous poems of no great merit, and a few sermons. He also wrote his own life with a sufficient portion of vanity. His death took place at the rectory house, in Long Houghton, in 1811.

STOCKHOLM, the capital of Sweden, is situated at the junction of the lake Maelar with an inlet of the Baltic. Its form is an irregular oblong, extending from north to south; the waters cross it in two channels from east to west. The situation is extremely picturesque. Stockholm, strictly speaking, stands on three islands; as, one large one to the southward called Sodermalm, a small one in the centre, another somewhat larger to the north-west, and a track of the mainland to the north, called Norrmalm. The smaller islands, or rather islets, contain forts or buildings for naval purposes.

The central island constituted the old city, and is still the most busy part of the town, its quays being bordered by a stately range of buildings, the residences of the principal merchants. It contains the palace and other public buildings; but, its houses being high and its streets narrow, its appearance is somewhat gloomy. We soon after, however, enter on the long streets of the Norrmalm. Of these the principal is Queen's Street, extending in a straight line more than a mile from the observatory to the side of the lake. In this part of the town are the prince's palace, the opera house, and in the centre of a square, a bronze equestrian statue of Gustavus Adolphus. The streets are at right angles to each other, but several of them are narrow and indifferently paved; a remark applicable also to the Sodermalm, or southern division of the city, which contains but few public buildings, but has, on an eminence called the Mount of Moses, a view displaying an assemblage of rocks, houses, plantations, ships, and water, in all the variety of romantic scenery. The number of bridges, great and small, is twelve. The houses are built in the central part of the town, either of stone or of brick covered with plaster. Their foundations are on piles; their height seldom less than four or five stories; but in the suburbs they are of only one or two stories, and a number of them are of wood.

The principal public building is the royal palace, a large quadrangular structure, with a square or court in the middle. The situation is elevated, and the style of the architecture grand but simple. The lower part of the walls is of polished granite, and, though the upper part is of brick, a covering of stucco gives it the appearance of stone; the roof, like that of a number of public buildings in Sweden, is of copper. In one of the halls are preserved certain relics of antiquity, brought from Italy by Gustavus III. (father of the king deposed in 1809), comprising a number of statues; among others the famous Endymion discovered in the Villa Adriana. At a short distance, on the quays, stands a fine bronze statue of Gustavus III., raised on a pedestal of polished porphyry. The palace, or house of assembling for the nobility, is an elegant edifice, ornamented on the outside with marble statues and columns, in the inside with paintings and sculptures. The arsenal, situated in a pleasant promenade called the king's garden, contains a number of trophies of the brilliant days of the Swedish monarchy, and other objects, interesting from their connexion with the history of the country. The bank, built at the expense of the city, the mint, and the exchange, are all entitled to the notice of a stranger. After this come the hotel de ville, the royal stables, the great dépôt or warehouse for iron, the hospitals and philanthropic institutions. The churches are substantial, and in some cases elegant; but it would be difficult to point out any one of them particularly remarkable for size, architecture, or decorations.

The literary societies of Stockholm are very respectable bodies. The academy of sciences, founded in 1739 by a small association which counted Linnæus among its members, comprises 100 native and sixty foreign members. Its objects were originally agriculture, trade, and manufactures, but to these it subsequently added the mathematical and philosophical sciences. Its observatory, situated on an eminence in the upper part of the town, affords a beautiful prospect. The Swedish academy, founded by Gustavus III. in 1786, is on a more limited scale, comprising only eighteen members, and confining its labors to the improvement of the Swedish language, and to fixing, by the composition of a grammar and dictionary, on the plan of the academy of France, the standard of vernacular composition. Next in rank is the academy of fine arts, history, and antiquities; a military academy, a patriotic and an agricultural society, an academy for painting and sculpture, and, finally, an academy of music. Here is also a medical college, exercising a superintendence over the medical establishments of the kingdom at large. Of collections, the most interesting are the royal library (about 40,000 volumes), the cabinet of minerals, and the zoological cabinet. This city contains also a more than usual number of private collections.

Stockholm is the emporium of the central part of Sweden—the place to which its products are brought for export. Few harbours have greater depth or capacity. The only drawback on the navigation arises from the number of small islands and detached rocks at the mouth of the inlet from the Baltic and its winding channel. The number

of vessels that enter the harbour annually is averaged at 1000. The chief exports are iron, steel, copper, pitch, tar, and timber; the imports, colonial produce, wine, fruit, salt, and, in a limited degree, British manufactures. The extent of inland trade becomes considerable even in this country, by the length of the lake, which extends sixty miles into the interior, with a much further prolongation by the canals of Arboga and Stroemsholm. Iron and steel articles are the chief exports. The timber is not so large as that in the southern parts of the Baltic.

The manufactures of this city are iron foundries, glass-works, sugar refineries; also leather, cotton, hats, stockings, silk, watches, clocks, mathematical instruments, articles of gold and silver. Plates are likewise made in this city. Of late years the trade of the capital, as of the kingdom at large, has been greatly cramped by restrictions imposed partly in England, to favor the import of timber from Canada, and partly in Sweden.

Stockholm was founded in the thirteenth century and owed its increase to the commercial advantages of its situation, the court having continued at Upsal until the seventeenth century. Since that period Stockholm has been the seat of government and the centre of commerce of the whole country. The population of the whole city and suburbs approaches to 80,000. 320 miles north-east of Copenhagen, 420 west of St Petersburg, and 850 north-east of London. Long of the observatory 18° 3' 30" E., lat. 59° 20' 31" N.

STOCKHOLM, an extensive province of Sweden, comprising the eastern parts of Upland and Sudermania, or the districts of Roslagen and Sodertern, having an area of 2736 square miles, with 100,000 inhabitants. The city of Stockholm, with a small territory surrounding it, forms, however, a separate government.

STOCKINGS anciently were made of cloth, or of milled stuffs sewed together; but since the invention of knitting and weaving stockings of silk, wool, cotton, thread, &c., the use of cloth stockings is given up. Dr. Howel in his History of the World, vol. ii. p. 222, relates that queen Elizabeth, in 1501, was presented with a pair of black knit silk stockings by her silk woman, and thenceforth never wore cloth ones. He adds that Henry VIII. ordinarily wore cloth hose, except there came from Spain a pair of silk stockings. Edward VI. was presented with a pair of silk stockings by Sir Thomas Gresham, and the present was then much taken notice of. Hence it is said that the invention of knit silk stockings originally came from Spain. Others relate that one William Rider, an apprentice on London bridge, seeing at the house of an Italian merchant a pair of knit worsted stockings from Mantua, took the hint, and made a pair exactly like them, which he presented to William earl of Pembroke, and that they were the first of that kind worn in England in 1564. The modern stockings, woven or knit, are formed of an infinite number of little knots, called stitches, loops, or meshes, intermingled. Knit stockings are wrought with needles made of polished iron, or brass wire, which interweave the threads and form the meshes the stocking consists of. When the art

of knitting was invented is not determined, though it has been attributed to the Scots, as it is said that the first works of this kind came from Scotland. It is added that, on this account, the company of stocking-knitters, established at Paris in 1527, took for their patron St. Fiacre, the son of a king of Scotland. Woven stockings are generally very fine; they are manufactured in a machine made of polished iron, the structure of which it is needless to describe, as it may be seen in almost every considerable town in Great Britain. The invention of this machine is, by Mr. Anderson, attributed to William Lee, M. A. of St. John's College, Cambridge, at a period so early as 1589. Others give the credit of it to a student at Oxford at a much later period, who, it is said by Aaron Hill, was driven to it by dire necessity. This young man falling in love with an innkeeper's daughter, married her, though she had not a penny, and he by his marriage lost a fellowship. They soon fell into extreme poverty; and, their marriage producing the consequences naturally to be expected from it, the amorous pair became miserable, not so much on account of their sufferings, as from the melancholy dread of what would become of their yet unborn infant. Their only means of support was the knitting of stockings, at which the woman was very expert: 'But sitting constantly together from morning to night, and the scholar often fixing his eyes, with steadfast observation, on the motion of his wife's fingers in the dexterous management of her needles, he took it into his imagination that it was not impossible to contrive a little loom which might do the work with much more expedition. This thought he communicated to his wife, and joining his head to her hands, the endeavour succeeded to their wish. Thus the ingenious stocking loom, which is so common now, was first invented, by which he did not only make himself and his family happy, but has left his nation indebted to him for a benefit which enables us to export silk stockings in great quantities, and to a vast advantage, to those very countries whence before we used to bring them at a considerable loss in the balance of our traffic.'

STOCKPORT, a large Borough town and parish in the hundred of Macclesfield, Cheshire, situated on the river Mersey; it is strictly speaking partly in Cheshire, and partly also in Lancashire, the portion in the latter county being called Heaton Norris, and united to the Cheshire part by two stone bridges over the river. On the advance of prince Charles, and his forces from Manchester, in the year 1745, Stockport old bridge was broken down to impede the march of the rebels, and the prince was obliged to ford the Mersey, immersed to the waist in water. Stockport was a Roman station, the site of whose citadel stood upon the Castle Hill. Mr. Ormrod conjectures that Stockport was laid waste at the Norman conquest, and in this way accounts for the name not occurring in Domesday Book. The town gathered round the castle in the time of the Dispensers, and was made a free borough by Robert de Stokeport with the permission of Edward I., earl of Chester. A mayor is regularly appointed, but the office is now little more than nominal. The manorial rights at present

(1828) belong to the honorable Francis Maria Warren of Poynton. The police of the town managed by resident and neighbouring magistrates, two constables, four overseers of the poor, and four permanent churchwardens, together with commissioners of an act of parliament for better regulating the town, obtained in the sessions of 1826. It has also its gas company, as well as water works, both incorporated in the year 1825, the latter is the property of one individual. It returns two members to Parliament.

There are three churches. The parish church of St. Mary's is a fine Gothic building erected under the authority of the act of Geo. III. c. 165, on the site of the ancient edifice. St. Peter's is a plain but handsome brick building, erected at the sole expense of William Wright, esq., in the year 1765. The new fine and commodious church of St. Thomas's, built at a cost of £14,000, by the commissioners under an act for erecting additional churches, was opened for divine service September 1825. The town besides these contain four Methodist chapels, one of which built on the Lancashire side of the river, has a school room under it opened August 1826; and one belongs to the new connexion or followers of Kilham, another to the primitive Methodists or Ranters. Three Independent (one of these is also built on the Lancashire side). One Friends' meeting-house, one Baptist, one Catholic, and one Unitarian chapel: to most of these they have their Sunday-schools attached, also a large school 132 feet by fifty-seven for all denominations of children, built in 1805. The national school, built by subscription in the year 1826 at a cost of upwards of £5,500, is well situated on the new line of London and Manchester road; this road is connected to the Lancashire side by a bridge of eleven arches, which passes over several streets as well as the river, the height from the level of the water is forty-seven feet. The free grammar school was founded in the year 1487, by Sir Edmund Shaw, goldsmith and alderman of London. Has also its dispensary and fever wards.

The parish of Stockport contains fourteen townships, viz. Stockport, Bramhall, Bredbury, Brinnington, Disley, Duckinfield Etchells, or Stockport Etchells, Hyde, Marple, Norbury, Offerton, Romiley, Torkington, and Werneth. Silk was the original manufacture of this town, and the first mills in England for winding and throwing silk on the stalion principle are said to have been established here. The superior advantages of the cotton trade induced the proprietors at a subsequent period to turn their machinery to the spinning of cotton, and is now the staple manufacture of the place, together with the power loom weaving. In the year 1825 a calculation was made of them, being seventy steam engines of the power of 1960 horses; within the same limits there were 5730 power looms for weaving calicoes and shirtings, chiefly worked by such steam engines.

Stockport is seven miles south-east of Manchester, and 179 N. N. W. of London.

STOCKS, or public funds, in England. By the word stock was originally meant a particular

sum of money contributed to the establishing of a fund to enable a company to carry on a certain trade, by means of which the person became a partner in that trade, and received a share of the profit made thereby, in proportion to the money employed. But this term has been extended farther, though improperly, to signify any sum of money which has been lent to the government, on condition of receiving a certain interest till the money is repaid, and which makes a part of the national debt. As the security both of the government and of the public companies is esteemed preferable to that of any private person, as the stocks are negociable and may be sold at any time, and as the interest is always punctually paid when due; so they are thereby enabled to borrow money on a lower interest than what could be obtained from lending it to private persons, where there must be always some danger of losing both principal and interest. But as every capital stock or fund of a company is raised for a particular purpose, and limited by parliament to a certain sum, it necessarily follows that when that fund is completed no stock can be bought of the company; though shares already purchased may be transferred from one person to another. This being the case, there is frequently a great disproportion between the original value of the shares and what is given for them when transferred; for, if there are more buyers than sellers, a person who is indifferent about selling will not part with his share without a considerable profit to himself; and, on the contrary, if many are disposed to sell, and few inclined to buy, the value of such shares will naturally fall in proportion to the impatience of those who want to turn their stock into specie. A stock may likewise be affected by the court of chancery; for, if that court should order the money, which is under their direction, to be laid out in any particular stock, that stock, by having more purchasers, will be raised to a higher price than any other of the like value. Hence the reader will perceive how much the credit and interest of the nation depend on the support of the public funds. While the annuities and interest for money advanced are there regularly paid, and the principal insured by both prince and people (a security not to be had in other nations), foreigners will lend us their property, and all Europe be interested in our welfare; the paper of the companies will be converted into money and merchandise, and Great Britain can never want cash to carry on her necessary expences either for peace or war.

Stocks, n. s. Ital. *stocco*, a rapier. Thrust; a *stoccado*.

To see thee here, to see thee there; to see thee pass thy puncto, thy stock thy reverse. *Shakspeare*.

Stocks, a frame erected on the shore of a river or harbour, whereon to build shipping. It generally consists of a number of wooden blocks, ranged parallel to each other, at convenient distances, and with a gradual declivity towards the water.

Stocks, a wooden machine to put the legs of offenders in, for securing disorderly persons, and

by way of punishment in divers cases, ordained by statute, &c.

STOCKTON, a market town in Stockton ward, Durham, situate on the river Tees, four miles from Yarm, and 241 north of London. It consists chiefly of one main street, nearly half a mile long and sixty yards broad, the houses being neatly built of brick; it is considered, by its recent improvements, to be the handsomest town in the north of England. In the centre of this street stands the town house, a handsome building erected in 1744, in which is a court room, an elegant suite of assembly rooms, and other apartments for public uses; adjoining it is a commodious piazza for the use of the market. South of the town-house is a handsome column of the Doric order, thirty-three feet high, where the market is held. There are several inferior streets, or rather lanes, leading to the river, where there is a custom-house under the proper officers. The whole of the town is well paved, and lighted with gas. The church is a handsome brick structure. At the west end is a tower, eighty feet high, containing six bells. The whole was erected in 1712, previous to which it was only a chapelry to the mother church of Norton. Here is a grammar and charity school. Several alms houses, a public dispensary, and many other useful and benevolent institutions. The bridge over the Tees is an elegant structure of five arches, the span of the centre arch being seventy-two feet, twenty-three feet high from low water, and twenty-one feet broad; it was finished in 1771. Opposite the church is a Presbyterian meeting-house. In the outskirts of the town are a Quaker's meeting-house, a Roman Catholic chapel, a large chapel for Methodists, and a small one for Baptists. The manufactures of Stockton are principally those of sail-cloth, ropes, damask, drapery, huck-aback, and linen, &c., besides which it carries on trade to a great extent with the Baltic, Hamburg, Norway, and Holland. Vessels from forty to 400 tons are annually built here. Its ancient castle was dismantled during the civil war, and the only stone houses in Stockton have been built from its ruins. The borough is governed by a mayor, alderman, and a recorder, who is always steward of the bishop's courts leet and baron. That part which constitutes the borough is all freehold; and the other buildings added to the original town are copyhold or leasehold, under the vicar, and not within the jurisdiction of the borough; each part having its distinct constable. Here are two banks, the Stockton and Cleveland, and the Tees banks. The market day on Wednesday is well supplied with corn, coal, provisions, and vegetables. The church is a vicarage, under the bishop of Durham, and having been made a parish, by a late act of parliament, it pays one-third part of the first fruits, tenths, &c., for the parish of Norton, as a recompense for its separation.

STOFBE, bastard Ethiopian elchrysum, a genus of plants belonging to the class of syngenesia, and order of polygamia segregata; and in the natural system ranging under the forty-ninth order, *compositæ*. The calycle is uniflorous.

rous; the corollets are tubular and hermaphroditic; the receptacle is naked, and the pappus is feathery. There are nine species; viz, 1. *S. Æthiopica*; 2. *disticha*; 3. *ericoides*; 4. *gnaphaloides*; 5. *gomphaloides*; 6. *prostrata*; 7. *reflexa*; 8. *rhinocerotis*; and, 9. *scabra*. They are all natives of foreign countries.

STOECHADES, in ancient geography, five small islands in the Mediterranean, on the coast of Gaul (Lucan. iii. 516, Strabo 4), now called Hieres. See **HIERES**.

STOENI, an ancient nation, who lived among the Alps.

STÖFLER (John), a German mathematician, born in Suabia, in 1452. He taught mathematics at Tubingen, and published several books with great reputation; but, being addicted to astrology, he sunk his fame, as Nathaniel Brassey Halhed, esq., did in our own day, by predicting a great deluge to happen in 1524, which excited a general terror all over Europe. He lived to see himself laughed at, by the failure of his prophecy; and died in 1531.

STOICS, the name given to a sect of Grecian philosophers, from *Στοα*, the porch in Athens, which the founder of the sect chose for his school. For the peculiar tenets of this sect, see **MORAL PHILOSOPHY**, and **ZENO**.

STOKESLEY, a market town and parish in Langbarough wap. North Riding of York, seven miles from Yarm, and 235 north-west from London. It consists of one well-built and long street, on the banks of the Wisk, which flows to the Tees. A modern church has been built at the eastern extremity of the town. Petty sessions are held here. The town became a place of consequence so early as the Norman conquest. Market on Saturday. Fairs, Saturday before Palm Sunday, first Saturday after May 4th, and once a fortnight till Saturday before Trinity Sunday, the first Saturday in October, and the second Saturday in November.

STOKE-UPON-TRENT, a town and parish of England, in the county of Stafford, and in the north division of the hundred of Prirerhill. It is a place of considerable traffic, situated within two miles of Newcastle-under-line, and 152 miles from London. Extensive potteries are established here; and traffic is much promoted by the navigable river Trent, and the Mersey canal, which pass by the place, and on the forum of which, are several potteries. There are two churches; the more ancient containing a tablet to the memory of Josiah Wedgewood, of Etruria; and the living is a rectory in the diocese of Lichfield and Coventry. The Independents, Wesleyans, and New Connexion Methodists, have chapels here. The population amounts to 52,946; and, by the provisions of the Reform Bill, this town returns two members to parliament.

STOLE, *n. s.* Lat. *stola*. A long vest.

STOLE, a sacerdotal ornament worn by the Romish parish priests above their surplice, as a mark of superiority in their respective churches; and by other priests over the alb, at celebrating of mass, in which case it goes across the stomach; and by deacons over the left shoulder, scarf wise; when the priest reads the gospel for

any one, he lays the bottom of his stole on his head. The stole is a broad swath, or slip of stuff, hanging from the neck to the feet, with three crosses thereon.

STOLE, GROOM OF THE, the eldest gentleman of his majesty's bed-chamber, whose office it is to present and put on his majesty's first garment, or shirt, every morning, and to order the things in the chamber.

STOLIDITY, *n. s.* Fr. *stolidité*; Lat. *stolidus*. Stupidity; want of sense.

STOM'ACH, *n. s., v. a., & v. n.* Fr. *estomach*; Lat. *stomachus*.

STOM'ACHED, *adj.*

STOM'ACHER, *n. s. & adj.*

STOM'ACHFUL,

STOMACH'ICAL,

STOM'ACHIC,

STOM'ACHOUS.

petite or desire of food: hence inclination; liking; dislike; anger; violence or sullenness of temper; pride: to stomach is to resent; as a verb neuter, to be angry: stomached, filled with resentment: stomacher, a female covering of the stomach or breast: stomachful, sullen; obstinate: stomachic and stomachical, relating to or adapted for the stomach: stomachous, sullen; stout; stubborn.

Instead of a *stomacher*, a girding of sackcloth.

Isa. iii. 24.

That stranger knight in presence came,
And goodly salved them; but nought again
Him answered, as courtesy became;
But with stern looks, and *stomachous* disdain,
Gave signs of grudge and discontentment vain.

Spenser.

Disdain he called was, and did disdain
To be so called, and who so did him call:
Stern was his look, and full of *stomach* vain,
His portance terrible, and stature tall.

Id.

If you are sick at sea,
Or *stomach*-qualmed at land, a dram of this
Will drive away distemper.

Shakspeare. Cymbeline.

Tell me, what is 't that takes from thee
Thy *stomach*, pleasure, and thy golden sleep?

Shakspeare.

He which hath no *stomach* to this fight,
Let him depart.

Id. Henry V

He was a man
Of an unbounded *stomach*, ever ranking
Himself with princes.

Id. Henry VIII.

High *stomached* are they both, and full of ire;
In rage deaf as the sea, hasty as fire.

Shakspeare.

Golden quoifs and *stomachers*,
For my lads to give their dears.

Id. Winter's Tale.

The unusual distance of time made it subject to every man's note, that it was an act against his *stomach*, and put upon him by necessity of state.

Bacon's Henry VII.

Thou marry'st every year
The lyric lark, and the grave whispering dove,
The sparrow that neglects his life for love,
The household bird with the red *stomacher*.

Donne.

Instead of trumpet and of drum,
That makes the warrior's *stomach* come.

Butler.

A *stomachful* boy, put to school, the whole world could not bring to pronounce the first letter.

L'Estrange.

The lion began to show his teeth, and to *stomach* the affront.

Id.

The very trade went against his *stomach*.
Not courage, but *stomach*, that makes people break rather than they will bend.

Id.

This sort of crying proceeding from pride, obstinacy, and *stomach*, the will where the fault lies, must be bent.

Locke.

Obstinate or *stomachful* crying should not be permitted, because it is another way of encouraging those passions which 'tis our business to subdue.

Id.

This filthy simile, this beastly line,
Quite turns my *stomach*.

Pope.

By a catarrh the *stomachical* ferment is vitiated.

Floyer.

STOMACH, in anatomy, is a membranous receptacle, situated in the epigastric region, which receives the food from the œsophagus; its figure is somewhat oblong and round: it is largest on the left side, and gradually diminishes towards its lower orifice, where it is the least. Its superior orifice, where the œsophagus terminates, is called the *cardia*; the inferior orifice, where the intestine begins, the *pylorus*. The anterior surface is turned towards the abdominal muscles, and the posterior opposite the lumbar vertebrae. It has two curvatures: the first is called the great curvature of the stomach, and extends downwards from one orifice to the other, having the omentum adhering to it; the second is the small curvature, which is also between both orifices, but superiorly and posteriorly. The stomach, like the intestinal canal, is composed of three coats, or membranes: 1. The outermost, which is very firm, and from the peritonæum. 2. The muscular, which is very thick, and composed of various muscular fibres; and, 3. The innermost, or villous coat, which is covered with exhaling and inhaling vessels, and mucous. These coats are connected together by cellular membrane. The glands of the stomach which separate the mucous are situated between the villous and muscular coat, in the cellular structure. The arteries of the stomach come chiefly from the cœliac artery, and are distinguished into the coronary, gastro-epiploic, and short arteries; they are accompanied by veins which have similar names, and which terminate in the *vena portæ*. The nerves of the stomach are very numerous, and come from the eighth pair and intercostal nerves. The lymphatic vessels are distributed throughout the whole substance, and proceed immediately to the thoracic duct. The use of the stomach is to excite hunger and partly thirst, to receive the food from the œsophagus, and to retain it, till, by the motion of the stomach, the admixture of various fluids, and many other changes, it is rendered fit to pass the right orifice of the stomach, and afford chyle to the intestines. See **ANATOMY**, Index.

STOMACHICA PASSIO, a disorder in which there is an aversion to food; even the thought of it begets a nausea, anxiety, cardialgia, an effusion of saliva, and often a vomiting. Fasting is more tolerable than eating; if obliged to eat, a pain follows that is worse than hunger itself.

STOMACHICS are medicines that strengthen the stomach and promote digestion, &c. Stomachic corroboratives are such as strengthen the tone of the stomach and intestines; among which are carminatives, as the roots of galangals, red gentian, zedoary, pimpinella, calamus aromaticus, and arum. Of barks and rinds, those of canella alba, sassafras, citrons, Seville and China oranges, &c. Of spices, pepper, ginger, cloves, cinnamon, cardamums, and mace. All these will be found occasionally useful, but the best of all corroboratives, according to the new system of medicine, are air, exercise, and fresh animal food; which last, when the stomach is too weak to digest it in a solid form, should be given in the form of beef tea or veal or chicken broth.

STOND, *n. s.* For stand. Post; station. Obsolete.

On the other side, the assieged castle's ward
Their stedfast *stonds* did mightily maintain. *Spenser.*

There be not *stonds* nor restiveness in a man's nature; but the wheels of his mind keep way with the wheels of his fortune.

Bacon's Essays.

STONE, *n. s., adj., & v. a.*

STONECROP, *n. s.*

STONECUTTER,

STONEFRUIT,

STONEHORSE,

STONEPIT,

STONEPITCH,

STONEWORK,

STONINESS,

STONY, *adj.*

Saxon *stan*;
Gothic *stain*;
Belgic *steen*;
Swedish *sten*;
Teut. *stein*. A
body insipid,
hard, not ductile
or malleable,
nor soluble in
water.—Wood-

ward. A piece of building stone; a monument; a gem; a calculous secretion; the disease arising therefrom; the case of certain seeds; testicle; a weight (for which a stone was formerly used); a state of insensibility: 'to leave no stone unturned' is to do all we can to produce an effect: stone, adjective, is made of stone: to stone, to pelt; beat; kill with stones; also to harden: a stonecrop is a kind of tree: a stone-cutter, one whose trade is to hew or cut stones: stonefruit, that which contains a stone: stonehorse, a horse not castrated: stonepit a quarry: stonpitch, hard inspissated pitch; the other noun substantives and the adjectives correspond.

These people be almost ready to *stone* me.

Ezod. xvii. 4.

Now let the *stony* dart of senseless cold
Pierce to my heart and pass through every side.

Spenser.

The *stony* hardness of too many patrons' hearts,
not touched with any feeling in this case. *Hooker.*

Eight yards of uneven ground is threescore and ten miles a-foot with me, and the *stony* hearted villains know it.

Shakespeare.

Oh perjured woman! thou dost *stone* my heart;
And mak'st me call what I intend to do
A murder, which I thought a sacrifice. *Id. Othello.*

I thought I saw

Wedges of gold, great anchors, heaps of pearl,
Inestimable *stones*, unvalued jewels.

Id. Richard III.

With love's light wings did I o'erperch these
walls;

For *stony* limits cannot hold love out.

Id. Romeo and Juliet

Present her at the leet,
Because she bought *stone* jugs, and no sealed quarts.
Shakspeare.

What need you be so boisterous rough ?
I will not struggle, I will stand *stone* still.
Id. King John.

The Egyptian mummies are reported to be as hard
as *stonepitch*. *Bacon's Natural History.*

To make fruits without core or *stone* is a curiosity.
Bacon.

The English used the *stones* to reinforce the pier.
Huyward.

Five sharp smooth *stones* from the next brook he
chose,
And fits them to his sling. *Cowley.*

He hath some *stonyness* at the bottom. *Hammond.*
Nor slept the winds

Within their *stony* caves, but rushed abroad
From the four hinges of the world, and fell
On the vext wilderness, whose tallest pines,
Though rooted deep as high and sturdiest oaks,
Bowed their stiff necks, loaden with stormy blasts,
Or torn up sheer. *Milton's Paradise Regained.*

From the *stony* Mænalus
Bring your flocks, and live with us. *Milton.*

And there lies Whacum by my side,
Stone dead, and in his own blood dyed. *Hudibras.*

Women, that *left no stone unturned*
In which the cause might be concerned,
Brought in their childrens' spoons and whistles,
To purchase swords, carbines, and pistols. *Id.*

We gathered ripe apricocks and ripe plums upon
one tree, from which we expect some other sorts of
stonefruit. *Boyle.*

A specifick remedy for preventing of the *stone*,
I take to be the constant use of alehoof-ale. *Temple.*

He crimes invented, *left unturned no stone*
To make my guilt appear, and hide his own.
Dryden.

As in spires he stood, he turned to *stone* ;
The *stony* snake retained the figure still his own.
Id.

She had got a trick of holding her breath, and
lying at her length for *stone* dead. *L'Estrange.*

Small gravel or *stoniness* is found therein.
Mortimer.

They make two walls with flat *stones*, and fill the
space with earth, and so they continue the *stonework*.
Id.

Where there is most arable land, *stonehorses* or
geldings are more necessary. *Id. Husbandry.*

Stonecrop tree is a beautiful tree, but not common.
Mortimer.

Relentless time, destroying power,
Whom *stone* and brass obey. *Parnel.*

There is one found in a *stonepit*. *Woodward.*

They suppose these bodies to be only water petri-
fied, or converted into these sparry or *stony* icicles.
Id.

A gentleman supposed his difficulty in urining pro-
ceeded from the *stone*. *Wiseman's Surgery.*

A *stonecutter's* man had the vesiculæ of his lungs
so stuffed with dust, that, in cutting, the knife went
as if through a heap of sand.

Derham's Physico-Theology.

Crucifixion was a punishment unknown to the
Jewish laws, among whom the *stoning* to death was
the punishment for blasphemy. *Stephens's Sermons.*

The name Hexton owes its original to the *stoniness*
of the place. *Hearne.*

Should some relenting eye
Glance on the *stone* where our cold reliques lie.

Pope.
Id.

I have not yet forgot myself to *stone*.

The cottagers, having taken a country-dance toge-
ther, had been all out, and stood *stone* still with
amazement. *Id.*

My prosecutor provided me a monument at the
stonecutter's and would have erected it in the parish
church. *Swift.*

Indifference clad in wisdom's guise,
All fortitude of mind supplies ;
For how can *stony* bowels melt,
In those who never pity felt ? *Id.*

In the next place there are they who are described
as having received the seed in a *stony* soil, or on a
rock under a very shallow bed of earth : such, I
mean, who having heard the message of pardon, life,
and glory, which the word of the gospel brings, im-
mediately receive it with a transport of joy—but, as
they have no root of deep conviction and real love to
holiness in themselves, they have no true impression
of the power of it on their hearts.

Doddridge on Matt. xiii.

STONE (Edmund), a distinguished self-
taught mathematician, was born in Scotland ; but
neither the place nor time of his birth are well
known ; but it is said on the authority of Che-
valier Ramsay, author of the Travels of Cyrus,
that he was son of a gardener of the duke of
Argyle. At eighteen years of age his ac-
quired merits were discovered by the duke,
who drew him out of his obscurity, and provided
him with an employment which left him plenty
of time to apply himself to the sciences. Mr.
Stone was author and translator of several useful
works ; viz. 1. A New Mathematical Dictionary,
in 1 vol. 8vo., first printed in 1726. 2. Fluxions,
in 1 vol. 8vo., 1730. The Direct Method is a
translation from the French, of Hospital's Ana-
lyse des Infiniments Petits ; and the Inverse
Method was supplied by Stone himself. 3. The
Elements of Euclid, in 2 vols. 8vo., 1731 ; with
an account of the life and writings of Euclid,
and a defence of his elements against modern
objectors ; with other smaller works. Stone was
F. R. S., and had inserted in the Philosophical
Transactions (vol. xli. p. 218) an 'Account of
two species of lines of the third order, not men-
tioned by Sir Isaac Newton or Mr. Stirling.'

A letter from the chevalier de Ramsay, author
of the Travels of Cyrus, in a letter to father
Castel, a jesuit at Paris, and published in the
Memoires de Trevoux, gives the following inter-
esting particulars of Mr. Stone's early life :—' True
genius overcomes all the disadvantages of birth,
fortune, and education ; of which Mr. Stone is
a rare example. Born a son of a gardener of
the duke of Argyle, he arrived at eight years of
age before he learnt to read. By chance a ser-
vant having taught young Stone the letters of
the alphabet, there needed nothing more to dis-
cover and expand his genius. He applied him-
self to study, and he arrived at the knowledge
of the most sublime geometry and analysis
without a master, without a conductor, without
any other guide than pure genius.

'At eighteen years of age he had made these
considerable advances without being known, and
without knowing himself the prodigies of his
acquisitions. The duke of Argyle, who joined
to his military talents a general knowledge of
every science that adorns the mind of a man of

his rank, walking one day in his garden, saw lying on the grass a Latin copy of Sir Isaac Newton's celebrated *Principia*. He called some one to him to take and carry it back to his library. Our young gardener told him that the book belonged to him. 'To you?' replied the duke. 'Do you understand geometry, Latin, Newton?' 'I know a little of them,' replied the young man, with an air of simplicity arising from a profound ignorance of his own knowledge and talents. The duke was surprised; and, having a taste for the sciences, he entered into conversation with the young mathematician: he asked him several questions, and was astonished at the force, the accuracy, and the candor of his answers. 'But how,' said the duke, 'came you by the knowledge of all these things?' Stone replied, 'a servant taught me, ten years since, to read: does one need to know any thing more than the twenty-four letters in order to learn every thing else that one wishes?' The duke's curiosity redoubled—he sat down upon a bank, and requested a detail of all his proceedings in becoming so learned. 'I first learned to read,' said Stone: 'the masons were then at work upon your house: I went near them one day, and I saw that the architect used a rule, compasses, and that he made calculations. I enquired what might be the meaning and use of these things; and I was informed that there was a science called arithmetic: I purchased a book of arithmetic and I learned it.—I was told there was another science called geometry: I bought the books, and I learned geometry. By reading I found that there were good books in these two sciences in Latin: I bought a Dictionary, and I learned Latin. I understood also that there were good books of the same kind in French: I bought a dictionary, and I learned French. And this, my lord, is what I have done: it seems to me that we may learn every thing when we know the twenty-four letters of the alphabet.'

'This account charmed the duke. He drew this wonderful genius out of his obscurity; and he provided him with an employment which left him plenty of time to apply himself to the sciences. He discovered in him also the same genius for music, for painting, for architecture, for all the sciences which depend on calculations and proportions. 'I have seen Mr. Stone. He is a man of great simplicity. He is at present sensible of his own knowledge: but he is not puffed up with it. He is possessed with a pure and disinterested love for the mathematics; though he is not solicitous to pass for a mathematician: vanity having no part in the great labor he sustains to excel in that science. He despises fortune also; and he has solicited me twenty times to request the duke to give him less employment, which may not be worth the half of that he now has, in order to be more retired, and less taken off from his favorite studies. He discovers sometimes, by methods of his own, truths which others have discovered before him. He is charmed to find on these occasions that he is not a first inventor, and that others have made a greater progress than he thought. Far from being a plagiarist, he attributes ingenious solutions, which he gives to certain problems, to the hints he has found in

others, although the connexion is but very distant,' &c.

STONE (Jerome), the son of a reputable seaman, was born in the parish of Scoonie, in Fife. His father died abroad when he was but three years of age, and his mother, with her young family, was left in very narrow circumstances. Jerome having got the ordinary school education, reading English, writing, and arithmetic, commenced travelling chapman. But he soon converted his stock of buckles, garters, &c., into books, and for some years went through the country, and attended the fairs as an itinerant bookseller. Formed by nature for literature, he possessed a peculiar talent for acquiring languages with amazing facility. He taught himself Hebrew and Greek, and, by the aid of Mr Turcan, the parish schoolmaster, acquired some knowledge of Latin. Some time afterwards he was encouraged to prosecute his studies at the university of St. Andrew's. An unexampled proficiency in every branch of literature recommended him to the esteem of the professors; and an uncommon fund of wit and pleasantry rendered him the favorite of all his fellow students. About this period some very humorous poetical pieces of his composition were published in the Scots Magazine. Before he had finished his third session of St. Andrew's, on an application to the college by the master of the school of Dunkeld for an usher, Mr. Stone was recommended as the best qualified for that office; and about two or three years after, the master being removed to Perth, Mr. Stone, by the favor of the duke of Atholl, who had conceived a high opinion of his abilities, was appointed his successor. Having, with his usual assiduity and success, acquired a complete knowledge of the Gaelic language, he collected a number of ancient poems, the production of Irish or Scottish bards. Some of these were translated into English verse, before Mr. Macpherson published his translations from Ossian. He died while he was writing and preparing for the press a treatise entitled, *An Enquiry into the Original of the Nation and Language of the Ancient Scots, with Conjectures about the Primitive State of the Celtic and other European Nations*. In this treatise he proves that the Scots drew their original, as well as their language, from the ancient Gauls. A fever put an end to his life, his labors, and his usefulness, in 1757, the thirtieth year of his age. He left in MS. a much esteemed and well known allegory, entitled *The Immortality of Authors*, which has been published and often reprinted since his death.

STONE (John), a celebrated English painter, in the reigns of Charles I. and II. He studied under Cross, and spent thirty-seven years abroad, where he acquired several languages, being a man of learning as well as a good painter. He died at London, August 24th, 1653.

STONE, a market-town and parish in Pirehill hundred, Stafford, seven miles north of Stafford, and 141 north-west from London, on the banks of the Trent. Besides the advantages of the river Trent, it has a canal navigation, communicating with most of the principal towns in the adjacent counties, by which its commercial in-

portance has been greatly increased. Considerable quantities of shoes are made in this town, and here is a patent roller-pump manufactory, which employs many hands. The town is chiefly formed of one tolerably good street. The church is a noble structure, with a square, but low, tower. Here is a charity and free grammar-school.

STONE, in merchandize, denotes a certain weight for weighing commodities. A stone of beef at London is eight pounds: in Herefordshire twelve pounds; in the north sixteen pounds. A stone of glass is five pounds; of wax eight pounds. A stone of wool (by stat. 11 Hen. VII.) is to weigh fourteen pounds; yet in some places it is more, in others less: as in Gloucestershire fifteen pounds; in Herefordshire twelve pounds. Among horse-courers a stone is the weight of fourteen pounds. The reason of the name is obvious. Weights at first were generally made of stone. See Deut. xxv. 13, where the word **כִּסָּא**, translated weight, signifies a stone.

STONE, PUDDING. See CALLANDER, and MINERALOGY.

STONE, ROCKING, or LOGAN, a stone of a prodigious size, so exactly poised that it would rock or shake with the smallest force. Of these stones the ancients give us some account. Pliny says that at Harpasa, a town of Asia, there was a rock of such a wonderful nature that if touched with the finger it would shake, but could not be moved from its place with the whole force of the body. Ptolemy Hephæstion mentions a gygonian stone near the ocean, which was agitated when struck by the stalk of an asphodel, but could not be removed by a great exertion of force. The word gygonius seems to be Celtic; for *gingog* signifies motans, the rocking stone. Many rocking stones are to be found in different parts of this island; some natural, others artificial, or placed in their position by human art. In the parish of St. Leven, Cornwall, there is a promontory called Castle Treyn. On the western side of the middle group, near the top, lies a very large stone, so evenly poised that any hand may move it from one side to another; yet it is so fixed on its base that no lever nor any mechanical force can remove it from its present situation. It is called the Logan stone, and is at such a height from the ground that no person can believe that it was raised to its present position by art. But there are other rocking stones, which are so shaped and so situated that there can be no doubt but they were erected by human strength. Of this kind Borlase thinks the great Quoit or Karn-lehau, in the parish of Tywidnek, to be. It is thirty-nine feet in circumference, and four feet thick at a medium, and stands on a single pedestal. There is also a remarkable stone of the same kind in the island of St. Agnes in Scilly. The under rock is ten feet six inches high, forty-seven feet round the middle, and touches the ground with no more than half its base. The upper rock rests on one point only, and is so nicely balanced that two or three men with a pole can move it. It is eight feet six inches high, and forty-seven feet in circumference. On the top there is a basin hollowed out, three feet eleven inches in diameter at a medium, but wider at the brim, and three

feet deep. From the globular shape of this upper stone it is highly probable that it was rounded by human art, and perhaps even placed on its pedestal by human strength. In Stithney parish, near Helston, in Cornwall, stood the famous logan, or rocking stone, commonly called Men Amber, q. d. men an bar, or the top-stone. It was eleven feet by six, and four high, and so nicely poised on another stone that a little child could move it, and all travellers who came this way desired to see it. But Shrubal, Cromwell's governor of Pendennis, with much ado caused it to be undermined, to the great grief of the country. There are some marks of the tool on it; and, by its quadrangular shape, it was probably dedicated to Mercury. There is a rocking stone in Perthshire, near Balvaird Castle, in the Ochil hills, on the estate of Mr. Murray of Conland. That the rocking stones are monuments erected by the Druids cannot be doubted; but tradition has not informed us for what purpose they were intended. Mr. Toland thinks that the Druids made the people believe that they alone could move them, and that by a miracle; and that by this pretended miracle they condemned or acquitted the accused, and brought criminals to confess what could not otherwise be extorted from them. How far this conjecture is right, we shall leave to those who are deeply versed in the knowledge of antiquities to determine.

STONE, SONOROUS, a kind of stone remarkable for emitting an agreeable sound when struck, and much used in China for making musical instruments, which they call *king*. The various kinds of sonorous stones known in China differ considerably from one another in beauty, and in the strength and duration of their tone; and what is very surprising is, that this difference cannot be discovered either by the different degrees of their hardness, weight, or fineness of grain, or by any other qualities which might be supposed to determine it. Some stones are found remarkably hard which are very sonorous; and others exceedingly soft which have an excellent tone; some extremely heavy emit a very sweet sound; and there are others as light as pumice stone which have also an agreeable sound. It appears that the Romans were formerly acquainted with a sonorous stone of the class of *hiang-che*. Pliny (says the abbé du Bos, in his *Reflections on Poetry and Painting*, when speaking of curious stones) observes that the stone called *chalcophonas*, or brazen sound, is black; and that, according to the etymology of its name, it sends forth a sound much resembling that of brass when it is struck. The passage of Pliny is as follows: *Chalcophonas nigra est; sed elisa æris tinnitum reddit*. Some sonorous stones were at length sent into France, and the late duke de Chauines examined them with particular attention. From the duke's observations there is reason to believe that the stones of which the king are formed are nothing else but a black kind of marble, the constituent parts of which are the same as those of the marble of Europe, but that some difference in their organisation renders them more or less sonorous.

STONE DIKE, in agriculture, is that sort of

dike or mound which is formed with stone and earth. These dikes should consist of a double face to two-thirds of their height, and the other third be of single stones, built up in an open form and manner, so as to hang firmly on each other. They are made in the Highland sheep districts, where this manner of forming them is much had recourse to, five or five feet and a half high from the surface of the ground. A dike thus built, when well executed, and filled with through-bands, bids defiance, it is said, to most kinds of animals, none of which are fond of venturing over it; whereas a green sod on the top of a double-faced wall invites the sheep to attempt clearing it, which they not unfrequently do with facility. These dikes are equally durable and cheap; even more so than the turf or sod covered or coped stone-walls, while they are greatly more effectual. They are the most proper for confining of sheep; and, on farms purely of this kind, are perhaps the best sort of contrivance for restraining them of any yet known. They have different names in different sheep districts.

STONE INDIANS, a tribe of Indians inhabiting the south of Fire Fort, or Assiniboin River, in North America. Their number is estimated by Mackenzie at 450 warriors. They have great numbers of horses, which are generally brought from the Spanish settlements in Mexico. These are employed as beasts of burden, and also in the chase of the buffalo. The former are not considered as being of much value, as they may be purchased for a gun which costs twenty guineas in Great Britain. Many of the hunters, however, cost more than ten times this price. Of these useful animals no care whatever is taken; for, when they are no longer employed, they are turned loose to provide for themselves.

STONES, MILL. In small corn-mills, where only one pair of stones is in use, they are, it is said, roughed on the surface, to enable them to tear, bruise, and reduce the grain, by the use of a small hand-pick. Stones, thus prepared and dressed, serve well for making of oatmeal, which is best and most relished when rough, and large in the grain; but they are not capable of grinding barley or peas to that fineness of flour which is necessary for some uses. It is requisite to have a separate pair of stones for this purpose, which are dressed on the surface, with a small chisel, in grooves running in from the circumference to the centre, as in the stones of wheat-mills; the edges of these grooves clip the grain like scissors, and there is no interstice through which any of the grain can escape, until it is reduced to the required fineness of meal which is proper.

STONE PICKERS are persons employed in picking stones from off the ground. In order to prevent the loss of time in filling and emptying the baskets, and that of having recourse to the team, the use of one horse and a light cart is advised, which attending seven or eight women, boys, and girls, may run over forty acres in about four days. It is advised by Mr. A. Young that constantly in a dry season an opportunity should be taken to stone-pick the grass and clover

fields intended for mowing. In this work, no stones are, he says, however, to be taken, but such as would impede the scythe. It is often the case, he adds, that the pickers, who generally like this work, will over-pick if they are not attended to, and propose to pick fields which are not to be mown; but this is on no account to be permitted, if the stones be not much wanted. It has been often remarked, and is a known fact, that too much stone-picking has done a very sensible mischief, in many cases where picked by authority of parliament for turnpike roads. And Mr. Macro, of Suffolk, ascertained it experimentally.

STONE PITCH, or rather **PITCH STONE**. See **MINERALOGY**.

STONE WARE, or **STONE-WARE**, as it is often absurdly compounded, a species of pottery so called from its hardness. See **DELFT**, **PORCELAIN**, and **POTTERY**. Clay is a principal ingredient in pottery of all kinds which has the property of hardening in the fire, and of receiving and preserving any form into which it is moulded. One kind of clay resists the most violent action of the fire after being hardened to a certain degree, but is incapable of receiving a sufficient degree of hardness and solidity. A second kind assumes a hardness resembling that of flint, and such a compactness that vessels made of it have a glossy appearance in their fracture resembling porcelain. These two species owe their peculiar properties of resisting heat without melting, to sand, chalk, gypsum, or ferruginous earth, which they contain. A third species of clay begins to harden with a moderate fire, and melts entirely with a strong fire. It is of the second species that stone ware is made. The most famous manufactory of stone ware, as well as of other kinds of pottery, is at Burslem in Staffordshire. This can be traced with certainty at least two centuries back; but of its first introduction no tradition remains. In 1686, as we learn from Dr. Plot's *Natural History of Staffordshire*, only the coarse yellow, red, black, and mottled wares, were made in this country; and the only materials employed for them appear to have been the different colored clays which are found in the neighbourhood, and which form some of the measures or strata of the coal mines. These coarse clays made the body of the ware, and the glaze was produced by powdered lead-ore, sprinkled on the pieces before firing, with the addition of a little manganese for some particular colors. The quantity of goods manufactured was at that time so inconsiderable that the chief sale of them, Plot says, was 'to poor cratemmen, who carried them on their backs all over the country.' About 1690 two ingenious artisans from Germany, of the name of Ellers, settled near Burslem, and carried on a small work for a little time. They brought into this country the method of glazing stone ware, by casting salt into the kiln while it is hot, and some other improvements of less importance; but, finding they could not get their secrets kept, they left the place rather in disgust. From this time various kinds of stone ware, glazed by the fumes of salt in the manner above mentioned, were added to the wares before made. The white kind, which afterwards became, and for many succeeding

years continued, the staple branch of pottery, is said to have owed its origin to the following accident:—A potter, Mr. Astbury, travelling to London, perceived something amiss with one of his horse's eyes. An ostler at Dunstable said he could soon cure him, and for that purpose put a common black flint stone into the fire. The potter observing it, when taken out, to be of a fine white, immediately conceived the idea of improving his ware by the addition of this material to the whitest clay he could procure: accordingly he sent home a quantity of the flint stones of that country, where they are plentiful among the chalk, and, by mixing them with tobacco-pipe clay, produced a white stone ware much superior to any that had been seen before. Some of the other potters soon discovered the source of this superiority, and did not fail to follow his example. For a long time they pounded the flint stones in private rooms by manual labor in mortars; but many of the poor workmen suffered severely from the dust of the flint getting into their lungs, and producing dreadful coughs, consumptions, and other pulmonary disorders. These disasters, and the increased demand for the flint powder, induced them to try to grind it by mills of various constructions: and this method, being found both effectual and safe, has continued in practice ever since. With these improvements, in the beginning of the eighteenth century, various articles were produced for tea and coffee equipages. Soon after attempts were made to furnish the dinner table also; and, before the middle of the century, utensils for the table were manufactured in quantity, as well for exportation as home consumption. But the salt glaze, the only one then in use for this purpose, is in its own nature so imperfect, and the potters, from an injudicious competition among themselves for cheapness rather than excellence, had been so inattentive to elegance of form and neatness of workmanship, that this ware was rejected from the tables of persons of rank; and about 1760 a white ware, much more beautiful and better glazed than ours, began to be imported in considerable quantities from France. This inundation of a foreign manufacture, so much superior to any of our own, must have had very bad effects upon the potteries of this kingdom, if a new one, still more to the public taste, had not appeared soon after. In 1763 Mr. Josiah Wedgwood, who had already introduced several improvements into this art, invented a species of earthen ware for the table quite new in its appearance, covered with a rich and brilliant glaze, bearing sudden alternations of heat and cold, manufactured with ease and expedition, and consequently cheap, and having every requisite for the purpose intended. To this new manufacture the queen was pleased to give her name and patronage, commanding it to be called Queen's ware, and honoring the inventor by appointing him her majesty's potter. The common clay of the country is used for the ordinary sorts; the finer kinds are made of clay from Devonshire and Dorsetshire, chiefly from Biddeford; but the flints from the Thames are all brought rough by sea, either to Liverpool or Hull, and and so by Burton. There is no conjecture formed

of the original reason of fixing the manufacture in this spot, except for the convenience of plenty of coal, which abounds under all the country.

STONES, *mode of moving*, under this head it may be advisable to point out the mode of employing the largest and most massive which has been conveyed from its earth-bound bed. We allude to the base of the statue erected to the memory of the emperor Peter, at St. Petersburg. It is represented in our Plate as it was removed by a series of friction balls, and motion communicated by the agency of pulleys, giving a mechanical advantage of sixteen to one pound of power employed. When the stone reached the sea-side, it was suspended between two large vessels which had been cut down for the occasion.

STONES, in the old system of mineralogy, were defined bodies which are insipid, not ductile nor inflammable, nor soluble in water. But as this is the definition given of earths, by chemists and naturalists, we must refer the reader to the article MINERALOGY, for a view of the classification of stones. Here we will only make a few observations concerning their natural history.

Some philosophers say that stones are vegetables; that they grow and increase in size like a plant. This theory, we believe, was first offered to the world by M. Tournefort, in 1702, after returning from his travels in the east. It was founded on a curious fact. In surveying the labyrinth of Crete he observed that the names which visitors had engraved upon the rock were not formed of hollow but of prominent letters, like basso relievos. He supposes that these letters were at first hollowed out by knives; that the hollows have since been filled up by the growth of the stone; and hence he concludes that stones vegetate. Allowing the supposition to be true that they were at first hollow, we reply it is only a single fact, and that it is altogether unphilosophical to deduce a general system from a single fact. But this protuberancy of the characters is very improperly called vegetation; for it is not produced by a process in any respect like vegetation. Vegetation supposes vessels containing fluids and growth by expansion; but who ever heard of vessels in a stone, of fluids moving in them, or of the different parts expanding and swelling like the branch or trunk of a tree? Even the fact which Tournefort mentions proves nothing. He does not pretend to say that the rock itself is increasing, but only that a few small hollows are filled with new stony matter, which rises a little above the surrounding surface of the rock. This matter evidently has been once liquid, and at length has congealed in the channel into which it had run. But is not this easily explained by a common process, the formation of stalactites? When water charged with calcareous matter is exposed to the action of air, the water evaporates, and leaves the calcareous earth behind, which hardens and becomes like a stone. Having thus examined the principal fact upon which M. Tournefort founds his theory, it is unnecessary to follow him through the rest of his subject. Upon the whole we conclude that no such theory as this, that stones are vegetables, can be drawn from the supposed fact respecting the labyrinth.

STONES, in mythology, were objects of religious worship among the ancients. They were unshaped shapeless masses, called by Sanchoniathon *Bætilia*. See *BÆTYLOS*. Pausanias speaks of the statues of Hercules and of Cupid as merely such masses of stone. He adds that there were seen, even in one place, thirty square stones, which had the names of so many divinities.

STONEHAVEN, or STONEHIVE, a sea-port town in Kincardineshire, in the parish of Dundottar, Scotland, situate on the coast where the Cowie and Carron unite their waters as they flow into the sea; about fifteen miles south by west of Aberdeen, and twenty-two north by east of Montrose. It is composed of an old and new town, the former lying on the south bank of the Carron, adjacent to the harbour, and consisting of two considerable streets; the other on a peninsula formed by the Carron and Cowie. This last is laid out upon a regular plan, having broad streets and a square in the centre. The harbour is a natural basin, sheltered on the south-east by a high rock which runs out into the sea, and on the north-east by a quay, very convenient for unloading goods, but is neither very capacious nor safe. It derives its principal support from the sheriff's-court of the county, which has its seat here. Of late the brown linen manufacture has been introduced, and the commerce of the place is rapidly increasing. Stonehaven is a burgh of barony, of which the jurisdiction is by charter vested in magistrates.

STONEHENGE, a celebrated monument of antiquity, stands in the middle of a flat area near the summit of a hill six miles from Salisbury. It is enclosed by a circular double bank and ditch nearly thirty feet broad, after crossing which we ascend thirty yards before we reach the work. The whole fabric consisted of two circles and two ovals. The outer circle is about 108 feet diameter, consisting when entire of sixty stones, thirty uprights and thirty imposts, of which remain only twenty-four uprights, seventeen standing and seven down, three feet and a half asunder, and eight imposts. Eleven uprights have their five imposts on them by the grand entrance. These stones are from thirteen to twenty feet high. The lesser circle is somewhat more than eight feet from the inside of the outer one, and consisted of forty lesser stones (the highest six feet), of which only nineteen remain, and only eleven standing; the walk between these two circles is 300 feet in circumference. The *Adytum* or Cell is an oval formed of ten stones (from sixteen to twenty-two feet high,) in pairs, with imposts, which Dr. Stukeley calls *trilithons*, and above thirty feet high, rising in height as they go round, and each pair separate, and not connected as the outer pair; the highest eight feet. Within these are nineteen more smaller single stones, of which only six are standing. Three of the five *trilithons* at the west end fell flat westward, levelling also in their descent a stone of the second circle that stood in the line of their precipitation, on the third of January 1797. At the upper end of the *Adytum* is the altar, a large slab of blue coarse marble, twenty inches thick, sixteen feet long, and four broad; pressed down by the weight of the vast stones that have

fallen upon it. The whole number of stones, uprights, imposts, and altar, is exactly 140. The stones are far from being artificial, but were most probably brought from those called the grey weathers on Marlborough Downs fifteen or sixteen miles off; and if tried with a tool they appear of the same hardness, grain, and color, generally reddish. The heads of oxen, deer, and other beasts, have been found on digging in and about Stonehenge; and human bones in the circumjacent barrows. There are three entrances from the plain to this structure, the most considerable of which is from the north-east, and at each of them were raised on the outside of the trench two huge stones with two smaller within parallel to them. It has been long a dispute among the learned, by what nation, and for what purpose, these enormous stones were collected and arranged. The first account of this structure we meet with is in Geoffroy of Monmouth; who in the reign of King Stephen, wrote the history of the Britons in Latin. He tells us that it was erected by the counsel of Merlin the British enchanter, at the command of Aurelius Ambrosius the British king, in memory of 460 Britons who were murdered by Hengist the Saxon. The next account is that of Polydore Virgil, who says that the Britons erected this as a sepulchral monument of Aurelius Ambrosius. Others suppose it to have been a sepulchral monument of Boadicea the famous British queen. Inigo Jones is of opinion that it was a Roman temple; from a stone sixteen feet long, and four broad, placed in an exact position to the east altar-fashion. Mr. Charlton attributed it to the Danes, who were two years masters of Wiltshire; a tin tablet, on which were some unknown characters, supposed to be Punic, was dug up near it in the reign of Henry VIII. but is lost. Its common name, Stonehenge, is Saxon, and signifies a stone gallows, to which those stones, having transverse imposts, bear some resemblance. It is also called in Welsh *choir gour*, or the giant's dance. Mr. Grose thinks that Dr. Stukeley has completely proved this structure to have been a British temple in which the Druids officiated. He supposes it to have been the metropolitan temple of Great Britain, and translates the words *choir gour*, the great choir or temple. Mr. Bryant is of opinion that it was erected by a colony of *Cuthites* probably before the time of the Druids; because it was usual with them to place one vast stone upon another for a religious memorial; and these they often placed so equally that a breath of wind would sometimes make them vibrate. Of such stones one remains in the pile of Stonehenge. The ancients distinguished stones erected with a religious view, by the name of *amber*; by which was signified any thing solar and divine. The Grecians called them *πετραι αμβροσιαι*, *petrae ambrosiæ*. Stonehenge, according to Mr. Bryant, is composed of these *amber stones*: hence the next town is denominated *Ambresbury*; not from a Roman *Ambrosius*, but from the *ambrosiæ petrae*, in whose vicinity it stood. Some of these were *rocking stones*; and there was a wonderful monument of this sort near Penzance in Cornwall, which still retains the name of *main-amber*, or the *sacred stones*. Such a one is mentioned by

Appollonius Rhodius, supposed to have been raised in the time of the Argonauts, in the island Tenos, as the monument of the two-winged sons of Boreas, slain by Hercules; and there are others in China and other countries.

Sir R. C. Hoare, in 1812, observes: 'It is a melancholy consideration that at a period when the sciences are progressively advancing, and when newly discovered manuscripts are continually drawn forth from their cloistered retreats to throw a light on the ancient records of our country, it is mortifying, I say, that the history of so celebrated a monument as Stonehenge should still remain veiled in obscurity. The monks may boldly assert that Merlin and only Merlin was the founder of our temple; and we cannot contradict, though we may disbelieve. The revolution of ages frequently illustrates history, and brings many important facts to light; but here all is darkness and uncertainty; we may admire, we may conjecture; but we are doomed to remain in ignorance and obscurity.'

Mr. Davies, the learned author of *Celtic Researches*, and of the *Mythology*, &c., of the British Druids, enters more profoundly, perhaps, than any other author into the question in the latter work respecting the origin and appropriation of Stonehenge. He supposes that this structure, and Silbury-hill, are two of the three works alluded to in a Welsh Triad, as constituting the greatest labors of the island of Britain, i. e. lifting the stone of Ketti; building the work of Emrys; and piling the mount of the assemblies. That Stonehenge is really a Druidical structure, the same learned writer farther remarks, 'is evident from the language in which it was described, and the great veneration in which it was held by the primitive bards, those immediate descendants and avowed disciples of the British Druids. As the great sanctuary of the dominion, or metropolitan temple of our heathen ancestors, so complex in its plan, and constructed upon such a multitude of astronomical calculations, we find it was not exclusively dedicated to the sun, the moon, saturn, or any other individual object of superstition; but it was a kind of Pantheon, in which all the Arkite and Sabian divinities of British theology were supposed to have been present; for we perceive Noe and Hu, the deified patriarch; Elphin and Rheiddin, the sun; Eseye, Isis; Ked, Ceres, with the cell of her sacred fire; Llywy, Proserpine; Gwydien, Hermes; Budd, Victory; and several others.' As to the precise date of Stonehenge, Mr. Davies offers nothing definitive; but remarks that it was most likely of later origin than the introduction of the Heli-Arkite superstition, which is traditionally said to have been of foreign origin, and to have come into England by the way of Cornwall, and, therefore, probably from the tin merchants. He also remarks 'that it was a monument of venerable antiquity in the days of Hengist, and that its peculiar sanctity influenced the selection of the spot for the place of conference between the British and Saxon princes,' p. 385, &c. Mr. Davies farther mentions a passage in the Greek historian Diodorus Siculus, describing a round temple dedicated to Apollo, and concludes this to have been most likely our

monument of Stonehenge. The substance of the Grecian author is: 'Among the writers of antiquity, Hecateus and some others relate that there is an island in the ocean, opposite to Celtic Gaul, and not inferior in size to Sicily, lying towards the north, and inhabited by Hyperborei, who are so called because they live more remote from the north wind. The soil is excellent and fertile; and the harvest is made twice in the same year. Tradition says that Latona was born here, and therefore Apollo is worshipped above any other deity; to him is also dedicated a remarkable temple of a round form, &c.'

Mr. Cunnington, in his *History of Ancient Wiltshire*, fol. 1812, grounds a new supposition on the difference in quality and size between the stones of the great circle and interior row, and those of the smaller ones: and hence supposes that Stonehenge was erected at different periods. He also supposes that the larger stones, with their imposts, constituted the old, or original work; and that the small stones of the second circle, and those of the inner range, were raised at a later period, as 'they add nothing to the grandeur of the temple.' To exemplify this opinion, Sir Richard Hoare has given a bird's-eye view of the structure, thus divested of the smaller stones. Unfortunately for the theorist, this system is not warranted by any example among the numerous Druidical circles of Great Britain; but, on the contrary, it will be more consistent with these, and with the practices of remote ages, to conclude that the second circle of small, rough, unhewn stones, with another circle immediately within the ditch, and some other members, now destroyed, formed the original, pristine temple.

'It may be naturally expected,' says Sir Richard Hoare, in his *Ancient Wiltshire*, 'that, after quoting the various descriptions of others respecting Stonehenge, I should give some opinions of my own. This I shall do with diffidence, and lament that the history of this celebrated 'wonder of the west' will most probably ever remain unknown. I cannot for a moment hesitate in declaring it to be neither Roman, Saxon, nor Danish. We learn from the Holy Scriptures that the earliest memorials were of stone; and we find to this day single, double, and triple upright stones, as well as numerous circles dispersed about our dominions: we then find some attempts at architecture in the cromlech and kistvaen, in both of which we see immense stones laid incumbent upon others that are upright: whether these gave the idea of the imposts at Stonehenge, or vice versa, will be a difficult matter to determine; at all events, I consider Stonehenge of a much more modern date than Abury, where there are no imposts, and no marks of working on the stones; but in the former we perceive a regular plan, a great deal of symmetry and great knowledge in mathematics. We know, also, that many stone monuments exist on the continent, and in that part of it whence our island probably received its earliest population, viz. Gallia-Celtica. The most remarkable of these monuments, and such as must excite curiosity in the highest degree, is situated in the hamlet of Carnac, near Vannes and Auray, on

the western coast of Bretagne, and in the department of Morbihan, in France. M. Cambray, in his *Monumens Celtiques*, has given a very detailed and animated description of this interesting relic of antiquity. He tells us that some detached stones on the hills and sand-banks announce the approach to this grand theatre, which consists of an immense number of rude unhewn stones (amounting to four thousand, or more), standing in an upright position, on a sandy plain, near the sea-coast. They are ranged in eleven straight lines, which lines are separated from each other by a space of thirty or thirty-three feet, and the distance from one stone to another varies from twelve to fifteen feet. The highest of these stones measures twenty-two feet out of the ground; the width varies; one of them is twenty-two feet high, twelve feet wide, and six feet thick; and many of them are moveable: these stones present the most singular aspect; they stand alone on an extensive plain, attended only by the sand that supports them, and the vault of heaven that surrounds them; not an inscription to explain, nor an analogy to inform; the men whom you call, the traveller whom you interrogate, gaze at it, and either turn away their head, or recount follies. They recall to our memory those times which neither our calculation nor our history can ever attain. I have before stated my opinion, that our earliest inhabitants were Celts, who naturally introduced with them their own buildings, customs, rites, and religious ceremonies; and to them I attribute the erection of Stonehenge, and the greater part of the sepulchral memorials that still continue to render its environs so truly interesting to the antiquary and historian.

The general title of Druidical has been given to all these stone monuments, and some of my readers may be surprised that I have not adopted it. That the Druids existed in our island at a very early period, and officiated as priests, there can be no doubt; but, as the learned Mr. Bryant, in his *Mythology*, observes, 'under the sanction of their names, we shelter ourselves whenever we are ignorant and bewildered.' And Mr. Borlase, with equal justness, remarks 'that the work of Stonehenge must have been that of a great and powerful nation, not of a limited community of priests; the grandeur of the design, the distance of the materials, the tediousness with which all such massive works are necessarily attended, all show that such designs were the fruits of peace and religion.' We are ourselves much inclined to think, with an able writer in the *Edinburgh Review* of 1806, that these Druidical temples, and especially this of Stonehenge, served the purpose (perhaps additionally to that of places of worship) of rude observatories.

STONEHOUSE (Sir James), a pious English physician and divine, born in Berkshire, in 1715. He was educated at St. John's College, Oxford, where he took his degree of M. D., and afterwards settled at Northampton. There he became intimate with Dr. Doddridge, Mr. Hervey, and other eminent divines. About 1762 he entered into orders, and was appointed lecturer of All-Saints, Bristol, and minister of Great and Little Cheve-

rel, Wilts. He succeeded to the family title and estate in 1792; but died in 1795, aged eighty. He was admired as a man and a preacher. He published *Friendly Advice to a Patient*, and other religious tracts.

STONEPLOVER, or STONE CURLEW. See CHARADRIUS.

STONY POINT, a post on the right bank of the Hudson, in the state of New York. In 1779 it was taken by the British, but recovered soon after by the Americans; and the whole garrison, consisting of 600 men, with their commanding officer, lieutenant-colonel Johnson, made prisoners of war.

STONYKIRK, or STEPHEN-KIRK, a parish in Wigton-shire, composed of the united parishes of Stonykirk, Clashank, and Toscarton, on the west coast of the bay of Luce, six miles from Port-Patrick. Within this parish are four mills for dressing flax, and an extensive bleach-field. Here is a considerable fishery for cod, salmon, and mackarel. Here is also a chalybeate spring; and in a cave, near the bay Float, called the Good Wife's Cave, is a very remarkable echo.

STOOD. The *pret.* of TO STAND, which see.

Adam, at the news,
Heart-struck with chilling gripe of sorrow stood.

Milton.

STOOL, *n. s.* } Sax. *ƿrool*; Goth. *stol*;
STOOLBALL, *n. s.* } Belg. *stoel*; Teut. *stuhl*. A low seat without a back: evacuations by purgatives: for the stool of repentance, see below: stoolballs is a game.

Thou fearful fool,
Why takest not of the same fruit of gold?
Ne sittest down on that same silver stool,
To rest thy weary person in the shadow cold?

Spenser.

There be medicines that move stools, and not urine, some other urine, and not stools: those that purge by stool are such as enter not at all, or little, into the mesentery veins; but either at the first are not digestible by the stomach, and therefore move immediately downwards to the guts, or else are afterwards rejected by the mesentery veins, and so turn likewise downwards to the guts. *Bacon's Natural History*.

Unequal and unreasonable judgments of things brings many a great man to the stool of repentance.

L' Etranger.

Now which were wise, and which were fools?
Poor Alma sits between two stools;
The more she reads, the more perplexed.

Prior.

While Betty dances on the green,
And Susan is at stoolball seen.

Id.

The peristaltick motion, or repeated changes of contraction and dilatation, is not in the lower guts, else one would have a continual need of going to stool.

Arbutnot on Aliments.

If a chair be defined a seat for a single person, with a back belonging to it, then a stool is a seat for a single person without a back.

Watts's Logic.

STOOL OF REPENTANCE, or cutty stool, in the kirks of Scotland, is somewhat analogous to the pillory. It is elevated above the congregation. In some places there may be a seat in it; but it is generally without, and the person stands therein who has been guilty of fornication, for three Sundays, in the forenoon; and, after sermon, is called upon by name and surname, the beadle or kirk-officer, bringing the offender, if refractory, forwards to his post; and then the preacher

proceeds to admonition. Here too are set to public view adulterers; only these are habited in a coarse canvas, analogous to a hairy or monastic vest, with a hood to it, which they call sack, or sackcloth, and that every Sunday throughout a year, or longer.

STOOL, in mining, is used when the miners leave off digging deeper, and work in the ends forward. The end before them is called the stool.

STOOL, in ship-building, the name of the supporters of the poop and top lanterns.

STOOP, *v. n. & n. s.* } Sax. *þrupian*; Swed. }
STOOP'INGLY, *adv.* } *stupa*; Belg. *stuypen*.
To bend down; bend forward; lout; yield; submit: the act of stooping; degradation: and (Sax. *þroppa*) a vessel of liquor: the adverb corresponds.

They, whose authority is required unto the satisfying of your demand, do think it both dangerous to admit such concourse of divided minds; and unmeet that their laws, which, being once solemnly established, are to exact obedience of all men, and to constrain thereunto, should so far stoop as to hold themselves in suspense from taking any effect upon you, till some disputer can persuade you to be obedient. *Hooker.*

Come, lieutenant, I have a stoop of wine; and here without are a brace of gallants that would fain have a measure to the health of Othello. *Shakespeare.*

I am the son of Henry the Fifth,
Who made the dauphin and the French to stoop. *Id.*

Like unto the boughs of this tree, he bended downward, and stooped towards the earth. *Raleigh.*

Where men of great wealth stoop to husbandry, it multiplieth riches exceedingly. *Bacon.*

Nani was noted to tread softly, to walk stoopingly, and raise himself from benches with laborious gesture. *Wotton.*

There is nothing more in me, Sir, but may be squeezed out without racking, only a stoop or two of wine. *Denham.*

Cow'ring low.
With blandishment, each bird stooped on his wing. *Milton.*

Death, his death-wound shall then receive,
And stoop inglorious. *Id.*

Satan ready now
To stoop with wearied wings and willing feet,
On the bare outside of this world. *Id.*

Now will I wander through the air,
Mount, make a stoop at every fair. *Waller.*

He that condescended so far, and stooped so low,
to invite and to bring us to heaven, will not refuse us a gracious reception there. *Boyle's Seraphick Love.*

When Pelopidas and Ismenias were sent to Artaxerxes, Pelopidas did nothing unworthy; but Ismenias let fall his ring to the ground, and, stooping for that, was thought to make his adoration. *Stillingfleet.*

Can any loyal subject see
With patience such a stoop from sovereignty?
An ocean poured upon a narrow brook? *Dryden.*

Mighty in her ships stood Carthage long,
And swept the riches of the world from far;
Yet stooped to Rome, less wealthy, but more strong. *Id.*

Twelve swans behold in beauteous order move,
And stoop with closing pinions from above. *Id.*

An eagle made a stoop at him in the middle of his exaltation, and carried him away. *L'Estrange.*

A caldron of fat beef, and stoop of ale,
On the huzzaing mob shall more prevail,
Than if you give them with the nicest art,
Ragousts of peacocks' brains, or filbert tart. *King.*

These are arts, my prince,
In which your Zama does not stoop to Rome. *Addison.*

STOOPING, in falconry, is when a hawk, being upon her wings at the height of her pitch, bends down violently to take the fowl.

STOP, *v. a., v. n., & n. s.* } French *estouper*;
STOP'COCK, *n. s.* } Italian *stoppare*;
STOP'PAGE, } Belg. *stoppen*; Dan-
STOP'PLE. } ish *stoppe*. To hinder; interrupt; suspend; repress; suppress; close; encumber; regulate musical strings by the finger: as a verb neuter, to cease progress: as a noun substantive, cessation; hindrance; repression; obstacle; impediment; a point in typography; an instrument to regulate musical sounds; act of applying such stops: a stop-cock is a pipe supplied with a cock: stoppage, the act of stopping: stopple is the stop of a bottle or hole.

Smite every fenced city, stop all wells of water, and mar land with stones. *2 Kings, iii. 19.*

They pulled away the shoulder, and stopped their ears, that they should not hear. *Zech. vii. 11.*

As the truth of Christ is in me, no man shall stop me of this boasting. *2 Cor. xi. 10.*

Encroachments are made by degrees from one step to another; and the best time to stop is at the beginning. *Lesley.*

The proud Duessa, full of wrathful spirit
And fierce disdain to be affronted so,
Inforced her purple beast with all her might,
That stop out of the way to overthrow. *Spenser.*

In weak and tender minds, we little know what misery this strict opinion would breed, besides the stops it would make in the whole course of all men's lives and actions. *Hooker.*

You would play upon me, you would seem to know my stops; you would pluck out the heart of my mystery. *Shakespeare.*

Blest are those,
Whose blood and judgment are so well commingled
That they are not a pipe for fortune's finger
To sound what stop she please. *Id. Hamlet.*

Thought's the slave of time, and life time's fool;
And time, that makes survey of all the world,
Must have a stop. *Shakespeare.*

Friend, 'tis the duke's pleasure,
Whose disposition all the world well knows
Will not be rubbed nor stopped. *Id. King Lear.*

Some strange commotion
Is in his brain; he bites his lip, and starts;
Stops on a sudden, looks upon the ground,
Then lays his finger on his temple; straight
Springs out into fast gait, then stops again. *Id. Henry VIII.*

Look you to the guard to-night;
Let's teach ourselves that honourable stop,
Not to outport discretion. *Shakespeare.*

The further a string is strained, the less a superstraining goeth to a note; for it requireth good winding of a string before it will make any note at all: and in the stops of lutes, the higher they go, the less distance is between the frets. *Bacon.*

In instruments of strings, if you stop a string high, whereby it hath less scope to tremble, the sound is more treble, but yet more dead.

His majesty *stopped* a leak that did much harm.

Bacon.

Stoppings and suffocations are dangerous in the body. *Id.*

Bottles swung, or carried in a wheel-barrow upon rough ground, fill not full, but leave some air; for, if the liquor come close to the *stopple*, it cannot flower. *Id.*

They first raised an army with this design, to stop my mouth, or force my consent. *King Charles.*

Even the iron-pointed pen,

That notes the tragick dooms of men,

Wet with tears stilled from the eyes

Of the flinty destinies,

Would have learned a softer style,

And have been ashamed to spoil

His life's sweet story by the haste

Of a cruel *stop* ill-placed. *Crashow.*

On indeed they went: but O! not far;

A fatal *stop* traversed their head-long course. *Daniel.*

Th' organ-sound a time survives the *stop*,
Before it doth the dying note give up. *Id. Civil War.*

The marigold, whose courtier's face
Echoes the sun, and doth unlance
Her at his rise, at his full *stop*
Packs and shuts up her gaudy shop. *Cleveland.*
Mountains of ice that *stop* th' imagined way. *Milton.*

The harp

Had work, and rested not; the solemn pipe,
And dulcimer, all organs of sweet *stop*. *Id.*

These gates are not sufficient for the communication between the walled city and its suburbs, as daily appears by the *stops* and embarrases of coaches near both these gates. *Graunt.*

If they should open a war, they foresee the consumption France must fall into by the *stop* of their wine and salts, wholly taken off by our two nations. *Temple.*

My praise the Fabii claim,

And thou, great hero, greatest of thy name,

Ordained in war to save the sinking state,

And, by delays to put a *stop* to fate. *Dryden's Æneid.*

Almon falls,

Pierced with an arrow from the distant war:
Fixed in his throat the flying weapon stood,
And *stopped* his breath, and drank his vital blood. *Dryden.*

A lion, ranging for his prey, made a *stop* on a sudden at a hideous yelling noise which startled him. *L'Estrange.*

Brokers hinder trade, by making the circuit which the money goes larger, and in that circuit more *stops*, so that the returns must necessarily be slower and scantier. *Locke.*

When men pursue their thoughts of space, they *stop* at the confines of body, as if space were there at an end. *Id.*

There were no shuts or *stopples* made for the ears, that any loud or sharp noise might awaken it, as also a soft and gentle murmur provoke it to sleep. *Ray on the Creation.*

No man could spit from him without it, but would drivel like some paralytick or fool; the tongue being as a *stopcock* to the air, till upon its removal the spittle is driven away. *Grew's Cosmologia.*

Every bold sinner, when about to engage in the commission of any known sin, should arrest his confidence, and *stop* the execution of his purpose with this question: Do I believe that God has denounced death to such a practice, or do I not? *South.*

Blessed be that God, who cast rubs, *stops*, and

hindrances in my way, when I was attempting the commission of such a sin. *Id.*

A variety of strings may be observed on their harps, and of *stops* on their tibiae; which shews the little foundation that such writers have gone upon, who, from a short passage in a classic author, have determined the precise shape of the ancient musical instruments, with the exact number of their pipes, strings, and *stops*. *Addison on Italy.*

Female zeal, though proceeding from so good a principle, if we may believe the French historians, often put a *stop* to the proceedings of their kings, which might have ended in a reformation. *Addison.*

Occult qualities put a *stop* to the improvement of natural philosophy, and therefore have been rejected. *Newton's Opticks.*

So melancholy a prospect should inspire us with zeal to oppose some *stop* to the rising torrent, and check this overflowing of ungodliness. *Rogers.*

If the rude throng pour on with furious pace,
And hap to break thee from a friend's embrace,
Stop short, nor struggle through. *Gay.*

The *stoppage* of a cough or spitting increases phlegm in the stomach. *Floyer on the Humours.*

Celsus gives a precept about bleeding, that when the blood is good, which is to be judged by the colour, that immediately the vein should be *stopped*. *Arbuthnot.*

The effects are a *stoppage* of circulation by too great a weight upon the heart, and suffocation. *Id.*

STOPPERS, in a ship, certain short pieces of rope, which are usually knotted at one or both ends, according to the purpose for which they are designed. They are either used to suspend any heavy body, or to retain a cable shroud, &c., in a fixed position. Thus the anchors, when first hoisted up from the ground, are hung to the cat-head by a stopper attached to the latter, which, passing through the anchor ring, is afterwards fastened to the timber head; and the same rope serves to fasten it on the bow at sea; or to suspend it by the ring which is to be sunk from the ship to the bottom. The stoppers of the cable have a large knot and a laniard at one end, and are fastened to a ring-bolt in the deck by the other. They are attached to the cable by the laniard, which is fastened securely round both by several turns passed behind the knot, or about the neck of the stopper; by which means the cable is restrained from running out of the ship when she rides at anchor. The stoppers of the shroud have a knot and a laniard at each end. They are only used when the shrouds are cut asunder in battle, or disabled by tempestuous weather; at which time they are lashed, in the same manner as those of the cables, to the separated part of the shroud, which are thereby reunited, so as to be fit for immediate service. This, however, is only a temporary expedient.

STORACE (Stephano), an eminent composer of dramatic music, was the son of an Italian performer on the bass viol, long settled in London where he was born in 1763. Early displaying strong musical talent, he was sent by his father to Italy, that he might enjoy every opportunity of cultivation, and his progress was so rapid that at the very commencement of his career he produced his celebrated finale to the first act of the Pirates, and some of his very best compositions. On his return to England he resided at Bath, till the friendship of Mr. Michael Kelly pro-

cured him the appointment of composer to Drury Lane theatre. Here he remained, with daily increasing reputation, till a violent attack of gout in the head carried him off, in 1796, in the flower of his age. His compositions are remarkable for their spirit, and his melodies have not often been excelled. His productions are the music to The Doctor and Apothecary, a farce, 1788; Haunted Tower, opera, 1789; No Song no Supper, farce, 1790; Siege of Belgrade, opera, 1791; Cave of Trophonius, musical interlude, 1791; Pirates, and Dido, operas, 1792; Prize, and Glorious First of June, musical entertainments; Cherokee, and Lodoiska, operas, 1794; Three and the Deuce, comic drama, 1795; My Grandmother, farce; Iron Chest, musical play; and Mahmoud, an opera, 1796.

STORAGE, (Anna Selina), sister to the above, an excellent comic actress and accomplished singer, was a pupil of Sacchini; and after singing at Florence, Vienna, &c., from 1780 to 1787, with reputation, came to London, and soon rose to be a favorite in her profession, a station which she maintained till her decease in the neighbourhood of London in 1814.

STORAX, LIQUID. See LIQUIDAMBAR. Liquid storax is a resinous juice obtained from a tree called Liquidambar Straciflua, a native of Virginia and Mexico, lately naturalised in Britain. The juice called liquidambar exudes from incisions made in the trunk, and the liquid storax is obtained by boiling the bark or branches in water. Two sorts of liquid storax are distinguished by authors; one the purer part of the resinous matter that rises to the surface in boiling, separated by a strainer, of the consistence of honey, tenacious like turpentine, of a reddish or ash brown color, moderately transparent, of an acrid unctuous taste, and a fragrant smell, faintly resembling that of the solid storax, but somewhat disagreeable; the other the more impure part, which remains on the strainer, is not transparent, in smell and taste is much weaker, and contains a considerable proportion of the substance of the bark. What is most commonly met with under this name in the shops is of a weak smell and a gray color, and is supposed to be an artificial composition. Liquid storax has been employed chiefly in external applications, but it is at present almost wholly in disuse.

STORAXTREE, *n. s.* Lat. *styrax*. A plant; a resinous and odoriferous gum.

I yielded a pleasant odour like the best myrrh, as galbanum, and sweet storax. *Eccclus* xxiv. 15.

STORE, *n. s., v. a., & adj.* } Goth. Swed. Dan. STOREHOUSE. } and Sax. *stor*, all signify large, great. The Teutonic dialects nearer to English seem not to have retained this word. Large number; large quantity; plenty; a stock accumulated; hoard; magazine: to furnish; replenish; stock; lay up; hoard: Bacon uses it for hoarded; laid up: a store-house is a magazine; granary; depository; a great mass reposit.

Joseph opened all the storehouses, and sold unto the Egyptians. *Genesis* xli. 56.

Is not this laid up in store with me, and sealed up among my treasures? *Deuteronomy* xxxii. 34.

They greatly joyed merry tales to feign,
Of which a storehouse did with-her remain.

Fuerie Quene.

Some were of opinion that it were best to stay where they were, until more aid and store of victuals were come; but others said the enemy were but barely stored with victuals, and therefore could not long hold out.

Knolles's History.

By us it is willingly confessed that the scripture of God is a storehouse abounding with inestimable treasures of wisdom and knowledge, in many kinds over and above things in this kind barely necessary.

Hooker.

Suffer us to famish, and their storehouses crammed with grain!

Shakspeare. Coriolanus.

The ships are fraught with store of victuals, and good quantity of treasure.

Bacon.

What floods of treasure have flowed into Europe by that action, so that the cause of Christendom is raised since twenty times told: of this treasure the gold was accumulate and store treasure; but the silver is still growing.

Id. Holy War.

Let the main part of the corn be a common stock, laid in and stored up, and then delivered out in proportion.

Bacon.

To these high powers a storehouse doth pertain,
Where they all arts and general reasons lay;

Which in the soul, even after death, remain,
And no Lethæan flood can wash away.

Davies.

Wise Plato said the world with men was stored,
That succour each to other might afford.

Denham.

None yet, but store hereafter from the earth
Up hither like aerial vapours flew,
Of all things transitory and vain, when sin
With vanity had filled the works of men.

Milton.

Sulphurous and nitrous foam,
Concocted and adjusted, they reduced
To blackest grain, and into store conveyed.

Id.

My heart hath been a storehouse long of things
And sayings laid up, portending strange events.

Id.

One having stored a pond of four acres with carps,
tench, and other fish, and only put in two small pikes, at seven years' end, upon the draught, not one fish was left, but the two pikes grown to an excessive bigness.

Hdæ.

As many different sounds as can be made by single articulations, so many letters there are in the storehouse of nature.

Holder.

Jove, grant me length of life, and years good
store

Heap on my bended back. *Dryden's Juvenal.*

We lived supine amidst our flowing store,
We slept securely, and we dreamt of more.

Dryden.

The mind reflects on its own operations about the ideas got by sensation, and thereby stores itself with a new set of ideas, which I call ideas of reflection.

Locke.

The image of God was resplendant in man's practical understanding, that storehouse of the soul, in which are treasured up the rules of action and the seeds of morality.

South.

Thee, goddess, thee, Britannia's isle adores;
How has she oft exhausted all her stores!
How oft in fields of death thy presence sought,
Nor thinks the mighty prize too dearly bought!

Addison.

Her face with thousand beauties blest;
Her mind with thousand virtues stored;
Her power with boundless joy confest,
Her person only not adored.

Prior.

To store the vessel let the care be mine
With water from the rocks, and rosy wine,
And life-sustaining bread.

Pope's Odyssey.

STOREKEEPER, a person entrusted with the care of the stores in the magazines, such as the provisions, forage, &c. During a war, storekeepers receive these articles from contractors, and deliver them out to the troops. They have several clerks under them, appointed to different departments of provisions, hay, straw, oats, &c. The storekeepers belonging to the ordnance have charge of all the king's stores, belonging both to land and sea-service. The government storekeeper-general is an appointment of recent date, which has been given to John Trotter, esq.

STORESHIP. See **SHIP**.

STORES, MILITARY, are provisions, forage, arms, clothing, ammunition, &c. Officers, storekeepers, or commissaries, who are convicted of embezzling or misapplying any military stores, are to make good the damage, forfeit £100, and be cashiered. See *Mutiny Act*, sect. 65.

STORES, MEDICAL, on board transports. Certain articles of diet, which are put on board each transport, are so called. These are to be considered as intended solely for the use of the sick, or convalescent; they are to remain in the charge of the master of the transport, and only to be issued upon demand in writing, made by the surgeon from time to time, as he shall judge proper; or, when there is no surgeon, upon demand of the commanding officer. And the surgeon or commanding officer is to give the master, at the end of the voyage, a certificate that his demands for the said medical stores have been made only upon proper occasions, and have not been expended for any other use than that of the sick or convalescent.

STORK, *n. s.* Sax. *storc*; Belg. *stork*; Gr. *στορν*. A bird of passage, famous for the regularity of its departure.

STORK, in ornithology. See **ARDEA**.

STORK (Abraham), a celebrated Dutch painter, famed for sea-pieces and sea-ports. In these his figures were small; but so numerous, varied, and accurate, as to afford a great fund of entertainment. He died in 1708. His brother was a landscape painter, but not equal to Abraham.

STORM, *n. s. & v. n.* } Welsh, *ystorm*; Sax. *Storm*, *adj.* } *storum*; Goth. Swed. Dan. and Belg. *storm*; Ital. *stormo*. A tempest; a commotion of the elements; hence any violent assault, commotion, or calamity; to storm is, to attack by open force; to raise a tempest; to rage; fume: stormy is, tempestuous; violent; passionate.

O turn thy rudder hitherward a while,
Here may thy storm-beat vessel safely ride. *Spenser*.

So now he storms with many a sturdy stoure,
So now his blustering blast each coast doth scour. *Id.*

We hear this fearful tempest sin,
Yet seek no shelter to avoid the storm. *Shakspeare*.

Them she upstays, mindless the while
Herself, though fairest unsupported flower,
From her best prop so far, and storm so nigh. *Milton*.

To **STORM**, in military matters, to make a violent assault on any fortified place or works. At the siege of Louisbourg, in the year 1758, the following anecdote occurred; and, as it

shows the superiority of true generalship over brutal courage, we recommend it to the perusal of every officer, and to the imitation of every general who may have the lives of his fellow-subjects entrusted to his judgment. The celebrated general Wolfe, always brave, always eager to put forth the energies of his nature, proposed to general Amherst, who commanded the besieging army, that the place should be stormed. The general asked his friend Wolfe, how many lives he thought it might cost? the latter said, about 300; and he then asked how long he thought it might hold out against a blockade? Not above three days. Well, then, let us wait three days, and save our men. The place surrendered on the second day.

STORMING PARTY, a select body of men, consisting generally of the grenadiers, who first enter the breach, &c.

STORNOWEY, a harbour and port of the custom-house in Ross-shire, island of Lewis, Scotland. It has a post-office and regular packet, which sails every week with the mail and passengers for the mainland. The houses in the town are in general well built; and, besides a neat and commodious custom-house, here is a town-house, an assembly-room, an elegant church, and two good school-houses.

STORTHING, the Norwegian *diet* (from *stor*, great, and *thing*, assembly). The citizens qualified to vote, choose electors, who, from among themselves or their constituents, select the representatives, whose number is not to be under seventy-five, nor above one hundred. A member of the *storthing* must be thirty years old; must have resided ten years in the realm; must hold no office, civil or military; must not be attached to the court, nor receive a pension. Generally the *storthing* is held every third year, at the beginning of February, in the capital, Christiania. After the *storthing* is opened by the king or his deputy, it chooses one fourth part of its members to form the *logthing*; the other three fourths form the *odelsting*. Each *thing* holds its sessions separately, and with open doors; and the debates are published, unless a resolution to the contrary be passed. The *storthing* is authorized to make and abolish laws; to impose taxes; open loans; see that the finances are properly administered; grant the civil list, &c. The government protocols, and all public papers, including treaties with foreign powers, must be laid before them, the secret articles only excepted, and these must not be contrary to the public ones; it may summon any body before it, except the king and viceroy; and it confers naturalization. Laws are proposed in the *odelsting*, by its members, or by a counsellor of state: if they pass there, they go to the *logthing*. The king is to sign the bills, or to decline so doing. If a bill, twice rejected by the king, is adopted without alteration by a third regular *storthing*, it becomes a law, even without the king's sanction. In this manner nobility was abolished in Norway.

STORY, *n. s. & v. a.* } Sax. *storp*; Belg. *Storie*, *adj.* } *storie*; Ital. *storia*; Gr. *ιστορια*; Lat. *historia*.

STORYTELLER, *n. s.* }

A history, particularly a short history; tale; an idle or trifling tale; account: as a verb active, to tell in history; relate: storied is furnished or adorned with stories: storyteller, a narrator of tales; generally used in condemnation or contempt.

How worthy he is, I will leave to appear hereafter, rather than *story* him in his own hearing.

Shakspeare. Cymbeline.

These flaws and starts would well become

A woman's *story* at a winter's fire,

Authorised by her grandame.

Id. Macbeth.

The fable of the dividing of the world between the three sons of Saturn arose from the true *story* of the dividing of the earth between the three brethren, the sons of Noah.

Raleigh.

Matters of fact, concerning times, places, persons, actions, which depend upon *story*, and the relation of others, these things are not capable of being proved by such scientific principles.

Wilkins.

It is *storied* of the brazen Colossus, in the island of Rhodes, that it was seventy cubits high; the thumbs of it being so big that no man could grasp one of them with both his arms.

Id.

This scene had some bold Greek or British bard Beheld of old, what *stories* had we heard

Of fairies, satyrs, and the nymphs their dames,

Their feasts, their revels, and their am'rous flames!

Denham.

And *storied* windows richly dight,
Casting a dim religious light.

Milton.

'Tis not vain or fabulous

What the sage poets, taught by the heavenly muse,

Horied of old in high immortal verse,

Of dire chimeras and enchanted isles,

And rifted rocks whose entrance leads to hell.

Id.

Thence I have heard relating what was done

Ere my remembrance: now hear me relate

My *story*, which perhaps thou hast not heard.

Id.

The four great monarchies make the subject of ancient *story*, and are related by the Greek and Latin authors.

Temple.

In such a satire all would seek a share,

And every fool will fancy he is there;

Old *storytellers* too must pine and die,

To see their antiquated wit laid by;

Like her who missed her name in a lampoon,

And grieved to find herself decayed so soon.

Dryden.

Governments that once made such a noise, as founded upon the deepest counsels and the strongest force, yet by some slight miscarriage, which let in ruin upon them, are now so utterly extinct that nothing remains of them but a name; nor are there the least traces of them to be found, but only in *story*.

South.

In the road between Bern and Seleurre, a monument erected by the republick of Bern tells us the *story* of an Englishman not to be met with in any of our own writers.

Addison.

Some greedy minion or imperious wife

The trophied arches, *storied* halls, invade.

Recite them, nor in erring pity fear

To wound with *storied* griefs the filial ear.

Id.

My maid left on the table one of her *story* books, which I found full of strange impertinence, of poor servants who came to be ladies.

Swift.

Company will be no longer pestered with dull, dry, tedious *storytellers*.

Id. Polite Conversation.

STORY, *n. s. & v. a.* Sax. *strop*, place. A floor; a flight of rooms: to range in floors, or one under another.

Avoid enormous heights of seven *stories*, and the contrary fault of low distended fronts.

Wotton.

Because all the parts of an undisturbed fluid are of equal gravity, or gradually placed or *storied* according to the difference of it, any concretion that can be supposed to be naturally and mechanically made in such a fluid, must have a like structure of its several parts; that is, either be all over of a similar gravity, or have the more ponderous parts nearer to its basis.

Bentley's Sermons.

Sonnets or elegies to Chloris

Might raise a house about two *stories*;

A lyrick ode would slate; a catch

Would tile; an epigram would thatch. *Swift.*

STOTHARD (Charles Alfred), a modern artist and antiquary of great talent, son of Thomas Stothard, R. A., was born July 5th, 1789. His paintings are remarkable for the faithful delineation which they exhibit of ancient costume: his drawings of the effigies of various members of the house of Plantagenet, taken from the abbey of Fontevraud, are equally curious and accurate; and it is satisfactory to reflect that his efforts not only succeeded in preserving copies of these relics, but mainly contributed to save the originals from destruction. In 1810 appeared his celebrated picture of the death of Richard II., and in the same year the first number of his Monumental Effigies of Great Britain, the tenth number of which was preparing for publication, when, by a melancholy accident, he was brought to an untimely end. In 1816 he visited France, and commenced at the instance of the Antiquarian Society his elaborate drawings of the celebrated tapestry of Bayeux; which he afterwards, in a memoir addressed to the society, proved from internal evidence to be contemporary with the commonly received era of its production, the period succeeding the Norman conquest. This little essay is to be found in the nineteenth volume of the *Archæologia*. In July 1819 he was elected a fellow of the Antiquarian Society; and in the same year made a series of drawings from the paintings then lately discovered on the walls of the painted chamber in the house of lords. Being engaged to make some illustrations for Mr. Lyson's *Magna Britannia*, he set out for that purpose on a tour through Devonshire, and was employed in the act of tracing the stained glass in a window over the altar of the parish church of Bere Ferrers, in that county, when the ladder on which he was standing giving way, he was precipitated to the earth, and, his head striking against the monument of a knight in the chancel, his life was instantaneously terminated by a concussion of the brain. This fatal accident took place on the 28th of May, 1821, in the thirty-fourth year of his age. He left behind him several manuscripts and unpublished drawings, especially a work on ancient seals, which he had begun, and materials for a work illustrative of the age of Elizabeth. He lies buried in the church which was the scene of his catastrophe.

STOVE, *n. s.* Sax. *stropoa*; Isl. *stoo*, a fire-place; Fr. *estuve*; Belg. *stove*.

For December, January, and the latter part of November, take such things as are green all winter; orange trees, lemon trees, and myrtles, if they be *stoved*; and sweet marjoram warm set.

Bacon.

Fishermen, who make holes in the ice to dig up such fish with their nets as resort thither for breath-

ing, light on swallows congealed in clods of a slimy substance, and, carrying them home to their stoves, the warmth recovereth them to life and flight.

Carew's Survey of Cornwall.

Stoves, which could autumn of cold winter make; Fountains in autumn to bring winter back.

Beaum. Psyche.

If the season prove exceeding piercing, in your great house kindle some charcoals; and, when they have done smoking, put them into a hole sunk a little into the floor, about the middle of it. This is the safest stove.

Evelyn.

The most proper place for unction is a stove.

Wiseman.

The heat which arises out of the lesser spiracles brings forth nitre and sulphur; some of which it affixes to the tops and sides of the grottos, which are usually so hot as to serve for natural stoves or sweating-vaults.

Woodward.

Stoves. Without pretending to explain the physical connexion of heat and light, we may observe that heat, as well as light, is communicated to distant bodies in an instant by radiation. A person passing hastily by the door of a glass-house feels the glow of heat in the very moment he sees the dazzling light of the furnace mouth, and it is interrupted by merely screening his face with his hand. In this way is an apartment partly warmed by an open fire; and we avoid the oppressive heat by sitting where the fire is not seen, or by interposing a screen. We are apt to connect this so strongly in the imagination with the light emitted by the fire, that we attribute the heat to the immediate action of the light. But this opinion is shown to be gratuitous by a curious experiment made before the Royal Society by Dr. Hooke, and afterwards, with more care and accurate examination, by Mr. Scheele. They found that by bringing a plate of the most transparent glass briskly between the fire and one's face, the heat is immediately intercepted without any sensible diminution of the light. Scheele, by a very pretty investigation, discovered that the glass made that separation, and did it both in refraction and reflection; for he found that, when the light of the same fire was collected into a focus by means of a polished metal concave speculum, a thermometer placed there was instantly affected. But, if we employ a glass speculum foiled in the usual manner with quicksilver, of the same diameter and focal distance, and of equally brilliant reflection, there is hardly any sensible heat produced in the focus, and the thermometer must remain there for a very long while before it is sensibly affected. When we repeated this curious experiment, we found that, after the glass has remained a long while in this position, whether transmitting or reflecting the light, it loses in a great measure its power of intercepting the heat. By varying this observation, in many of its circumstances, we think ourselves entitled to conclude that the glass absorbs the heat which it intercepts, and is very quickly heated by the absorption. While it rises in its own temperature, it intercepts the heat powerfully; but when it is, as it were, saturated, attracting no more than what it immediately imparts to the air in corporeal contact with it, the heat passes freely through along with the light. If the glass be held so near the fire

that the surrounding air is very much heated, no sensible interruption of heat is perceived after the glass is thus saturated. We found the check more quickly sensible than the thermometer of this instantaneous radiation of the heat which accompanies the light, or is separated from it in this experiment. It is a very instructive experiment in the physiology of heat. The accompaniment of light is not demonstrably necessary. We are certain that heat may be imparted without any sensible light, in a manner which we can hardly suppose any thing but radiation. If a piece of very hot iron be placed a little without the principal focus of a metallic concave speculum, and a very sensible air thermometer be placed in its conjugate focus, it will instantly show an elevation of temperature, although the iron is quite imperceptible to an eye which has even been a long while in the dark. No such rise of temperature is observed if the thermometer be placed a little to one side of the focus of the speculum; therefore the phenomenon is precisely similar to the radiation of light. We are obliged therefore to acknowledge that the heat is radiated in this experiment in the same way that light is in the common optical experiments. Although this is the most usual way that we in this country employ fuel for warming our apartments, it is by no means the only way in which the heat diffused from this fuel may be imparted to distant bodies. It is not even the most effectual method; it is diffused also by immediate communication to bodies in contact. The air in immediate contact with the burning fuel is heated, and imparts some of its heat to the air lying beyond it, and this is partly shared with the air which is still further off; and this diffusion, by communication in contact, goes on till the remote air contiguous to the walls, the floor, the ceiling, the furniture, the company, all get a share of it, in proportion to their attractions and their capacities. And as the air is thus continually supplied, and continually gives out heat, the walls, &c., become gradually warmer, and the room becomes comfortable and pleasant. But no great proportion of the heat actually acquired by the room is communicated in this way. This diffusion by contact is but slow, especially in air which is very dry; so slow, indeed, that the air in the immediate neighbourhood of the fuel is hurried up the chimney before it has time to impart any of the heat received in contact. We know that the time employed in diffusing itself in this way, through stagnant air, to any moderate distance, is very considerable. We imagine therefore that the heat communicated to our rooms by an open fire is chiefly by radiation, but in a way something different from what we mentioned before. We imagine that, as the piece of glass in Dr. Hooke's experiment absorbs the heat, so the whole mass of air which fills the room intercepts the radiated heat in every part of the room where the fire is seen, and is as it were saturated with it throughout, and ready to impart it to every body immersed in it. We cannot otherwise account for the equality of the heat in the different parts of the room. Mere radiation on the solid bodies would warm them in the inverse duplicate ratio of their

distances from the fire; and diffusion by contact, if compatible with the rapid current up the chimney, would heat the room still more unequally. But, because all parts of the air of the room absorb radiated heat, what is saturated at a higher temperature, being nearer to the fire, rises to the ceiling, spreads outwards along the ceiling, and has its place supplied by the air which is thus pushed towards the fire from the places which are not directly illuminated. Far different is the method of warming the room by a stove. Here the radiation, if any, is very feeble or scanty; and, if a passage were allowed up the chimney for the warmed air, it would be quickly carried off. This is well known to the English who reside in the cold climates of St. Petersburg, Archangel, &c. They love the exhilarating flutter of an open fire, and often have one in their parlour; but this, so far from warming the room during the extreme cold weather, obliges them to heat their stoves more frequently, and even abstracts the heat from a whole suite of apartments. But all passages this way are shut up when we warm a room by stoves. The air immediately contiguous to the stove is heated by contact, and this heat is gradually, though slowly, diffused through the whole room. The diffusion would however be very slow indeed, were it not for the great expansibility of air by heat. But the air surrounding the stove quickly expands and rises to the ceiling, while the neighbouring air slides in to supply the place, nay is even pushed in by the air which goes outwards aloft. Thus the whole air is soon mixed, and the room acquires almost an equal temperature throughout.

The warming by stoves must therefore be managed upon very different principles from those adopted in the employment of open fires. The general principle is, 1. To employ the fuel in the most effectual manner for heating the external part of the stove, which is immediately efficient in warming the contiguous air; and, 2. To keep in the room the air already warmed, at least as much as is consistent with wholesomeness and cleanliness. The first purpose is accomplished by conducting the flue of the furnace round its external parts, or, in short, by making every part of the flue external. Of all forms, that of a long pipe, returned backwards and forwards, up and down (provided only that the place of its last discharge be considerably higher than its entry from the fire-place), would be the most effectual. A very small stove constructed in this way, the whole being enclosed in a handsome case of polished iron plate, pierced and cut into elegant foliage like the cock of a watch, so that the odd looking pipes were completely concealed, though only three feet long, one foot thick, and six feet high, warmed a very lofty room of twenty-four feet by eighteen, and consumed less than half the fuel of a stove of the more usual make, which did not so fully warm a smaller chamber. It would occupy a volume to describe the immense variety of stoves which ingenuity or architectonic taste has constructed. We shall content ourselves with giving a specimen of the two chief classes into which they may be distinguished. The air of a room may be equally warmed, either by applying it to the

surface of a small stove made very hot, or to the surface of a much larger stove more moderately heated. The first kind is chiefly used in Holland, Flanders, and the milder climates of Germany and Poland. The last are universally used in the frozen climates of Russia and Sweden. The first are generally made of cast iron, and the last of brick-work, covered with glazed tiles or stucco.

The ancients are supposed to have used stoves which concealed the fire, but few traces remain of the manner in which they warmed their habitations. It is imagined they lighted the fire in a large tube in the middle of a room, of which the roof was open, and that the other apartments were warmed by portable braziers. In Seneca's time they began to construct tubes in the walls to convey the heat into the upper apartments, the fire-places being placed below. It appears, however, that this was the origin of flues for smoke, and even of stoves; the situation and proportions of which have successively undergone various changes according to the localities, the wants of the inhabitants, &c. The custom of heating apartments by fires placed under arches or vaults seems to be very ancient: but this was confined to palaces and other edifices on a large scale; and the vestiges that have been discovered among ancient ruins sufficiently point out their destination.

The northern Chinese have a method of warming the ground-floor which resembles the ancient plan. The floors are made of tiles a foot square and two inches thick; their corners being supported by bricks set on end, that are a foot long and four inches square; the tiles, too, join into each other by ridges and hollows along the sides under the whole floor, which on one side of the house has an opening into the air, where a fire is made; and it has a funnel rising from the other side to carry off the smoke. The fuel is a sulphurous pit-coal, the smell of which in the room is thus avoided, while the floor and room are well warmed.

Keslar of Frankfort, whose work, entitled 'Epargne-bois,' &c. (the Wood-saver, &c.), appeared, in French, in 1619, is the oldest writer who has any useful ideas on the subject of stoves. He formed eight chambers, one above another, through which the smoke was to pass before it entered the chimney. He also brought air directly from without into the ash-pan to feed the fire; and there was another aperture to draw air from the apartment for the same purpose. Savot, in the 'Architecture Française des Batimens particuliers' (i. e. Architecture of Private Houses), printed in 1625, gave some advice relative to the best method of constructing chimneys with scarcely any other object than to prevent their smoking.

In 1686 M. Dalesme suggested the idea of a stove without smoke, which he called *furnus acapnos*. Here the smoke is forced to descend into the fire-place where it is consumed. Dr. Franklin afterwards executed a very complete stove on that principle, and spoke of it, in 1773, as a mere curiosity or philosophical experiment.

The machine in question consisted of a tube of iron plate, such as is used for the flue of a Ger-

man stove. This was bent at right angles, and the part which was horizontal was about two feet in length, and joined to the rest of the tube which ascended vertically. At the opposite end of the horizontal part the furnace was made: it consisted of a cylindrical tube of plate-iron erected upon the horizontal tube near the end, and provided with a grating, upon which the fuel was placed; and the grate prevented the fuel falling down into the horizontal tube. To light this stove some clear burning charcoal was put into the large short tube or furnace, and supported on the grate. As soon as the tubes grew warm, the air within them would ascend in the perpendicular tube or chimney and go out at the top of it: fresh air must enter into the horizontal tube through the furnace. In this course it must descend through the burning fuel, and becoming heated by the burning coals, through which it has passed, would rise more forcibly in the longer tube in proportion to its degree of heat, or rarefaction, and the length of that tube. Such a machine is a kind of inverted siphon; and as the greater weight of water in the longer leg of the common siphon, in descending, is accompanied by an ascent of the same fluid in the shorter; so in this inverted siphon the greater quantity of levity of air in the longer leg, in rising, is accompanied by the descent of air in the shorter. The things to be burned being laid on the hot coals contained in the furnace, the smoke must descend through those coals and be converted into flame, which, after destroying the offensive smell, comes out at the end of the longer tube as mere heated transparent gas or vapor. Whoever would repeat this experiment must take care that the part of the short tube is quite full of burning coals, so that no part of the smoke may descend and pass by them without going through them and being converted into flame; and that the longer tube is so heated that the current of ascending hot air will be established in it before the things to be burnt are laid on the coals, otherwise there will be disappointment.

There is a German book, entitled *Vulcanus Famulans*, by Joh. George Leutmann, P. D., printed at Wirtemberg in 1723, which describes, among a great variety of other stoves, one which seems to have been formed on the same principle. It was probably taken from the hint thereby given. The construction is as nearly as possible the same, except in the proportion of the parts, the furnace being made in the form of a basin or vase, having the grate in the bottom.

Gauger, the author of *La Mécanique du Feu*, &c., printed at Paris in 1709, was the person to whom we are indebted for the first complete system of experiments on the circulation of heat by means of air-holes affording warm air; as also the manner of making one fire warm several rooms to send off the heat in elliptic curves. We here find a description of a chimney, with the back, the hearth, and the jambs, of hollow iron, to heat the air that is to enter the room: but it does not appear that this work produced much effect.

In 1745 Dr. Franklin published an account of the new stoves of Pennsylvania; the advantages of which he compares with those of the stoves of Ger-

many and Holland and the chimney of Gauger. In 1785 the doctor published the description of another stove which has the flame reversed, that is, it passes downwards through the fuel. The appearance of this stove is that of a vase of cast iron, with its pedestal; and this is mounted upon the top or lid of an air-box standing upon the hearth of the fire-place, and built close in a niche in the stone-work: but the vase being wholly detached from the back of the niche has a very neat appearance. The top of the vase turns back upon a hinge, so as to open like a lid, to put in the fuel; and the opening is covered by a brass frame which allows the air to enter. The bottom of the vase has in it an opening, of about two inches diameter, which leads through the stem or foot of the vase into a hollow iron box, forming the pedestal. At the bottom of this pedestal is a grating in the lid or top of the air-box upon which the vase stands. The air-box is divided by four partitions, between which the smoke passes and re-passes horizontally in a waving direction until it escapes into the chimney. Thus the smoke and flame, immediately after it has descended through the grate in the top of the air-box, passes backwards towards the chimney between the two middle partitions; but, as it cannot enter into the chimney at that part, it turns round the ends of those partitions and returns in two currents towards the front of the box; then returns again round the end of other partitions, and goes back into the chimney, which is behind, or rather at the sides of the niche in which the vase stands. The front plate of the air-box is made to slide in a groove, in two pieces, which meet together in the front like folding-doors; and these pieces being slid back expose the spaces between the partitions, which, as before-mentioned, act as winding flues for the smoke to circulate in, and give out its heat through the metal of the air-box. In the space between the two middle partitions, and into which the smoke first descends, a drawer is fitted to receive the ashes or cinders which may fall through the grate in the top of the air-box, and it can be readily withdrawn to clear it out. There is likewise a small grate at the lower part of the vase, upon which the fuel contained in the vase will rest. When this fuel is lighted, the flame and smoke will draw downward, and, descending through the grate, will pass through the hole in the bottom of the vase into the hollow pedestal, and through the grate in the top of the air-box: it then passes horizontally in the space between the two middle partitions of the air-box, and proceeds in the same direction towards the back of the chimney; there dividing, one part of it turns to the right and passes round the farther end of the middle partition; then coming forwards it turns round the near end of the outside partition; then moving backwards it arrives at the opening into the bottom of one of the upright corner funnels behind the niche, through which it ascends into the chimney, thus heating that half of the box and that side of the niche. The other part of the divided flame passes to the left, round the far end of the middle partition, round the near end of the outside partition, and so into and up the other corner funnel; thus heating the other half

of the box, and the other side of the niche. The vase itself, and the box, will also be very hot; and the air surrounding them being heated, and rising, as it cannot get into the chimney, it spreads in the room; colder air succeeding is warmed in its turn, rises and spreads, till by the continual circulation the whole is warmed. If there is occasion to make the fire when the chimney does not draw it must not be begun in the vase, but in one or more of the passages of the lower air-box; first withdrawing the sliding front of the air-box, and covering the mouth of the vase. After the chimney has drawn some time with the fire thus low, and begins to be a little warm, those passages may be closed and another fire kindled in the hollow pedestal, leaving its sliding shutter a little open; and when it is found that the chimney, being warmed, draws forcibly, that passage may be shut, and the vase opened, to make the fire there, as above directed. The chimney, well warmed by the first day's fire, will continue to draw constantly all winter, if the fire is made daily.

To avoid the inconvenience of smoke, the grate must be cleared before beginning to light a fire. If it is found clogged with cinders and ashes, the grate must be lifted up with the tongs to let them fall upon the grate in the top of the air-box: the ashes will go through it into the drawer, and the cinders may be raked off through a sliding door in the pedestal, and returned into the vase when they are to be burnt. Care must be taken that all the sliding-plates are in their places, and closely shut, that no air may enter the stove but through the round opening at the top of the vase; and, to avoid the inconvenience of dust from the ashes, let the ash-drawer be taken out of the room to be emptied. The passages should be cleaned or raked out when the draught of the air is strong inwards; and the ashes must be put carefully into the ash-box whilst it remains in its place. If it be required to prevent the fire burning in the absence of the proprietor, it may be done by removing the brass frame from the top of the vase, and covering the passage or opening into the top of the vase with a round tin-plate, which will prevent the entry of more air than barely sufficient to keep a few of the coals alive. When the fire is wanted, though some hours afterwards, by taking off the tin-plate and admitting the air the fire will soon be recovered. The effect of this machine is to burn not only the coals, but all the smoke of them; so that while the fire is burning, if the top of the chimney is observed, no smoke will be seen issuing, nor any thing but clear warm air, which, as usual, makes the bodies seen through it appear waving. But it must not be imagined from this that it can be a cure for bad or smoky chimneys, much less that, as it burns the smoke, it may be used in a room that has no chimney. It is only by the help of a good chimney, and the higher the better, that it produces its effect at all.

It is certain that heated clean iron yields no offensive smell: whatever smell of that kind is perceived where there are iron stoves, proceeds, therefore, from some foulness burning or fuming on their surface; they should, therefore, never be spit upon or greased, nor should any dust be

suffered to lie upon them. The advantages of the reversed flame in stoves are very considerable. The chimney does not grow foul, nor ever need sweeping; for, as no smoke enters it, so no soot can form in it. The air heated over common fires instantly quits the room and goes up the chimney with the smoke; but, in the stove, it is obliged to descend in flame, and pass through the long winding horizontal passages, communicating its heat to a body of iron-plate, which, having thus time to receive the heat, communicates the same to the air of the room, and thereby warms it to a greater degree. The whole of the fuel is consumed by being turned into flame, and the benefit of its heat is obtained; whereas, in common chimneys, a great part goes away in smoke, which may be seen as it rises, but it affords no rays of warmth. Some idea may be formed of the quantity of fuel thus wasted in smoke, by reflecting on the mass of soot that a few weeks' firing will lodge against the sides of the chimney; and yet this is formed only of those particles of the column of smoke which happen to touch the sides in its ascent. How much more must have passed off in the air? And we know that this soot is still fuel, for it will burn and flame as such; and, when hard caked together, is indeed very like and almost as solid as the coal from which it proceeds. The destruction of fuel goes on nearly in the same quantity in smoke as in flame, but there is no comparison in the difference of heat given. When fresh coals are first put on a fire a considerable body of smoke arises. This smoke is, for a long time, too cold to take flame; but, if a burning candle is plunged into it, the candle, instead of inflaming the smoke, will instantly be itself extinguished. Smoke must have a certain degree of heat to be inflammable. As soon as it has acquired that degree, the approach of a candle will inflame the whole body, and the difference of the heat which it gives will be very sensible. A still easier experiment may be made with a candle itself. Hold your hand near the side of its flame, and observe the heat it gives; then blow it out, the hand remaining in the same place, and observe what heat may be given by the smoke that rises from the still burning snuff; you will find it very little; and yet that smoke has in it the substance of so much flame, and will instantly produce it if you hold another candle above it so as to kindle it. Now the smoke from the fresh coals, laid on this stove, instead of ascending and leaving the fire, while too cold to burn, being obliged to descend through the burning coals, receives among them that degree of heat which converts it into flame; and the heat of that flame is communicated to the air of the room, as above explained.

Franklin's stove is very ingenious, and has been much used in France, where the management of coal fires, however, is but little understood. He completed the stove just described in 1771, and used it in London during three winters. While he was in France he contrived another grate for burning pit-coals, which has the same property of burning the smoke, and at the same time the fire is exposed in a grate. The grate is a short cylinder, with its axis placed horizontally, and the end turned towards the

apartment; one of its circular ends being made with bars, and the other is a back-plate. It is one foot (French) in diameter, and eight inches deep or long between the bars and the back: the sides and back are of plate iron, the sides having holes of half an inch diameter, and three or four inches distant from each other, to let in air for enlivening the fire: the back is without holes, and the sides do not meet at either the top or bottom by eight inches: and this square space is filled with grates of small bars, crossing from front to back to let in air below, and let out the smoke or flame above. The three middle bars of the front grate, that is, the circular end, are fixed; the upper and lower may be taken out and put in at pleasure, when hot, with a pair of pincers. The whole of this cylindrical grate turns upon pivots fixed in the opposite sides, across the centre of it: the pivots are supported by a crotchet, the stem of which is an inverted conical tube five inches deep, which fits as many inches upon a pin, which is fixed upright in a cast iron plate that lies upon the hearth. In the middle of the top and bottom grates are fixed small upright pieces, about an inch high, which, as the whole is turned on its pivots, stop it when the grate is perpendicular. By this means the grate can be inverted by turning it over upon its pivots; but, as that will present the back-plate to the apartment, it requires to be turned half round horizontally upon the conical pin to bring the front bars to the room. In making the first fire in the morning, with this grate, there is nothing particular to be observed: it is made as in other grates, the coals being put into the cylindrical grate above, after taking out the upper bar, which must be replaced when they are in. The round figure of the front bars filled with fire, when thoroughly kindled, is agreeable: it represents the great giver of warmth to our system. As it burns down it leaves a vacancy above, which must be filled with fresh coals, the upper bar is to be taken out, and fresh coals thrown in, the bar being afterwards replaced. The fresh coals, while the grate continues in the same position, will throw up, as usual, a body of thick smoke; but every one accustomed to coal fires in common grates must have observed that pieces of fresh coal stuck in below among the red coals have their smoke so heated as that it becomes flame as fast as it is produced, which flame rises among the coals, and enlivens the appearance of the fire. Here, then, is the use of this swivel-grate: by a push with the tongs or poker it can be turned over on its pivots till it is inverted, and the front bars face the back of the chimney; then turn it gently round on its vertical socket or axis till it again faces the room, whereby all the fresh coals will be found under the live ones, and the greater part of the smoke arising from the fresh coals will, in its passage through the live ones, be heated so as to be converted into flame. By this means much more heat is obtained from them, and the red coals are longer preserved from consuming. This construction, though not so complete a consumer of all the smoke as the vase, is yet fitter for common use, and very advantageous; it gives also a full sight of the fire always, a pleasing object which we

have not in the other. It may with a touch be turned more or less from any one of the company that desires to have less of its heat, or presented full to one just come out of the cold; and, when the front bars of the grate are supported in a horizontal position, a tea-kettle may be boiled on them.

Notwithstanding the advantages of Dr. Franklin's construction of a stove, the expense and trouble of it, and the difficulty of procuring workmen who understood the manner of executing it, have prevented the general use of it. Mr. James Sharp, with a view of obviating these objections and difficulties, has proposed several improvements, for which he has obtained his majesty's patent. According to the method which he proposes, they are easily accommodated to any rooms, where communications can be had with the external air; both to those which have, and those which have not chimneys: so that not only small rooms, but the largest halls, libraries, or churches, may be warmed in a more effectual manner than had ever been done before, and the greatest degree of heat produced from a given quantity of fuel. Mr. Sharp, by adding funnels to the top, renders these stoves fit for any chimney, and, by lengthening the funnel, to any place without a chimney. By the hollow base with which his stove-grates are furnished, he is able to apply them with much greater effect to the external air, without any addition of brick-work; and by the alterations in the air-box, a much greater quantity of warm air is introduced than it was possible to introduce in their former state. If a stove of this kind is to be placed in a common fire place, a hole must be made through the back of the chimney, or through the hearth, to communicate with the external air; and this hole should be made as large as possible, and in a descending position, so that the outward air may ascend towards the stove. The hollow base of the stove must be placed against this hole, so as to cover it completely; and the bottom of the base must be fitted so close to the earth, and pointed with lime or putty, that the air may not pass. Upon the stove there must be put a few feet of iron funnel to reach above the breast of the chimney; and the chimney enclosed by iron plates, so constructed and placed in a square or oblong iron frame that they may be easily removed when the chimney wants sweeping. By this construction the warm air introduced by the stove will be carried into the room, which would otherwise pass up the chimney and be lost. But if the stove is to be fixed in a room where there is no chimney, it may be placed in any part of it where communication may be had with the outward air; and nothing more is necessary than a sufficient length of funnel to carry it through the roof, or wall, or window, or into any other chimney that may be convenient. If the fire-place be too small for the stove, the chimney may be closed by the aforementioned frame and plates, and the stove stand before the fire-place, and the smoke be carried off, by the help of a circular elbow, into the chimney above the mantle-piece. Many of these stoves, it is said, have been lately put up in order to cure smoky chimnies, and have always succeeded. For further

particulars see Sharp's Account of the Air-Stove Grates, &c.

In the north of Europe the inhabitants have long been accustomed to the use of stoves in which the fire is shut up, and gives out its heat to a draught or current of air which is made to pass through proper openings in the stove, and when sufficiently warmed enters into the apartment. The smoke arising from the fuel is made to pass through a circuitous passage of flues, by which means the greatest part of the heat is absorbed. Stoves on this principle are known in England, but are very seldom used, except for warming of halls, staircases, and passages, in grand houses, as the English are not contented to feel the air warm unless they see the fire. In Russia, Sweden, and other northern countries, they are indispensably necessary. A common fire-place has too large an opening, and if care be not taken to supply it continually with wood, &c., the heat it produces is hardly sensible, because it follows the current of the air, and is carried off by the smoke. These stoves, on the contrary, retain the heat a much longer time; and as their external parts, and also their flues, are very thin, they communicate their heat very readily, so that with a small quantity of wood they warm an apartment much more than the fire of a common fire-place would do with six times the quantity. For it was not sufficient that the inhabitants of these severe climates should discover the most simple means of keeping up in their houses a comfortable degree of heat, it was also necessary that this should be done with the least possible expense of fuel. The stoves which they employ perfectly fulfil the above-mentioned intentions; they are also susceptible of every kind of ornament. The more surface we give to a stove constructed in this manner, the more the heat is increased; consequently we must not be surprised to find that this kind of stove sometimes occupies the whole height of an apartment, its width and depth being proportioned to its height.

The construction of these stoves is simple: they consist of four, five, or more small chambers built one above another: the lower one is for the fire which burns in it, and the smoke rising from it enters into the chamber immediately above, then into the third, and from that to the fourth. The passages or holes through which the smoke enters into one chamber from that beneath, are in all cases made at the corner of the chamber opposite to the passage at which the smoke will pass out from the same chamber to the next above it. By this means the smoke is obliged to pass through the whole of the chamber, and has the greatest chance of transmitting its heat. A fire lighted in one of these stoves early in the morning, and with a small quantity of fuel, retains a strong heat during the whole day. The door of the fire-place is only opened to put in wood, and remains afterwards constantly shut. The wood lies upon a grate, consequently it is not buried in and stifled by the ashes. The ash-hole is spacious, and one or two feet in height, according to the capacity of the stove. Two doors are placed at the extremities of the ash-hole, and the current of air is very considera-

ble, by which the smoke is carried up with great force, and the wood burns very briskly. Stoves of this kind may be advantageously placed in halls, at the bottom of staircases, and in the anti-chambers of great houses: they may also, by proportioning their size to that of the rooms for which they are intended, be made use of in the houses of private persons. To this it may perhaps be objected that the heat produced from these stoves is unwholesome, because they deprive the air of its moisture; and that the air, by being made too dry, loses its elasticity, in consequence of which respiration becomes difficult and laborious. These objections would appear of great weight if we had not the example of the Russians, the Swedes, the Danes, the Germans, and in short of all the inhabitants of the north of Europe, to show that those who are habituated to such stoves do not find them unwholesome. If others should be sensible of inconveniences from the dryness of the air in the apartment, it may be easily removed by the very simple expedient of placing upon the stove a vessel of glass or earthenware which has a large surface and is very shallow: this, being filled with water, will insensibly evaporate, and restore to the air that moisture of which the heat of the stove has deprived it: the air will then recover its elasticity. If orange trees are exposed to the heat of such a stove, and the fire is not properly regulated, the plants grow yellow and lose their leaves, especially if the air is not changed, which in winter is not very conveniently done; but, if a vessel of water be placed upon the stove, the evaporation of the water will preserve the trees.

In a memoir of M. Guyton in the *Annales de Chimie*, he has explained the construction of the stoves employed in Sweden, and recommends the adoption of one constructed on the same principle for general use in France. This memoir is translated in the *Repertory of Arts*, first series, vol. xvi.

The construction of the stove there recommended may be improved, to adapt it to our use in England, where pit-coal is used: but the following principles which the author lays down are very useful as guides in making all kinds of stoves for warming apartments. 1. Heat is produced only in proportion to the volume of air consumed by the fuel. 2. The quantity of heat produced is greatest (the quantity and quality of the fuel being the same) when the combustion is complete. 3. The combustion is the more complete in proportion as the fuliginous part is longer retained in channels where it may undergo a second combustion. 4. The only useful heat is that sent out into and retained in the space intended to be heated. The temperature of that space will be higher in proportion as the current which must be renewed from without to support the combustion is less enabled to take up in its passage the heat produced.

The following inferences evidently arise:—1. The fire-place ought to be insulated from all bodies that are rapid conductors of heat. All the heat that goes out of the apartment is absolutely lost, unless intentionally directed into another apartment. 2. Heat being produced only by combustion, and combustion being sustained

only by a current of air, the current should be brought in by channels where the needful rapidity may be preserved without being too distant from the space to be warmed, so that the heat it there deposits may be gradually accumulated in the whole of the insulated furnace, in order afterwards to flow out of it slowly, according to the laws of the equilibrium of that fluid. 3. The wood being so far consumed as to give no more smoke, it is advantageous to close the mouth of these channels, in order to retain there the heat that would otherwise be carried off through the upper flue by the continuance of a current of fresh air, necessarily of a low temperature. 4. Lastly; it follows from these maxims that, all things being equal, a higher temperature will be obtained and supported during a much longer time by forming, in the internal parts of the stove, or under the hearth of a chimney, and in their vicinity, tubes in which the air that comes from without may be warmed before it enters the apartment, to serve the purpose of combustion, or replace that which has been consumed. These have been called *bouches de chaleur* (mouths or apertures of heat); because, instead of contemplating their principal use and intention, it is commonly imagined that they are only made in order to give by their issues a more rapid current to the heat produced. Nor is this idea absolutely devoid of foundation, since the air that issues from them has only changed its temperature, by carrying off a portion of the heat that would have remained in the interior. Those, however, who would proscribe them, as opposing the most important object, which is the retaining of the heat as long as possible, do not consider that they may be closed, and all communication with the external air cut off by a simple slide, and therefore it is easy to derive from them every possible advantage without any inconvenience. And we may add that in small apartments, or such as are accurately closed, they are often indispensably requisite, if we could avoid being exposed to currents of cold air. Dr. Franklin very justly quotes a Chinese proverb to this effect: 'Shun a current of air from a narrow passage as you would the point of an arrow.'

The Swedish or Russian stoves, having chambers for the reception of the flame and smoke, are little known in this country: but those which are in common use in the halls and vestibules of our great houses are French stoves. They differ from the others in having a very great length of small flues or winding passages, through which the smoke passes, and communicates its heat to the air, which circulates in similar passages, until it becomes warmed, and makes its exit through the mouths into the apartment. This method is not so simple as the small chambers or apartments of the Russian stoves, nor is it so good in the long run; because the passages are very liable to become clogged with soot; and, even before they are so clogged as to intercept the passage of the smoke, the transmission of the heat is much impaired, because the interior surfaces of the flues, becoming coated with soot, do not conduct the heat so rapidly, and in consequence a great part will

still pass out into the chimney. Also these flues with small passages require a stronger draught in the chimney, to make the air pass through the passages, than when chambers are used. The *Holland* iron stove, which has a flue proceeding from the top, the fire place and ash-pit being closed by small iron doors opening into the room, comes next to be considered. It is frequently made of iron-plate, and is most commonly called a German stove. Its conveniences are, that it makes a room warm all over; for, the chimney being wholly closed, except the flue of the stove, very little air is required to supply that, and therefore not much rushes in at crevices, or at the door when it is opened. Little fuel serves, the heat being nearly all saved; for it radiates almost equally from the four sides, and the bottom and top, into the room, and presently warms the air around it, which being rarefied rises to the ceiling, and its place is supplied by the lower air of the room, which flows gradually towards the stove, and is there warmed and rises in its turn, so that there is a continual circulation, till all the air in the room is warmed. The air, too, is gradually changed by the stove doors being in the room, through which part of it is continually passing, and that makes these stoves more wholesome, or at least more pleasant, than the German stoves, next to be spoken of. But they have the inconvenience that there is no sight of the fire, which is in itself a pleasant thing, nor can any other use be conveniently made of the fire but that of warming the room.

The true *German* stove is made like a box, one side wanting, and that side is built against the wall of the room. It is composed of five iron plates screwed together, and fixed so as that the fuel can be put into it from another room, or from the outside of the house. It is a kind of oven reversed, its mouth being without and body within the room that is to be warmed by it. This invention certainly warms a room very speedily and thoroughly with little fuel: no quantity of cold air comes in at any crevice, because there is no discharge of air which it might supply, there being no passage into the stove from the room. These are its conveniences. Its inconveniences are, that people have not so much sight or use of the fire as in the *Holland* stoves, and are moreover obliged to breathe the same unchanged air continually, mixed with the breath and respiration from one another's bodies, which is very disagreeable to those who have not been accustomed to it. This may be remedied by making a small aperture into the flue, with a register to draw off the air. This kind of stove is still less in use in England than that which we have before described, and which is generally called the *German* stove, although it is used by the Dutch instead of the Germans.

Messrs. Strutt, in their cotton mills at Belper, in Derbyshire, have employed a kind of stove which is found to answer extremely well; it consists of what is called a *cockle*, that is, a square chest or vessel of iron plate, rivetted together in the manner of a boiler, and set in a furnace, so that a fire can be made withinside of

it upon a grate, and the smoke will pass off through a small passage into the flue which conducts to the chimney, the passage of which is regulated by a sliding damper. The cockle is of considerable dimensions, as much as four feet square and five feet in height, and the fire is made at the bottom of it, upon a grate of about fourteen inches by eighteen, so that the fire does not any where touch the inside of the cockle, but the heat rising up therein gives a considerable and equable heat, without rendering it so hot as to burn the air which it is intended to warm; for if that is once done the air will be rendered unpleasant. The cockle is enclosed in a casing of brick-work, which is of the same shape as the cockle, and leaves a space all round between of a few inches. This case of brick-work is again surrounded by walls of brick-work, leaving a space of about eighteen inches all round; and these walls are carried up above, to form the chimney or funnel to convey the warmed air up to the several apartments of the mill. This chimney is divided, by thin brick partitions, into as many different flues as there are floors to be warmed; and a small opening is made, with a register, from each flue into the apartment it is intended to supply. This opening is made close to the floor; and, in order to make a change of the air, ventilators are placed high up in the apartment, so as to be near the ceiling. This division of the chimney into several different flues is intended to equalise the supply of air to the several apartments, and by this means the upper apartments are equally well supplied with warm air as those below. In order to make the air pass in contact with the surface of the heated cockle, a horizontal partition is built in the space between the chimney and the brick-casing of the cockle. The level of this partition is at about one half the height of the cockle, and its effect is to divide the brick-casing of the cockle into two halves, one above the partition and the other below. The cold air is freely admitted into the lower part of the chimney beneath the partition, but cannot escape into the chimney above it, without entering into the space between the cockle and its brick-casing, through a number of small openings made in it beneath the horizontal position; and in thus passing in contact with the surface of the cockle the air becomes heated, and passes out again, through openings in the brick-casing, into the chimney above the partition. In order to make the cold air strike more forcibly against the heated surface of the cockle, a small iron tube is fitted through each of the openings in the lower part of the casing, and the ends of these tubes approach very near to the surface of the cockle. Mr. Strutt has introduced this kind of stove into the new infirmary at Derby, and in several other similar institutions it has been adopted with great success.

Mr. James Burns of Glasgow, in 1799, took out a patent for an improved stove, or fire-grate, to burn with an open fire: his stove has a very elegant appearance, and several advantages. The object of the improvement was to prevent the heat generated by combustion, and thrown out into the apartment by radiation, from being

unnecessarily wasted by the draught of air for the support of the fire, as is usual in stoves or grates of the common construction; where all the air that goes to maintain the combustion is furnished from the warm air in the room, the waste of which is supplied by the exterior cold air, which comes pouring into the room at the bottoms of the doors, or by the sides of the windows, and thereby undoes a great part of the effect that otherwise would be produced by the fire. To accomplish this intention, the air that maintains the fire in the improved stoves is brought through a tube, which is called the air-tube, from the outside of the house, and may be made to pass between two of the joists (where the floors and ceilings are close enough to allow this), so as to be brought to the bottom bars of the grate, without having any communication with the interior air of the room; while, at the same time, the grate and parts connected with it are so constructed that, when the fire is not wished to be supplied with cold air from the outside of the house, the passage may be shut more or less perfectly by means of a valve, a small door, a cock, or any similar contrivance. When convenience does not admit of the air-tube being carried to the outside of the house, it may be carried to a cellar, larder, or staircase, and the same end will be gained, with this farther advantage, that such cellar, or other apartment, will be always well ventilated, and prevented from acquiring or retaining any unhealthy or disagreeable smells. The principle is to supply the fire with air from without the room or apartment, so as to prevent the warm air of the room from being drawn to the fire place and hurried up the chimney, while, at the same time, all the advantages of open grates may be enjoyed.

The form of Burns' stove is that of a vase or urn placed in the chimney place, which is made circular, to form a niche for its reception. The urn is open at top, and the sides are formed of open work or grating, with a grated bottom, forming a sufficient space to contain the fire; but the pedestal and lower part of the vase are made close, to prevent the entrance of air to the fire, except that which passes up from the air-tube through the hollow pedestal; and within this pedestal is an air-valve, which opens and shuts by a register, to regulate the entrance of the current from the open air. In the pedestal of the vase is a drawer, to receive the ashes. The niche or chimney, in which the vase is placed, has the usual opening at top to carry off the smoke. The air for the support of the fire enters from the external air, through the tube or air-pipe before described, and passes into the hollow pedestal of the vase; and, having passed through the hollow neck or stem of the vase, it finds no difficulty in passing up through the bottom of the grate, the back or side of the ash-drawer next which the aperture is being made low, to allow it to flow in freely. The grate and its internal cavity may be of any convenient form, but circular or elliptical will answer best, especially when another improvement is applied. This is a glass talc or iron work fence or screen, to prevent those dreadful accidents which so frequently occur of ladies' or chil-

dren's clothes being set on fire by sparks from the grate. Where this safe-guard fence or screen is wished to be applied, the inside of the chimney where the grate is to stand must be a semi-cylinder, or nearly so, with a lining or cover, made of metal, at such a distance from the semi-cylindrical wall or niche in which the stove is placed, as to give sufficient room for allowing the safe-guard or fence to be slid round into it, when the fire is wished to be left open to introduce fresh fuel, or when the drawer with the ashes is to be removed. The fence is a frame-work of metal, which, when filled up with glass, or with wire-work, forms a portion of a cylinder, answerable to the curvature of the space between the back of the chimney and the lining above-mentioned, made in one or two pieces, and moving in a circular groove in the hearth, which serves to conduct it into its place behind the grate, when the fire-place is wanted to be left open, as before mentioned. The top of the front of the opening (the chimney piece) projects in a circular form, or is furnished with an added projection, made of metal, and furnished with a circular groove on its under surface, of the same radius as the groove in the hearth, for the purpose of guiding the upper part of the frame of the guard. The glass with which the frame of the guard is filled may be stained or painted: complete safety is thus obtained, and, at the same time, the comfort arising from the view of a cheerful fire is not prevented by the interposition of any opaque body. But for nurseries or the like, where convenience and safety are more the objects than elegance or luxury, the frame-work may be filled up with wire-work. Instead of such grooves at top and bottom for the fence to move in, the fence itself may be furnished with a groove at its top and one at its bottom, to receive any projecting piece of metal, or other substance of a proper curvature; or its bottom groove may receive the upper edge of the fender, which, being made to a proper curve, and properly adjusted and kept in its place, will answer the same end. But whichever of these ways be followed, or whatever other method of construction (for it may easily be varied to answer circumstances), rollers or castors should be provided at the lower part of the fence, to make it move with greater ease, either to the front of the grate, or into the space between the back of the chimney and the lining above-mentioned. Where either the glass or the wire-work frame, or both of them, are meant to be applied to square or rectangular chimneys, without the trouble of giving them a semi-cylindrical form, the lining to receive the fence or fences may be introduced at the sides, or jambs, of such chimneys; or the fence may be made to rise, by means of pulleys, into the wall above the opening, or be slid sideways into the walls at the sides of the openings. Besides the advantages already pointed out as connected with them, these stoves possess also the following:—any room or apartment may be heated by their means with a much smaller quantity of fuel than by common open fires; at the same time the advantage of seeing the fire is not lost, as in close stoves; for these grates have side as

well as bottom bars, which allow the radiant heat and light to be thrown out into the room, without any impediment; and, in fact, large rooms, halls, and the like, which by the usual methods can hardly be warmed, or made at all comfortable in cold weather, may, by means of these improvements, be heated as effectually as the smallest apartment; for, when their full effect is wanted to be procured, it is only necessary to keep the fence in its recess, that even that portion of heat which would be kept back by the interposed glass or wire-work may be thrown out into the room, and perform its office.

In 1804 Jowett of London obtained a patent for a similar contrivance, which he called a fire-guard stove, which is intended to prevent accidents from sparks of fire flying out. The stove itself is an open fire, and is usually made of a cylindrical form, the axis of the cylinder being vertical. One half of the cylinder which faces the apartment is made with bars at the lower part, to contain the fire, and an opening over them to feed it. The back part of the cylinder is made of cast iron bars; but, instead of the brick-work being built up close round the back, a small space is left to receive the guard. The weight of the stove or grate is supported upon a vertical iron bar, which is in the centre, or axis of the cylinder, which forms the stove, and the guard swings round upon this bar as a centre, and, being a half cylinder of wire-work, can be brought in front to enclose the fire, or it can be turned round behind the stove out of sight. The fire-guard may be fixed to any stove which will admit of two centres or pivots being placed in a perpendicular line in the back of the stove, to suspend the fire-guard, and guide its motion; and the stove must admit of grooves on either side, for the guard to pass through, as the levers will direct. The principle of the action of the fire-guard is that of being united to two centres or pivots, placed perpendicular one to the other; and it is connected to the two centres fixed to the stove by means of two lever-cranks, one end of which is fixed to the guard, and the other end of each to the centres or pivots, by which the guard swings in a rotatory motion, passing through a groove formed in the stove on either side, to swing before the fire when required, and is brought into use by means of a handle or nob, fastened to the front edge of the frame of the guard for that purpose; or instead of drawing it out with the hand, as before described, it may be brought into use by means of a spring fastened to the crank, and pressing against the cheek or back of the stove, to throw the guard forward. The same effect may be produced by means of a balance fastened to any part of the fire-guard, and working with a line or chain over pulleys fixed to the stove, or by means of the combined force of the spring and balance.

An important improvement in those fire-places for burning of coal, which are generally called register-stoves, has been lately made by Mr. John Cutler of London, for which he had a patent in 1815. The stoves constructed by him are nearly such as are known by the name of register-stoves, being made of cast iron plate

to enclose the fire-plate at the back and sides, but open in front to the apartment; leaving only a passage for the smoke through a register, at the upper part of the enclosed space. Mr. Cutler's improvement consists in applying to such grates or stoves a chamber, or magazine, situated beneath the grate (or the space enclosed by grating) in which the fire is to burn. This chamber is to contain a magazine of fuel sufficient to supply the combustion for a whole day, or other required space of time: the bottom plate of the chamber is moveable; and, by means of a wheel and axle, the fuel contained in the magazine can be elevated, so as to introduce a portion of the fuel into the grate at the lower part, or from beneath; and thus, from time to time, replace the fuel which is consumed, without the trouble of occasionally throwing on coals. In order to make the fire burn, the flue or entrance to the chimney must be of such a construction as will produce the most efficient draught or current of air to pass through and across the top of the fire. This improvement, of introducing a supply of fuel into the grate from beneath, causes the fire to burn clear and with little smoke; because the smoke, or gas, which issues from the newly introduced fuel, when it is first heated, must of necessity ascend through the burning fuel, and be thereby consumed. Another improvement is to reduce the fire, or extinguish it, when it is left for the night. This is done by lowering down the whole of the fire from the grate into the chamber, or magazine, beneath the grate: the supply of air is thus interrupted, and the fire is completely enclosed in a deep chest, so that it is impossible sparks can fly out, and the fire soon becomes extinguished. The advantages of these improvements are by no means trifling. By burning the smoke the whole effect of the fuel consumed is produced; and, were this invention universally introduced into London, that pernicious sooty atmosphere in which it is hidden would be so improved as to be equally pure with that of Paris, or other continental cities, where wood alone is used for fuel. The burning of the smoke renders the sweeping of the chimneys unnecessary, and the danger of fire from the soot contained in the flue is avoided: also chimneys which throw out smoke into the room will, in almost all cases, be cured by this improvement, because the quantity of air or gas which must pass through the chimney is so small. To avoid the trouble of throwing on coals, and to have at all times a bright and cheerful fire, are matters of convenience, but are not wholly to be overlooked: and, lastly, to have the means of extinguishing the fire, when it is left for the night, is a most important improvement, when it is considered that, amongst the fires which happen every year in London, how many break out in the hours when the fires are left, and a great proportion are doubtless occasioned by fires left unextinguished. The machinery for raising up the moveable bottom of Mr. Cutler's stove is simple. The magazine chamber is composed of iron plates screwed together, and the moveable bottom is fitted to it, so as to leave as small a space round the edges as possible. A bar is fixed across, beneath the

bottom plate; and the ends of this bar pass through slits, or narrow openings, in the side plates of the chamber. To the extremities of the bar the ends of two chains are attached, and the upper ends of these chains are made to wind upon the ends of a horizontal axle, which extends over the top of the stove, so as to be within the chimney, and out of sight. The axle is turned round by a face or crown-wheel, fixed upon the extremity of it, and the teeth thereof are engaged by the teeth of a small pinion, the axis of which comes through the iron work of the stove; and the end has a small square hole in it, to receive a square or key upon a small winch handle. By means of this handle, the iron axle is turned round, and winds up the chains, so as to elevate the bottom plate of the magazine, and thereby raise up a portion of fresh fuel into the lower part of the grate, where it is burned, as before mentioned; and the smoke which first issues from the coal rises through the fire, and is thereby consumed.

STOUND, *n. s.* From the verb. Sorrow; grief; mishap. Out of use. The Scots retain it.

Begin and end the bitter baleful *stound*,
If less than that I fear. *Spenser.*

Thus we stood, as in a *stound*,
And wet with tears, like dew, the ground. *Gay.*

STOUR, *n. s.* Sax. *ƿæopan*, to disturb; Runick *stur*, a battle. Assault; incursion; tumult. Obsolete.

And he that harrowed hell with heavy *stour*,
The faulty souls from thence brought to his heavenly
bower. *Spenser's Faerie Queene.*

Love, that long since has to thy mighty powre
Per force subdued my poor captivated heart,

And raging now therein with restless *stours*,
Dost tyrannize in every weaker part. *Spenser.*

STOURBRIDGE, or **STURBRIDGE**, the name of a field on the banks of the Stour, near Cambridge, noted for its fair held annually on the 18th of September, under the jurisdiction of the university of Cambridge, and continuing a fortnight. But it has of late years much declined.

STOURBRIDGE, a flourishing market town and township, forming the central division of the parish of Old Swinford, in the lower division of the hundred of Halfshire, is 126 miles from London, twenty-one from Worcester, twelve from Birmingham, and seven from Kidderminster; situated at the south-western extremity of the great midland mining and manufacturing district of England, on the south bank of the river Stour, and near to the head of the Staffordshire canal, by which it enjoys a water communication with all parts of the kingdom. The appellation of Stourbridge was derived from a bridge erected over the river in the reign of Henry VIII. previous to which time the township was known by the name of Bedcote, which is still the designation of a contiguous manor. Its vicinity abounds with valuable mines of coal, iron-stone, and clay. Various branches of the iron manufactory are carried on here and in the adjacent villages, which give employment to several hundred hands. The church, or rather chapel of ease to Swinford, situate in the Rye-market, is dedicated to St. Thomas, and was built by voluntary subscription; it is not consecrated, which gives the inhabitants the privilege of electing a pastor in-

dependant of the parish rector. The other places of worship are a chapel each for the presbyterians, calvinists, methodists, Roman Catholics and Quakers. The chief market is on Friday, but on Saturday, the town is also well supplied with every necessary of life. The fairs are March 22nd and September 9th; the first continues seven days, and is a widely-noted horse fair. Population 5,090.

STOURPORT, a market town of Worcester, on the banks of the Stour, near its junction with the Severn. It is a place which owes its existence, as well as its increasing trade and prosperity, to the formation of the Trent and Severn, or Staffordshire and Worcestershire canal, which entering the latter county at Wolverley, and following the course of the Stour for about nine miles, terminates in a basin at Stourport, where it joins the Severn. This basin was begun in 1768, and finished in 1771. Previous to this there was no appearance of a town here. Population 4000. Here is an elegant iron-bridge over the Severn, consisting of one arch of 150 feet span, and fifty feet above the surface of the river. Stourport takes the lead of all other places in the kingdom as a mart for hops, apples, and perhaps for corn. Markets on Wednesday and Saturday.

STOUT, *adj. & n. s.* } Sax. *duht*; Belg. *stout*;
STOUTLY, *adv.* } Goth. *stautan*, to strike.
STOUTNESS, *n. s.* } Strong; lusty; valiant;
 resolute; firm: the adverb and noun substantive
 corresponding: stout is also a name for strong beer.
 The stout-hearted are spoiled. *Psalm lxxvi. 5.*
 His bashfulness in youth was the very true sign
 of his virtue and stoutness after.

Ascham's Schoolmaster.

When I was young,
 I do remember how my father said,
 A stouter champion never handled sword.

Shakspeare. Henry VI.

Come all to ruin, let
 Thy mother rather feel thy pride, than fear
 Thy dangerous stoutness: for I mock at death
 With as stout heart as thou. *Id. Coriolanus.*

The lords all stand,
 To clear their cause, most resolutely stout. *Daniel.*
 Some captain of the land or fleet,
 Stout of his hands, but of a soldier's wit,
 Cries, I have sense to serve my turn, in store,
 And he's a rascal who pretends to more. *Dryden.*
 The stoutest vessel to the storm gave way,
 And sucked through loosened planks the rushing sea. *Id.*

There virtue and stout honour passed the guard,
 Those only friends that could not be debarred. *Bathurst.*

STOW, *v. a.* } Sax. *stow*; Belg. *stowen*,
STOWAGE, *n. s.* } to lay up. To lay up; re-
 posit in order, or in the proper place.

Foul thief! where hast thou stowed my daughter?
Shakspeare.

So gives the' adventurous merchant, when he
 throws
 All his long-toiled-for treasure, his ship stows
 Into the angry main. *Carew.*

I' the' holsters of the saddle-bow
 Two aged pistols he did stow. *Hudibras.*
 Some stow their oars, or stop the leaky sides. *Dryden.*

All the patriots were beheaded, stowed in dungeons,
 or condemned to work in the mines. *Addison.*

In every vessel is stowage for immense treasures,
 when the cargo is pure bullion, or merchandise of as
 great a value. *Id.*

The goddess shoved the vessel from the shores,
 And stowed within its womb the naval stores. *Pope.*

Stow (John), the industrious historian, son of Thomas Stow, merchant-tailor of St. Michael's Cornhill, in London, was born about 1525. He was bred to his father's business, which in 1560 he relinquished, devoting himself entirely to the study of our ancient historians, chronicles, annals, charters, registers, and records. Of these he made a considerable collection, travelling for that purpose to different parts of the kingdom, and transcribing such MSS. as he could not purchase. But, this profession of an antiquary being attended with no present emolument, he was obliged for subsistence to return to his trade. It happened, however, that his talents and necessities were made known to Dr. Parker archbishop of Canterbury, who, being himself an antiquary, encouraged and enabled Mr. Stow to prosecute his darling study. In those times of persecution, though Elizabeth was then upon the throne, honest John Stow did not escape danger. His collection of popish records was deemed cause of suspicion. His younger brother Thomas preferred no less than 140 articles against him before the ecclesiastical commission; but, the proof being insufficient, he was acquitted. In 1565 he first published his Summary of the Chronicles of England. About 1584 he began his Survey of London. In 1585 he was one of the two collectors for a great muster of Lime Street ward. He was principally concerned in the second edition of Hollinshed's chronicle, published in 1587. He also corrected, and twice augmented Chaucer's works, published in 1561 and in 1597. His Survey of London was first published in 1598. To these laborious works he would have added his large Chronicle, or History of England; but he lived only to publish an abstract of it, under the title of Flores Historiarum. The folio volume, which was printed after his death, with the title of Stow's Chronicle, was taken from his papers by Edmund Howes. Having thus spent his life and fortune in these laborious pursuits, king James I. granted him, in 1603, a brief, which was renewed in 1604, authorizing him to collect in churches the benefactions of his fellow citizens. He died in April 1605, aged eighty; and was buried in his parish church of St. Andrew's Undershaft, where his widow erected a decent monument to his memory. John Stow was a most indefatigable antiquarian, a faithful historian, and an honest man.

Stow, a parish in Buckingham hundred, Buckinghamshire, three miles from Buckingham, and sixty from London; chiefly noted for containing the magnificent seat, gardens, and grounds of the duke of Buckingham, the great ornament of the country. Stow was visited by the most distinguished poets and literati of the last century; and Pope, Chesterfield, Hammond, Lyttleton, Pitt, and West, were among its frequent guests.

STOW-MARKET, a market-town of Stow hundred, Suffolk, situate on the banks of the Orwell, three miles from Needham, and seventy-five N. N. E. of London. Besides the river it has a navigable canal to Ipswich. A manufacture of

sacking, ropes, &c., is carried on in this town, which has also succeeded in making tammies and various kinds of Norwich stuffs. Here is likewise a good malting trade. The church is a spacious building, having a steeple with a spire, 120 feet high, containing eight bells. Market on Thursday. Fairs, Whit-Friday, and June 29th, and a lamb fair on August 1st.

STOW-ON-THE-WOLD, a market-town and parish in Slaughter hundred, Gloucester, near the river Windrush, eleven miles S. S. E. from Campden, and seventy-seven west by north of London. It stands in a very bleak part of the country, on a high eminence; the buildings are very irregular, and the streets but indifferently paved. Its ancient church is situate on a hill, has a lofty tower, and contains several ancient monuments. Here are an hospital, free-school, and alms-houses, all well endowed. Shoes are the principal manufacture. This parish extends twelve miles in circumference, and was formerly a corporation; it is now governed by two bailiffs. Market on Thursday. Fairs, May 12th, and October 24th, which have long been noted for the quantities of hops, cheese, and sheep, annually sold here.

STOWAGE, in sea language, is the general disposition of the several materials contained in a ship's hold, with regard to their figure, magnitude, or solidity. In the stowage of different articles, as ballast, casks, cases, bales, and boxes, there are several general rules to be observed, according to the circumstances or qualities of those materials. The casks which contain any liquid are, according to the sea phrase, to be bung up and bilge free, i. e. closely wedged up in a horizontal position, and resting on their quarters; so that the bilges where they are thickest, being entirely free all round, cannot rub against each other by the motions of the vessel. Dry goods, or such as may be damaged by the water, or to be carefully enclosed in casks, bales, cases, or wrappers; and wedged off from the bottom and sides of the ship, as well as from the bow, masts, and pump-well. Due attention must likewise be had to their disposition with regard to each other, and to the trim and centre of gravity of the ship; so that the heaviest may always be nearest the keel, and the lightest gradually above them.

STRABO, a celebrated Greek geographer, philosopher, and historian, born at Amasia, and descended from a family settled at Gnossus in Crete. He was the disciple of Xenarchus a Peripatetic philosopher, and at length attached himself to the Stoics. He contracted a strict friendship with Cornelius Gallus, governor of Egypt, and travelled into several countries to observe the situation of places, and the customs of nations. He flourished under Augustus, and died under Tiberius about A. D. 25, in a very advanced age. He composed several works, all of which are lost, except his Geography in seventeen books; which are justly esteemed very precious remains of antiquity.

STRADA (Famianus), a very ingenious and learned Jesuit, born at Rome in 1572, where he taught rhetoric for fifteen years. He wrote several pieces upon the art of oratory, and published

some orations with a view of illustrating by example what he had inculcated by precept. But his *Prolesiones Academicæ* and his *Historia de Bello Belgico* are the works which raised his reputation, and have preserved his memory. His history of the war of Flanders was published at Rome; the first deced in 1640, the second in 1647. He died in 1649, aged seventy-seven.

STRADDLE, *v. n.* From striddle or stride. To stand or walk with the feet removed far from each other to the right and left; to part the legs wide.

Let the man survey himself, divested of artificial charms, and he will find himself a forked *straddling* animal, with bandy legs. *Arbutnot and Pope.*

STRADELLA (Alessandro), a Neapolitan musician and composer, one of the most celebrated writers of vocal music in the seventeenth century. His private history is romantic. While yet a youth he was employed by a Venetian nobleman to instruct his mistress, Hortensia (a girl descended of a patrician family at Rome, whom he had seduced), in the art of singing. A strong and mutual attachment between the master and pupil ensued; then an elopement; and the lovers fled to Rome. To this city they were followed by two ruffians, despatched by the Venetian to assassinate Stradella. The opportunity selected to carry this murderous design into execution was the evening after an oratorio of the intended victim's composition, in which he was both to play and sing in the church of St. John Lateran; on his return from which they determined to avail themselves of the darkness of the evening. Entering the church, during the performance, they resolved to wait quietly till its conclusion, but long before that took place, their hearts were so softened by its excellence that they found it impossible to execute their design, and, accosting him in the street, confessed their errand, and recommended him to flee to some safer asylum. He retired to Turin, where the duchess of Savoy, to whom they confessed their danger, placed the lady in the security of a convent, and retained Stradella in the palace as her chapel master. Their vindictive enemy however; enraged at their escape, sent after them two other-emissaries less accessible to the charms of music, who after residing for some time in the city under a passport from the French ambassador at Venice, in the character of merchants, at length surprised Stradella walking one evening on the ramparts, and plunged their daggers into his breast. This done, they took refuge in the house of the marquis de Villars, ambassador from the court of France to that of Turin, who, insisting on his privilege, refused to give them up; and eventually, when acquainted with their real characters, allowed them to escape. In the mean time Stradella, whose wounds were not mortal, slowly recovered, and, a year having elapsed, he fancied the vengeance of his enemy had been satiated. In this supposition he was fatally deceived; for, being invited to Genoa to compose an opera in the year 1678, he set out with his wife for that city, intending to return to Turin for the carnival; but scarcely had they reached the place of their destination when a third set of assassins found

mean to enter their chamber early one morning, and, stabbing them both to the heart, effected their escape by means of a boat. Of the works of this unfortunate man, the most celebrated are John the Baptist, an oratorio written for five voices; and a serious opera, the production of which at Genoa proved so disastrous to him, entitled *La Forza dell' Amor paterno*.

STRAETEN (N. Vander), a celebrated Dutch painter, born in 1680. He visited London, and travelled through great part of Europe, being esteemed one of the best portrait-painters of his time. But he fell a victim at last to intemperance.

STRAG'GLE, *v. a. & v. n.* } A frequentative
STRAG'GLER, *n. s.* } of stray, from
 Ital. *straviare*, of Lat. *extra viam*. To wander without certain direction; to rove; ramble; exuberate: be dispersed, or stand single: the noun substantive corresponding.

The last should keep the countries from passage of *stragglers* from those parts, whence they use to come forth, and oftentimes use to work much mischief. *Spenser's Ireland*.

Let's whip these *stragglers* o'er the seas again,
 Lash hence these over-weening rags of France,
 These famished beggars. *Shakspeare. Richard III.*

He likewise enriched poor *stragglings* soldiers with great quantity. *Id. Timon*.

Having passed the Syrens, they came between Scylla and Charybdis, and the *stragglings* rocks, which seemed to cast out great store of flames and smoke. *Raleigh*.

But stay; like one that thinks to bring his friend
 A mile or two, and sees the journey's end,
 I *straggle* on too far. *Suckling*.

They found in Burford some of the *stragglings*
 soldiers, who out of weariness stayed behind. *Clarendon*.

Wide was his parish, not contracted close
 In streets, but here and there a *stragglings* house;
 Yet still he was at hand. *Dryden*.

Let thy hand supply the pruning knife,
 And crop luxuriant *stragglers*, nor be loth
 To strip the branches of their leafy growth. *Id.*

A wolf spied out a *stragglings* kid, and pursued him. *L'Estrange*.

Children, even when they endeavour their utmost,
 cannot keep their minds from *stragglings*. *Locke*.

Trim off the small superfluous branches on each
 side of the hedge, that *straggle* too far out. *Mortimer's Husbandry*.

Form *stragglings* mountaineers for public good,
 To rank in tribes, and quit the savage wood;
 Houses to build, and them contiguous make,
 For cheerful neighbourhood and safety's sake. *Tate*.

His pruning hook corrects the vines,
 And the loose *stragglers* to their ranks confines. *Pope*.

Bottles missing are supposed to be half stolen by
stragglers, and the other half broken. *Swift*.

STRAHAN (William), an eminent printer, born at Edinburgh, in 1715. His father, who had a small appointment in the customs, gave his son a liberal education. He was bred a printer, and while very young went to follow his trade in London. Sober, diligent, and attentive, while his emoluments were scanty, he lived rather within than beyond his income; and though he married early, and without such a provision as prudence might have dictated, he

continued to thrive, and to better his circumstances. In 1770 he purchased a share of the patent for king's printer of Mr. Eyre. He now began to purchase copyrights, and gave authors more liberal prices than had been usual. In 1755 he was elected M. P. for Malmesbury in Wiltshire, with a very illustrious colleague, the hon. C. J. Fox; and, in the succeeding parliament, for Wootton Bassett, in the same county. In this station he was a useful member, and attended the house with a scrupulous punctuality. His talents for business were not unnoticed by the minister. In his political connexions he was a steady supporter of that party who were turned out of administration in 1784, and lost his seat by the subsequent dissolution of parliament. He died on the 9th of July 1785, aged seventy-one. In his elevated fortune none of his former acquaintance ever accused him of neglect. He attained prosperity without envy, enjoyed wealth without pride, and dispensed bounty without ostentation.

STRAIGHT, *adj. & adv.* } Sax. *reþac*; Belg.
STRAIGHT'EN, *v. a.* } *strack*; Dan. and
STRAIGHT'NESS, *n. s.* } Scots *strak*. It is
STRAIGHT'WAY, *adv.* } observed by Ainsworth, that for not crooked we ought to write straight, and for narrow, strait; but for streight, which is sometimes found, there is no good authority. Not crooked; direct; hence tense; tight: as an adverb, directly; immediately. straightway is a synonyme of straight as an adverb: to straighten is, to make straight; make orderly; tighten: the noun substantive corresponding.

Let me here for ay in peace remain,
 Or *straightway* on that last long voyage fare. *Spenser*.

Soon as he entered, the door *straightway*
 Did shut. *Id.*

A crooked stick is not *straightened*, except it be as far bent on the clean contrary side. *Hooker*.

Of ourselves being so apt to err, the only way which we have to *straighten* our path is, by following the rule of his will, whose footsteps naturally are right. *Id.*

Beauty made barren the swelled boast
 Of him that best could speak; feature, laming
 The shrine of Venus, or *straight-pight* Minerva. *Shakspeare*.

If the devil come and roar for them,
 I will not send them. I will after *straight*,
 And tell him so. *Id. Henry IV.*

Like to a ship, that, having 'scaped a tempest,
 Is *straightway* claimed and boarded with a pirate. *Shakspeare*.

A hunter's horn and cornet is oblique; yet they have likewise *straight* horns; which, if they be of the same bore with the oblique, differ little in sound, save that the *straight* require somewhat a stronger blast. *Bacon's Natural History*.

Queen Elizabeth used to say of her instructions to great officers, that they were like to garments, *strait* at the first putting on, but did by and by wear loose enough. *Bacon*.

Those stinks which the nostrils *straight* abhor and expel are not the most pernicious. *Id. Natural History*.

Some are for masts, as fir and pine, because of their length and *straightness*. *Id.*

As soon as iron is out of the fire, it deadeth *straightways*. *Bacon*.

The sound of a bell is strong; continueth some

time after the percussion ; but ceaseth *straightways* if the bell or string be touched.

Id. *Natural History.*

There are many several sorts of crooked lines ; but there is one only which is *straight*. *Dryden.*

With chalk I first describe a circle here,
Where the ætherial spirits must appear :
Come in, come in ; for here they will be *straight* ;
Around, around the place I fumigate. *Id.*

I know thy generous temper well ;
Fling but the appearance of dishonour on it,
It *straight* takes fire, and mounts into a blaze. *Addison.*

Water and air the varied form confound ;
The *straight* looks crooked, and the square grows round. *Prior.*

The sun's power being in those months greater, it then *straightways* hurries steams up into the atmosphere. *Woodward.*

When I see a *straight* staff appear crooked while half under the water, the water gives me a false idea. *Watts's Logic.*

STRAIN, *v. a., v. n., & n. s.* } Fr. *estrain-*
STRAIN'ER, *n. s.* } *dre* ; Italian
strignere ; Lat. *stringo*. To compress ; constrain ; squeeze through something ; filtrate ; put to the utmost strength ; force in any way ; distort ; sprain ; weaken by violence : as a verb neuter to make violent efforts ; be filtered : an injury through violence ; also a race ; pedigree ; descent ; hereditary disposition (probably of Sax. *tryjan*, to beget) ; rank ; character ; style ; manner ; tone ; rate ; turn : a strainer is an instrument of filtration.

The jury make no more scruple to pass against an Englishman and the queen, though it be to *strain* their oaths, than to drink milk unstrained. *Spenser's State of Ireland.*

Too well I wote my humble vaine,
And how my rhimes been rugged and unkempt ;
Yet as I con my cunning I will *strain*. *Spenser.*

By this we see, in a cause of religion, to how desperate adventures men will *strain* themselves for relief of their own part, having law and authority against them. *Hooker.*

Thus far I can praise him ; he is of a noble *strain*,
Of approved valour. *Shakspeare.*

Amongst these sweet knives and all this courtesy!
The *strain* of man's bred out into baboon and monkey. *Id.*

Wilt thou love such a woman ? what, to make thee an instrument, and play false *strains* upon thee ? *Id.*

Thus mine enemy fell,
And thus I set my foot on's neck ;—even then
The princely blood flows in his cheek ; he sweats,
Strains his young nerves, and puts himself in posture
That acts my words. *Id. Cymbeline.*

The lark sings so out of tune,
Straining harsh discords and displeasing sharps. *Shakspeare.*

You stand like greyhounds in the slips,
Straining upon the start. *Id. Henry V.*

Earth doth not *strain* water so finely as sand. *Bacon.*

Such take too high a *strain* at the first, and are magnanimous more than tract of years can uphold ; as was Scipio Africanus, of whom Livy saith, 'ultima primis cedebant.' *Id.*

The excrementitious moisture passeth in birds through a finer and more delicate *strainer* than it doth in beasts ; for feathers pass through quills, and hair through skin. *Id.*

Cæsar thought that all sea sands had natural springs of fresh water : but it is the sea-water, because the pit filled according to the measure of the tide ; and the sea-water, passing or *straining* through the sands, leaveth the saltness behind them. *Id.*

A bigger string more *strained*, and a lesser string less *strained*, may fall into the same tone. *Id.*

Because hereticks have a *strain* of madness, he applied her with some corporal chastisements, which with respite of time might happily reduce her to good order. *Hayward.*

Twelve Trojan youths, born of their noblest *strains*

I took alive ; and, yet enraged, will empty all their veins

Of vital spirits. *Chapman's Iliad.*

They *strain*,
That death may not them idly find t' attend
Their certain last, but work to meet their end. *Daniel.*

Intemperance and lust breed diseases, which, propagated, spoil the *strain* of a nation. *Tillotson.*

He talks and plays with Fatima, but his mirth
Is forced and *strained* : in his looks appears
A wild distracted fierceness. *Denham.*

Orpheus' self may heave his head
From golden slumber on a bed
Of heaped Elysian flowers, and hear
Such *strains* as would have won the ear
Of Pluto, to have quite set free
His half-regained Eurydice. *Milton.*

My earthly by his heavenly overpowered,
Which it had long stood under, *strained* to the height,

In that celestial colloquy sublime,
As with an object that excels the sense,
Dazzled and spent, sunk down. *Id. Paradise Lost.*

Why dost thou falsely feign
Thyself a Sidney ? from which noble *strain*
He sprung, that could so far exalt the name
Of love. *Waller.*

Credit is gained by custom, and seldom recovers a *strain* ; but, if broken, is never well set again. *Temple.*

Old Evander with a close embrace
Strained his departing friend, and tears o'erflowed his face. *Dryden's Æneid.*

But thou who, lately of the common *strain*,
Wert one of us, if, still thou dost retain,
The same ill habits, the same follies too,
Still thou art bound to vice, and still a slave. *Dryden.*

The lark and linnet sing with rival notes ;
They *strain* their warbling throats
To welcome in the spring. *Id.*

It is the worst sort of good husbandry for a father not to *strain* himself a little for his son's breeding. *Locke.*

Shave the goat's shaggy beard, lest thou too late
In vain shouldst seek a *strainer* to dispart
The husky terrene dregs from purer must. *Philips.*

In all pain there is a deformity by a solution of continuity, as in cutting ; or a tendency to solution, as in convulsions or *strains*. *Grew.*

See they suffer death ;
But in their deaths remember they are men,
Strain not the laws to make their torture grievous. *Addison.*

Turn then to Pharamond and Charlemagne,
And the long heroes of the Gallic *strain*. *Prior.*

These, when condensed, the airy region pours
On the dry earth in rain or gentle showers :
The insinuating drops sink through the sand,
And pass the porous *strainers* of the land. *Blackmore.*

Our words flow from us in a smooth continued stream, without those *strainings* of the voice, motions of the body, and majesty of the hand, which are so much celebrated in the orators of Greece and Rome.

Atterbury.

The stomach and intestines are the press, and the lacteal vessels the *strainers*, to separate the pure emulsion from its feces.

Arbutnot.

Their aliment ought to be light; rice boiled in whey, and *strained*.

Id. on Diet.

Your way is to wrest and *strain* some principles, maintained both by them and me, to a sense repugnant with their other known doctrines.

Waterland.

Macrobius speaks of Hippocrates' knowledge in very lofty *strains*.

Baker.

When the first bold vessel dared the seas,
High on the stern the Thracian raised his *strain*;

While Argo saw her kindred trees
Descend from Pelion to the main.

Pope's St. Cecilia.

Straining with too weak a wing,
We needs will write epistles to the king.
In our liturgy are as great *strains* of true sublime eloquence as are any where to be found in our language.

Pope.

Swift.

There can be no other meaning in this expression, however some may pretend to *strain* it.

Id.

Prudes decayed about may tack,
Strain their necks with looking back.

Id.

Strained to the root, the stooping forest pours
A rustling shower of yet untimely leaves.

Thomson.

A **STRAIN** is a pain occasioned by the violent extension of some membranous or tendinous part.

STRAIN and **STRESS**, in mechanics, are terms indiscriminately used to express the force which is excited in any part of a machine or structure of any kind tending to break it in that part. Thus every part of a rope is equally strained by the weight which it suspends. Every part of a pillar is equally strained by the load which it supports. A mill axle is equally twisted and strained in every part which lies between the part of the wheel actuated by the moving power, and the part which is resisted by the work to be performed. Every part of a lever or joist is differently strained by a force acting on a distant part. It is evident that we cannot make the structure fit for its purpose, unless the strength in every part be at least equal to the stress laid on, or the strain excited in that part. It is no less plain that if we are ignorant of the principles which determine this strain, both in intensity and direction, in relation to the magnitude and the situation of its remote cause, the only security we have for success is to give to every part of the assemblage such solidity that we can leave no doubt of its sufficiency. But daily experience shows us that this vague security is in many cases uncertain, if we are thus ignorant. In all cases it is slovenly, unlike an artist, attended with useless expense, and in machines is attended with a loss of power which is wasted in changing the motions of a needless load of matter. It must therefore greatly tend to the improvement of all professions occupied in the erection or employment of such structures to have a distinct notion of the strains to which their parts are exposed. Frequently, nay generally, these strains are not immediate, but arise from the action of forces on distant parts, by

which the assemblage is strained, and there is a tendency to rupture in every part. This strain is induced on every part, and is there modified by fixed mechanical laws. These it is our business to learn; but our chief object in this investigation is to determine the strength of materials which it is necessary to oppose in every part to this strain; and how to oppose this strength in such a manner that it shall be exerted to the best advantage. The notions of strain and strength, therefore, hardly admit of separation; for it is even by means of the strength of the intermediate parts that the strain is propagated to, or excited in, the part under consideration. See **STRENGTH**.

STRAINING is the clarification of a liquor, by passing it through a sieve or filter. The word is derived from the French *estreindre*; which is formed from *ex*, out of, and *stringere*, to press.

STRAIT, *adj.*, *n. s.*, & *v. a.* } Fr. *etroit* ;
STRAIT'EN, *v. a.* } Italian *stretto* ;
STRAIT'LACED, *adj.* } Latin *strictus*.
STRAIT'LY, *adv.* } Narrow; close;
STRAIT'NESS, *n. s.* } difficult; strict;
 intimate: used, though incorrectly, for direct, not crooked. A narrow pass, or frith; distress or difficulty: to *strait* or *straiten* is to put to difficulties; make narrow; contract; confine; make tight; distress: *straitlaced* is laced tight by stays: the adverb and noun substantive correspond with *strait* adjective.

Therefore hold I *strait* all thy commandments; and all false ways I utterly abhor.

Psalms. Common Prayer.

The city of Sidon has a secure haven, yet with something a dangerous entrance, *strained* on the north side by the sea-ruined wall of the mole.

Sandy's Journey.

He, forgetting all former injuries, had received that naughty Plexirtus into a *strait* degree of favour; his goodness being as apt to be deceived as the other's craft was to deceive.

Sidney.

Fugitives are not relieved by the profit of their lands in England; for there is a *straighter* order taken.

Spenser.

Plant garrisons to command the *streights* and narrow passages.

Id.

Those laws he *straitly* requireth to be observed without breach or blame.

Hooker.

The Saracens brought, together with their victories, their language and religion into all that coast of Africk, even from Egypt to the *streights* of Gibraltar.

Brewer on Language.

If your lass
 Interpretation should abuse, and call this
 Your lack of love or bounty, you were *strained*
 For a reply; at least, if you make care
 Of happy holding her. *Shakspeare. Winter's Tale.*

If his own life answer the *straightness* of his proceeding, it shall become him well.

Shakspeare.

He now, forsooth, takes on him to reform
 Some certain edicts, and some *strait* decrees
 That lay too heavy on the commonwealth. *Id.*

Proceed no *straiter* 'gainst our uncle Glo'ster,
 Than from the evidence of good esteem
 He be approved in practice culpable.

Id. Henry VI.

Honour travels in a *stright* so narrow,
 Where one but goes abreast.

Id. Troilus and Cressida

Waters when *straitened*, as in the falls of bridges, give a roaring noise. *Bacon's Natural History.*

It is a great error, and a narrowness or *straitness* of mind, if any man think that nations have nothing to do one with another, except there be an union in sovereignty, or a conjunction in pact. *Id. Holy War.*

The *straitness* of my conscience will not give me leave to swallow down such camels. *King Charles.*

Fretum Magellanicum, or Magellan's *straits.*

Abbot.

The *straitening* and confining the profession of the common law, must naturally extend and enlarge the jurisdiction of the chancery. *Clarendon.*

The independent party, which abhorred all motion towards peace, were in as great *straights* as the other how to carry on their designs. *Id.*

If this be our condition, thus to dwell

In narrow circuit, *straitened* by a foe
Subtle or violent. *Milton's Paradise Lost.*

Thyself

Bred up in poverty and *straights* at home,
Lost in a desert here, and hunger-bit.

Id. Paradise Regained.

Among the Romans, the laws of the twelve tables did exclude the females from inheriting; and had many other *straitnesses* and hardships, which were successively remedied. *Hale.*

Witnesses, like watches go,
Just as they're set, too fast or slow,
And, where in conscience they're *straight* laced,
'Tis ten to one that side is cast. *Hudibras.*

Stretch them at their length,
And pull the *streightened* cords with all your strength. *Dryden.*

'Tis hard with me, whatever choice I make,
I must not merit you, or must forsake:
But in this *straight* to honour I'll be true,
And leave my fortune to the gods and you. *Id.*

The landed man finds himself aggrieved by the falling of his rents, and the *streightening* of his fortune, whilst the monied man keeps up his gain. *Locke.*

Let nature have scope to fashion the body as she thinks best; we have few well-shaped that are *strait-laced*, or much tampered with. *Id. on Education.*

The *straitness* of the conveniencies of life amongst them had never reached so far as to the use of fire, till the Spaniards brought it amongst them. *Locke.*

Men, by continually striving and fighting to enlarge their bounds, and encroaching upon one another, seem to be *straitened* for want of room. *Ray.*

Kings reduced to *straights*, either by their own, or by the negligence of their predecessors, have been always involved in dark and mean intrigues. *Davenant.*

Some modern authors, observing what *straits* they have been put to in all ages to find out water enough for Noah's flood, say Noah's flood was not universal, but a national inundation. *Burnet's Theory.*

Let no man who owns a providence grow desperate under any calamity or *strait* whatsoever, but compose the anguish of his thoughts upon this one consideration, that he comprehends not those strange unaccountable methods by which providence may dispose of him. *South.*

The causes which *straiten* the British commerce, will enlarge the French. *Addison's State of the War.*

Several congregations find themselves very much *straitened*; and, if the mode increase, I wish it may not drive many ordinary women into meetings. *Id. Spectator.*

Cæsar sees

The *straights* to which you're driven, and, as he knows
Cato's high worth, is anxious for your life. *Addison.*

A bell or a cannon may be heard beyond a hill

which intercepts the sight of the sounding body; and sounds are propagated as readily through crooked pipes as through *straight* ones. *Newton's Opticks.*

Whatever *straitens* the vessels, so as the channels become more narrow, must heat; and therefore *strait* cloaths and cold baths heat. *Arbuthnot on Diet.*

Morality, by her false guardians drawn,
Chicane in furs, and casuistry in lawn,
Gasps, as they *straiten* at each end the cord,
And dies when Dulness gives her page the word. *Dunciad.*

Ulysses made use of the pretence of natural infirmity, to conceal the *straits* he was in at that time in his thoughts. *Brome.*

They are afraid to meet her, if they have missed the church; but then they are more afraid to see her if they are laced as *strait* as they can possibly be. *Lav.*

She watches their time of need and adversity, and, if she can discover that they are in great *straights* or affliction, she gives them speedy relief. *Id.*

STRAIT, a narrow channel or arm of the sea, shut up between lands on either side, and affording a passage out of one great sea into another. There are three kinds of straits. 1. Such as join one ocean to another. Of this kind are the straits of Magellan and Le Maire. 2. Those which join the ocean to a gulf; the straits of Gibraltar and Babelmandel are of this kind, the Mediterranean and Red Sea being only large gulfs. 3. Those which join one gulf to another; as the straits of Caffa, which join the Palus Mæotis to the Euxine or Black Sea. The passage of straits is commonly dangerous, on account of the rapidity and opposite motion of currents.

STRAKES, or STREAKS, in a ship, the uniform ranges of planks on the bottom and sides of a ship, or the continuation of planks joined to the ends of each other, and reaching from the stem to the stern-post and fashion-pieces; the lowest of these, which is called the starboard streak, is let into the keel below, and into the stem and stern-post. They say, also, that a ship heels a strake, that is, hangs or inclines to one side the quantity of a whole plank's breadth.

STRAKES, or STREKS, in mining, are frames of boards fixed on or in the ground, where they wash and dress the small ore in a little stream of water; hence called straked ore.

STRALSUND, one of the new governments of the Prussian states, including the part of Pomerania which belonged to Sweden in 1813, along with Rugen and other islands on the coast. It is almost entirely surrounded by water, the Baltic bounding it on the north, and the Peene, the Trebel, and the Recknitz, three rivers partly navigable, on the other sides. Its area is 1400 square miles; and it is much more fertile than the rest of Pomerania, having a heavy loam or black mould, producing fine crops of corn, rye, and pulse, as well as flax and tobacco. The pastures are not favorable for the larger cattle; but the number of sheep, hogs, and above all of geese is very considerable. Inhabitants about 115,000. See POMERANIA.

STRALSUND, a considerable town of Pomerania, long subject to Sweden, is situated on the strait which separates the island of Rugen from

the mainland; and is accessible only by bridges. It was a fortress of importance till 1807. Its harbour is capacious and safe, admitting ships of fifteen feet draught. The houses are low, but built of brick, and remarkable for being pointed at the top: the streets narrow, and indifferently paved. There are four Protestant and one Catholic church. The other public buildings are the government-house, town-house, mint, arsenal, and governor's house. Of public institutions, the chief are the academy or gymnasium, the orphan-house, the poor-house, the lunatic hospital, and the public library. The environs are flat and sandy, and the water is raised by a hydraulic machine. The manufactures comprise woollens, linen, tobacco, soap, glass: breweries and distilleries. Stralsund was a member of the Hanseatic league, and has long been a place of trade. Of corn, its principal export, there is sometimes shipped between 30,000 and 40,000 quarters. The imports consist chiefly of colonial produce and foreign manufactures; and the building of ships and boats form a considerable branch of trade. The town has suffered much at different times by sieges, but has always recovered, in consequence chiefly of its trade. Population 12,000. Ninety miles N. N. W. of Stettin. Long. 30° 32' E., lat. 54° 19' N.

STRAMONIUM. See DATURA.

STRAND, *n. s. & v. a.* Sax. *strān*; Goth. and Swed. *strand*; Belg. *strande*; Isl. *strand*; Teut. *strande*. The verge of the sea, or of any water: to drive or force into shallow water.

I saw sweet beauty in her face;
Such as the daughter of Agenor had,
That made great Jove to humble him to her hand,
When with his knees he kissed the Cretan *strand*.
Shakspeare.

Tarchen's alone was lost, and *stranded* stood,
Stuck on a bank, and beaten by the flood.
Dryden's Æneid.

Some from the *stranded* vessel force their way,
Fearful of fate, they meet it in the sea;
Some, who escape the fury of the wave,
Sicken on earth, and sink into a grave. *Prior.*

Some wretched lines from this neglected hand
May find my hero on the foreign *strand*,
Warmed with new fires. *Id.*

I have seen of both those kinds from the sea, but
so few that they can only be such as have strayed
from their main residence, and been accidentally in-
tercepted and *stranded* by great storms.

Woodward on Fossils.

STRANGE, *adj., interj., &* Fr. *étrange*;
STRANGE^{LY}, *adv.* [v. n.] Latin *extraneus*.
STRANGE^{NESS}, *n. s.* Foreign; of an-
STRAN^{GER}, *n. s. & v. a.* } other country;
odd; wonderful; irregular; new; remote; un-
acquainted; surprising! (an expression of wonder):
to strange (an obsolete barbarism) is, to wonder;
be astonished: the adverb and noun substantives
correspond with the adjective: to stranger is used
by Shakspeare for to estrange; alienate.

Joseph saw his brethren, but made himself *strange*
unto them. *Genesis* lxii. 7.

I do not contemn the knowledge of *strange* and
divers tongues. *Ascham's Schoolmaster.*

Long custom had inured them to the former kind
alone, by which the latter was new and *strange* in
their ears. *Hooker.*

Desire my man's abode, where I did leave him:
He's *strange* and peevish. *Shakspeare. Cymbeline.*
She makes it *strange*, but she would be best
pleased

To be so angered with another letter. *Shakspeare.*
As by *strange* fortune

It came to us, I do in justice charge thee
That thou commend it *strangely* to some place,
Where chance may nurse or end it.

Id. Winter's Tale.

Will you not observe
The *strangeness* of his altered countenance?

Id. Henry VI.

I am a most poor woman, and a *stranger*,
Born out of your dominions; having here
No judge indifferent. *Id. Henry VIII.*

Strangers and foes do sunder, and not kiss.
Shakspeare.

My child is yet a *stranger* in the world,
She hath not seen the change of fourteen years.
Id.

Will you, with those infirmities she owes,
Dowered with our curse, and *strangered* with our
oath,

Take her or leave her? *Id.*

Men worthier than himself
Here tend the savage *strangeness* he puts on;
And undergo, in an observing kind,
His humorous predominance.

Id. Troilus and Cressida.

If a man, for curiosity or *strangeness* sake, would
make a puppet pronounce a word, let him consider
the motion of the instruments of voice, and the like
sounds made in inanimate bodies.

Bacon's Natural History.

It is evident, and it is one of the *strangest* secrets
in sounds, that the whole sound is not in the whole
air only, but is also in every small part of the air.
Id.

The natural subjects of the state should bear a
sufficient proportion to the *strange* subjects that they
govern. *Bacon.*

We ought to acknowledge that no nations are
wholly aliens and *strangers* the one to the other. *Id.*

In this peace there was an article that no English-
man should enter into Scotland, and no Scottishman
into England, without letters commendatory: this
might seem a means to continue a *strangeness* be-
tween the nations; but it was done to lock in the
borderers. *Id.*

As the man loves least at home to be,
That hath a sluttish house, haunted with sprites:

So she, impatient her own faults to see,
Turns from herself, and in *strange* things delights.
DuVivier.

A *strange* proud return you may think I make you,
madam, when I tell you it is not from every body I
would be thus obliged. *Suckling.*

Thus the *strange* cure to our spilt blood applied,
Sympathy to the distant wound does guide. *Cowley.*

Here passion first I felt,
Commotion *strange*!
Milton.

He will vouchsafe
This day to be our guest: bring forth and pour
Abundance, fit to honour and receive
Our heavenly *stranger*. *Id.*

Were all the assertions of Aristotle such as theology
pronounceth impieties, which we *strange* not at from
one of whom a father saith, Nec Deum coluit, nec
curavit. *Glauville.*

His perusal of the writings of his friends and
strangers. *Fell.*

Strange! what extremes should thus preserve the
snow
High on the Alps, or in deep caves below. *Waller.*

This made David to admire the law of God at that *strange* rate, and to advance the knowledge of it above all other knowledge. *Tillotson.*

How *strangely* active are the arts of peace, Whose restless motions less than wars do spread; Peace is not freed from labour, but from noise; And war more force, but not more pains, employs. *Dryden.*

Strange to relate! from young Iulus' head A flambent flame arose, which gently spread Around his brows, and on his temples fed.

Id. Æneid.

I was no *stranger* to the original: I had also studied Virgil's design, and his disposition of it.

Dryden.

Strange! that fatherly authority should be the only original of government, and yet all mankind not know it. *Locke.*

We should carry along with us some of those virtuous qualities, which we were *strangely* careless if we did not bring from home with us.

Sprat's Sermons.

If I will obey the gospel, no distance of place, no *strangeness* of country, can make any man a *stranger* to me. *Sprat.*

This raised greater tumults and boilings in the hearts of men, than the *strangeness* and seeming unreasonableness of all the former articles. *South.*

There is no place in Europe so much frequented by *strangers*, whether they are such as come out of curiosity, or such who are obliged to attend the court of Rome. *Addison on Italy.*

In a time of affliction, the remembrance of our good deeds will *strangely* cheer and support our spirits.

Calamy.

Melons on beds of ice are taught to bear; And *strangers* to the sun yet ripen here. *Granville.*
They came, and near him placed the *stranger* guest.

Pope.

After a year's interregnum from the death of Romulus, the senate of their own authority chose a successor, and a *stranger*, merely upon the fame of his virtues. *Suift.*

It would *strangely* delight you to see with what spirit he converses, with what tenderness he reproves, with what affection he exhorts, and with what vigour he preaches. *Law.*

Thus the majestick mother of mankind, To her own charms most amiably blind, On the green margin innocently stood, And gazed indulgent on the crystal flood; Surveyed the *stranger* in the painted wave, And, smiling, praised the beauties which she gave.

Young.

How *strangely* crowds misplace things and miscal! Madness in one is liberty in all. *Harte.*

STRANGE (Sir Robert), who carried the art of engraving to so great perfection in this country, was a man of general merit. His works will perpetuate his name whilst any taste for the fine arts remains. He was born in the island of Pomona, in Orkney, 14th of July, 1721. He was descended from the Stranges or Strangs of Balcasky, in Fife, who settled in Orkney at the time of the reformation. He received his classical education at Kirkwall in Orkney, under Mr. Murdoch Mackenzie, who has rendered infinite service to his country by the accurate surveys and charts he has given of the islands of Orkney and of the British and Irish coasts. Mr. Strange was intended for the law, but soon perceived that his genius led him to drawing and engraving. For this purpose he was introduced to

the late Mr. Richard Cooper at Edinburgh, the only person there who had then any taste in that line. He was bound with him as an apprentice for six years, during which time he made rapid progress. In 1747 he married Isabella, only daughter of William Lumisden, son of bishop Lumisden; and soon after went to Paris, where he prosecuted his studies under the celebrated Le Bas, from whom he had the first hint of the dry needle; which he afterwards greatly improved by his own genius, and which has added such superior beauties to his engravings. In 1751 he removed with his family from Edinburgh and settled at London, where he engraved several fine historical prints, which acquired him great reputation. At this period historical engraving had made little progress in Britain, and he may properly be considered as its founder. In 1760 he went to Italy, where he made many admirable drawings, several of which he afterwards engraved. These are now in the possession of lord Dundas. Every where in Italy singular marks of attention were bestowed on Mr. Strange, by great personages, and by the principal academies in that country. He was made a member of the academies of Rome, Florence, and Bologna, and professor in the royal academy at Parma. The ceiling of the Vatican library, at Rome, in which the collection of engravings are kept, is elegantly painted by Signior Rotfanelli. It represents the progress of engraving; and the portraits of the most eminent artists in that line are there introduced, among which is that of our artist. He is the only British artist on whom this honor has been conferred. In France, where he resided many years, he was made a member of the Royal Academy of Painting at Paris. King George III., ever attentive to the progress of the fine arts, as a mark of his royal approbation of the merit of Mr. Strange, conferred the honor of knighthood on him the 5th of January 1787. Sir Robert Strange was no less distinguished by his amiable moral qualities. He left fifty capital plates, which are carefully preserved in his family, engraved from pictures by the most celebrated painters of Italy. From his earliest establishment, Sir Robert preserved about eighty copies of the finest and choicest impressions of each plate he engraved; which, from length of time, have acquired a high degree of beauty. These he arranged in the order in which they were engraved. To each volume he prefixed two portraits of himself, the one an etching, the other a finished proof, from a drawing by John Baptiste Greuse. Each volume, besides a dedication to the king, contains an introduction on the progress of engraving, and critical remarks on the pictures from which his engravings are taken. These volumes were ready to be given to the public, when Sir Robert's death and consequent circumstances delayed this magnificent publication; a publication which does honor to the artist, and to the country which gave him birth. He died at London, July 5th 1792.

STRANGEA, a secondary ridge of mountains, branching off from the Hæmus chain on the south, and extending along the Black Sea to the Thracian Bosphorus. An inferior branch, called

Mount Tekis, becomes detached from this, and stretches partly in a south-west direction to the point of the Chersonesus, partly in a circular form, round the gulf of En.

STRANGER, in law, denotes a person who is not privy or party to an act. Thus a stranger to a judgment is he to whom a judgment does not belong; in which sense the word stands directly opposed to party or privy.

STRANGLE, *v. a.* } Fr. *etranger*; Lat. }
 STRAN'GLER, *n. s.* } *strangulo*. To choak;
 STRANGULA'TION. } suffocate; kill by intercepting the breath; suppress: both the noun substantives corresponding.

The lion did tear in pieces enough for his whelps, and *strangled* for his lionesses, and filled his holes with prey. *Neheemiah.*

Dost thou not know that thou hast *strangled* thine husbands? *Tobit* iii. 8.

His face is black and full of blood;
 His eye-balls farther out than when he lived,
 Staring full ghastly, like a *strangled* man.

Shakspeare. Henry VI.
 By the' clock, 'tis day;
 And yet dark night *strangles* the travelling lamp:
 Is 't night's predominance, or the day's shame?

Id. Macbeth.
 The band that seems to tie their friendship together will be the very *strangler* of their amity.

Id. Antony and Cleopatra.
 A sponge is mischievous, not in itself, for its power is harmless; but because, being received into the stomach, it swelleth, and, occasioning its continual distension, induceth a *strangulation*.

Browne's Vulgar Errors.
 So heinous a crime was the sin of adultery, that our Saxon ancestors compelled the adulteress to *strangle* herself; and he who debauched her was to be hanged over her grave. *Ayliffe.*

The reduction of the jaws is difficult; and, if they be not timely reduced, there happen paralysis and *strangulation*. *Wismann.*

STRANGLES, in veterinary science. The French and other foreign writers have compared the strangles in horses to the small-pox in men; and, as the small-pox is more incident to children than to grown persons, so it has been observed, by these writers, that the strangles chiefly affect colts and young horses, when they catch inveterate colds; which is very true, for horses are seldom subject to the strangles after six years old, though Gibson speaks of some horses that he knew to have had this distemper at seven and eight, and sometimes at nine or ten, though these instances, he says, are not very common. The strangles are also said to resemble the small-pox in this, that the disease never seizes horses oftener than once; whereas many other distempers, proceeding from common causes and accidents, will return as often as there are the proper causes to produce them. But, however this be, it is probable that the strangles are a critical swelling, which, when it suppurates and breaks, discharges somewhat obnoxious to the constitutions of young horses, as they are usually rendered more healthful than they were before.

This disease begins with a swelling between the jaw-bones, sometimes pretty low among the muscles of the tongue, attended with great heat, pain, and inflammation, sometimes to such a degree that a horse is scarcely able to swallow till

the tumor suppurates. Many colts have the strangles at grass, and the tumor comes to maturity and breaks, yielding a very plentiful discharge, without any other help than what nature affords; though in some cases there is very great malignity, with a purulent running at the nose, which is often dangerous. Those colts, however, that escape the strangles at grass, are liable, for the most part, to be seized when they are first taken up and put to business; and we often observe the change of diet, an alteration in the air, &c., bring on the strangles. Other causes may be, their catching cold, shedding their teeth, or whatever may induce pain, or bring on irritation at any critical time upon the throat and jaws.

When the strangles are coming upon a horse, he feels unusually hot, and sometimes very feverish, with a painful cough; some go quite off their stomachs, others are only dainty, or eat and drink with pain in chewing and swallowing. When the swelling begins on the inside of the jaw-bone, it is much longer in coming to maturity than when it begins more towards the middle. When the skin is tight and much stretched over the swelling, and that feels unusually dry and hot, the swelling will in that case be large before it breaks, and yield a plentiful discharge. When the swelling of the strangles rises between the jaw-bones, under the middle of the tongue, it is always the most favorable; but if it rises upwards among the glands, and is divided into several little tumors, it is not so kindly, but is apt to break in several places and at different times before it sinks, which renders the case more tedious and troublesome.

When the strangles begin directly in the upper part of the throat, towards the head of the wind-pipe and gullet, they hinder a horse sometimes from swallowing for several days, until the tumor grows full and large on the outside. This degree of the strangles is not altogether without danger of suffocation. The pressure made upon the head of the wind-pipe makes the horse's eye look fixed, as if he was convulsed, with his nose turned outwards, and his nostrils open for want of breath; which symptom continues till the tumor, growing ripe, breaks and runs off. But the worst and most dangerous kind of strangles is, when, at the same time that a horse is swelled under the jaws, he runs also at the nose, which Gibson attributes either to some constitutional malignity, or to bad management; and this is what some call the false or bastard strangles.

This disease seldom proves dangerous, unless the efforts of nature are interrupted. Doing much in this case, says Gibson, is worse than doing too little, for the strangles seldom need any other help than to assist suppuration, by keeping the swelling always moist with camphorated hog's lard. Some apply poultices to the strangles; but, besides the trouble of applying them, and renewing them often, they frequently prove hurtful, by being composed of materials that are too stimulating, as turpentine, &c. Besides, if the poultices be not kept close, they are apt to chill the part, and to repel rather than promote a discharge of the humors, and this often leaves a dry and obstinate cough, or endangers the horse's eyes. Another error, in the cure of the strangles

is opening the tumor before it comes to maturity, which defeats the purpose of nature; for there are found in that case callous swellings under the throat, with a gleeing ulcer, sometimes followed by a plentiful running at the nose, which, without very great care, will end in the glanders.

If the strangles begin with great pain and inflammation, as sometimes happens; if the horse's eyes be fixed, and he look convulsed; his neck much swoln, and his jaws stiff, with his nose turned outwards; it is necessary to take away a sufficient quantity of blood, to foment and apply a bran poultice to the part, covering it with a thin woollen cloth; and this should be persevered in till it comes to maturity and breaks. Sometimes the inflammation is so great as to destroy the skin that encloses the matter, by which means it falls off in pieces, like an eschar made by a caustic, and exposes the interstices of the muscles and contiguous glands. But here also nature will effect a cure, without any other help besides what has been already recommended; for the cavity is soon filled by a new growth of flesh, and covered with skin and hair, as perfect as at first. Sometimes the strangles break inwardly, and the matter is discharged chiefly by the mouth; and, when it is so, the horse's mouth may be washed once or twice a day, with equal parts of brandy and vinegar, with a spoonful of honey to each pint. This, with warm soft diet, will perfect the cure without any other help, and the swelling on the outside will soon wear off.

In some cases, where there is little swelling and inflammation, the horse will eat and drink without pain; and though there be a collection of matter, yet, when it is small, it sometimes continues long without breaking. When matter is formed in this way, and may be felt by gentle pressure with the finger, Mr. Denny advises to open the tumor with a lancet in the most depending part.

STRANRAER, or STRANRAWER, a royal burgh of considerable antiquity in Wigtonshire, at the head of the bay of Loch-Ryan, fifty miles south of Ayr, and nine and three-quarters north of Glenluce. It is the seat of a Presbytery, and the chief town of the district of the Rinns. The principal street is of considerable length: the greatest part of the houses are old, and built on no regular plan; but whole streets of elegant houses have lately been built, and a handsome town-house and prison. It is a port of the custom-house; and has some trade to the Baltic, Ireland, and England; chiefly in the exportation of grain. The cotton and linen manufactures are carried on to a considerable extent. Here is also a considerable tan-work. The harbor of Stranraer is excellent, being sheltered on all sides, and lying at the head of Loch-Eyan, which affords excellent anchorage. Stranraer is governed by a provost, two bailies, a dean of guild, and fifteen councillors; and unites with Wigton, New-Galloway, and Whithorn, in sending a member to parliament. Near the town is the old castle of Culhorn, and not far from it is the castle of Culhorn, the beautiful residence of that noble family.

STRAP, *n. s.* } Belg. *stroppe*; Ital. *stroppa*.
STRAPPA'DO. } Lat. *struppus*. A narrow long slip of cloth or leather: chastisement by a strap.

These clothes are good enough to drink in, and so be those boots too; and they be not, let them hang themselves in their own straps

Shakspeare. Twelfth Night.

Were I at the strappado, or all the racks in the world, I would not tell you on compulsion.

Shakspeare.

I found but one husband, a lively cobbler, that kicked and spurred all the while his wife was carrying him on; and had scarce passed a day without giving her the discipline of the strap. *Addison's Spectator.*

STRAP, among surgeons, a sort of band used to stretch out limbs in the setting of broken or disjunct bones.

STRAP, in a ship, the rope which is spliced about any block, and made with an eye to fasten it any where on occasion.

STRAPS, in the manege. The straps of a saddle are small leather straps, nailed to the bows of the saddle, with which we make the girths fast to the saddle.

STRAPPADO, or STRAPADO, is a barbarous military punishment, wherein the criminal's hands being tied behind him, he is hoisted up with a rope to the top of a long piece of wood, and let fall again almost to the ground; so that, by the weight of his body in the shock, his arms are dislocated. Sometimes he is to undergo three strap-padoes or more.

STRASBURG, a large city of Alsace, France, situated at the influx of the Brusche into the Ille, and about half a mile from the Rhine. Its form is semicircular; and it is divided into several parts by canals, over which there is a number of bridges. The construction of the houses is after the German manner, Alsace having belonged to France only since the latter part of the seventeenth century, and the language and customs of the majority of the inhabitants are still German. The material employed for building is a red stone found in the quarries of the neighbourhood. The houses are lofty but heavy: of the streets, the one called La Grande rue, and a few others, are wide and straight, but the far greater part are narrow. The place d'armes is a square, surrounded with good buildings. It is frequented as a public walk; but the more extensive promenades are the Contadin, adjacent to the city walls; and the Ruptborshant, a fine meadow, divided into a number of alleys bordered with trees. The fortifications are extensive: being divided into old and new, the former only repaired by Vauban, the latter entirely constructed by him. The citadel lies towards the east. It is a regular pentagon, composed of five bastions, and as many half-moons, and with out-works extending almost to the Rhine.

The cathedral of Strasburg is justly classed among the most distinguished specimens of Gothic architecture. Its tower, 470 feet in height, is ascended by a stair of above 700 steps, and is said to be the loftiest building in the world, with the exception of the great pyramid of Egypt. It is built of hewn stone, cut with such nicety as to give it at a distance some resemblance to lace. It was upwards of a century and a half in building. Of the other churches, the only one worth notice is that of St. Thomas, containing the monument erected by Louis XV. to marshal Saxe. The town-hall, a large structure, has its façade ornamented with antique paintings. The episcope

pal palace is a good modern building, and the theatre handsome and spacious. Here are two hospitals, one for the military, the other for the lower classes, both extensive and well regulated. Here is also a foundling hospital and an orphan-house; an artillery school, cannon-foundry, and arsenal; to which may be added, a telegraph station, a monument to general Desaix, and the wooden bridge over the Rhine, of the length of 3900 feet.

Strasburg is well situated for trade, the fertile soil of Alsace furnishing the means of subsistence to manufacturers, and the Rhine connecting it with Switzerland and the Netherlands. Its articles for export consist of corn, flax, hemp, wine, spirituous liquors; also of linen, sailcloth, blankets, carpets, hardware, leather, cotton, and lace. Tobacco is a product of Alsace; and snuff is consequently an object of manufacture here. The medical school of Strasburg, after being long an academy, was constituted a university in the seventeenth century, and, though curtailed in its classes during the French revolution, was replaced on its former footing in 1803. In that year also was established a Protestant university, taught by ten professors, and comprising a classical, philosophical, and theological course. The only other Protestant university (or, as they are here termed, academies) in France is Montauban. Strasburg also contains a law school; two public libraries of old date; and a botanic garden. For boys there is here a high school, on the plan of those of Rouen, Caen, and other large towns.

Strasburg existed prior to the Christian era, having been known to the Romans by the name of Argentoratum. It early received the Reformation, and is said to have counted among its inhabitants a majority of Protestants until the latter part of the seventeenth century. Till then it had held the rank of a free city of the empire. At present the proportion of Catholics exceeds that of Protestants: the town is the see of a bishop and the residence of a prefect. This town and its vicinity has been more than once the scene of modern warfare. In 1798, when the French revolutionists were pressed by the Austrians; in the early part of the summer 1796, when the former crossed the Rhine for the invasion of Germany; and, finally, in the autumn of that year, when the French being expelled from Franconia, Kehl, with its bridge leading to Strasburg, had very nearly fallen into the hands of their opponents. In the invasions of 1814 and 1815 Strasburg escaped attack. Sixty-six miles north of Bale, seventy-five east of Nancy, and 290 east of Paris.

STRATA, in mineralogy, the several beds or layers of different matters whereof the earth is composed. See QUARRY, GEOLOGY, and MINERALOGY.

STRATAGEM, *n. s.* Fr. *stratageme*; Gr. *στρατηγία*. An artifice; a trick by which an enemy is deceived.

Every minute now

Should be the father of some stratagem.

Id. Henry IV.

Rouse up your courage, call up all your counsels,
And think on all those stratagems which nature

Keeps ready to encounter sudden dangers.

Denham's Sophy.

Those oft are stratagems which errors seem;
Nor is it Homer nods, but we who dream. *Pope.*

STRATAGEMS, in the art of war, certain feints which are resorted to by able generals, &c., to cover their real designs during the operations of a campaign. Stratagems were much practised by the ancients; the moderns wage war more openly, and on the square. Frontinus has made a collection of the ancient stratagems of war. It is impossible to lay down any specific rules on this head, as every general, according to the capacity and activity of his mind, makes use of the various means and expedients which grow out of times, circumstances, and occasions. It has been asserted by some writers that all sorts of stratagems (even those which are connected with treachery) may be adopted for the accomplishment of any design. This maxim is, however, strongly combated against by those who have written upon the law of nations. Probity, in fact, and elevation of mind (which are superior to the pitiful measures of treacherous affiliation or intercourse) should always bear the ascendancy in human actions. There are stratagems which may be practised and carried on without the least deviation from honor and good faith. Many distinguished generals have had recourse to these; but none ever succeeded so well as Hannibal. Wishing to cross the river Rhone, and being in want of almost every article that was necessary to effect the passage in the presence of an enemy who was diligently watching his motions, he caused him to imagine that it was his intention to keep the ground he occupied. He ordered large fires to be lighted up in different quarters of his camp, and directed some of his troops to shout and make loud noises as if they were perfectly stationary. During this apparent state of inactivity he broke up his camp, marched along the river's side, and crossed it at a place where it was least expected he would make the attempt. Among other good qualities, which are indispensably necessary in an able general, that of knowing how to conceal a projected march, and to anticipate the motions of an enemy, is not the least important.

The army under the command of the duke of Saxe Weimar, having laid siege to Brissack in 1638, the imperialists went to the relief of that place. The duke, on receiving intelligence of their approach, instantly marched against them with a body of forces composed of Swedes and French allies. The imperialists, who had advanced by rapid marches, had gained possession of an eminence, by means of which they would have enjoyed all the advantages of local superiority, had not the count de Guébriant, who was then a lieutenant-general in the Swedish service, suggested a stratagem to dislodge the enemy. The following plan was consequently adopted, and it succeeded to the full extent of his design:—The drums and trumpets of the different corps were collected together and stationed in a neighbouring wood, so as to draw the enemy's force and attention from the quarter proposed to be carried. The imperialists being naturally led to believe, from the noise and concurrence of so many military instruments, that they were going to be attacked from that quarter, beat to arms,

and left their position in complete order of battle. They had scarcely quitted the eminence before the duke of Saxe Weimar appeared in their rear, took possession of the ground which they had so imprudently abandoned, and became master of all the advantages which his enemy would otherwise have enjoyed. An interesting account of this ingenious manœuvre may be found in the History of Le Maréchal de Guébriant.

Stratagems of this description have been frequently used by the French during the late war, particularly in Italy. Stratagems, in fact, constitute one of the principal branches in the art of war. They have been practised in all ages by the most able generals, and have contributed, in a great degree, to their military reputation. Virgil, in his *Aeneid*, book ii. says,

Dolus an virtus quis in hoste requirat.

The history of France abounds with instances in which stratagems of every kind have been successfully practised. It seems the peculiar talent of the inhabitants of that country to derive advantages from well concerted feints, &c., in war, and to secure their victories more by science than by downright hardihood. Nevertheless far be it from us to detract from the latter. Modern Frenchmen, as soldiers, seem to have acquired, or to have had awakened in them, on shore, the courage and perseverance which are so remarkably conspicuous amongst us at sea. Perhaps it is out of the natural course of things that they should ever reach the naval excellence by which this country is so singularly distinguished; and perhaps it is equally ordained that we should never be the first in military knowledge. France and England unquestionably hold between them the destinies of Europe, and of the three other quarters of the globe: France by the natural advantages of her continental position, added to a predilection for arms which is manifest throughout her population; and England by its insular situation, rendered, as it were, impregnable by an innate courage, and unrivalled aptitude at sea. Time alone, and the experience of facts, must hereafter determine how far either nation will be benefited by a deviation from the primary advantages which nature furnishes to each. For it must be acknowledged that the true element in which a Frenchman seems calculated to act is on shore, or within the guardian range of his artillery and fire-arms; and that an Englishman, though far from being wholly out of his element on land service, is thoroughly himself at sea. From the increase of our foreign possessions, but most especially from the extent of our territories in India, and the armed state of Europe, it has been found expedient to enlarge the scale of our military establishments, in proportion to the exigencies of a very desultory service abroad, and a possible necessity at home for military operations. Without, therefore, entering into the policy of either country, we shall content ourselves with observing that, as we have an army, it behoves every efficient character belonging to that army to obtain a thorough knowledge of his profession, and to study the nice shades of an art which, of all others, has principles that are fixed and im-

mutable, under circumstances of the greatest apparent casualty. It has been wisely observed by a French writer, under the article of *Stratagèmes de Guerre*, that a chief, who is defeated in a general action, will sometimes attribute his failure to fortune, although it be universally acknowledged that chance, or fortune, has a very trifling share in pitched battles, while art and science regulate the different movements, and finally determine their issue. Whoever, therefore, suffers himself to be surprised by his enemy cannot be said to stand wholly exculpated from ignorance, or neglect, since it must have been in his power to have avoided the snares laid for him, by means of vigilant spies and unremitting attention. This remark appears to us not only to be generally correct, but it seems more immediately applicable to all generals that have secret service money at command. The influence of that commodity (upon which no embargo can be laid) will be felt in every garrison town, or sea-port; and those who have the management of the public purse must be dull indeed if they do not feel their way into the secret preparations of an enemy, before they hazard an attack against him. Of a deficiency on this ground we have had melancholy proofs both in Spain and Holland, particularly at Walcheren in 1809.

Besides the different stratagems, says major James, which may be used by an able general, to bring about the overthrow of the whole or part of an army, by leading it into an ambuscade, there are various ones which may be practised against a fortified place. To effect the latter purpose you may contrive to get soldiers in disguise through the gates at unguarded hours; to introduce them through subterraneous passages, or by any other means that may offer. Before any attempt of this sort is made, every part of the fortifications should be narrowly reconnoitred, and as much knowledge be obtained of the interior situation of the place as can be procured by means of good spies, or from deserters. You must, above all things, be well assured that the garrison is relaxed in duty; that the different guards are negligently attended to; that the soldiers who compose them are in the habits of drinking or gaming; that their officers neglect their rounds, or go them without system or regularity; that the gates are ill guarded, and the avenues to them ill watched; and that there are certain places, or entrances, which are not watched at all; for it is almost impossible to surprise any place that has been regularly fortified while the garrison does its duty. If it should appear practicable to surprise a town, by taking advantage of the negligence of the sentries, &c., at some particular gate, previous means must be adopted to introduce some soldiers dressed like market women, or in the garb of some religious order. You may then contrive to get a waggon or cart (seemingly loaded with hay or straw, but with soldiers concealed beneath it) so placed in the entrance of the gate that it will serve as an obstacle when it may be found necessary to shut it. In order to do this effectually, let a pin be taken out, so that the wheel comes off, or the axle-tree gets broken. The instant this is done the soldiers, who had entered the town in disguise, must

join the drivers, the men that have been concealed in the waggon will then leap out, and the whole must rush upon the port-guard. While this happens the troops that have been placed in ambush round the fortifications will advance with promptitude and firmness, and endeavour to get possession of the town before a sufficient force can be collected to repel the attack. In the year 1789 a rabble from Courtray took advantage of the carelessness of the imperial troops, who were in garrison at Gand, in Flanders, and by seizing upon the gate and port-guard brought about a temporary rebellion in the country. The author of this compilation was an eye-witness to the consequent effects of this coup de main; and he is fully persuaded that Antwerp might have been taken in 1809 by a prompt and vigorous approach. This, indeed, was done without stratagem; but the circumstance proves that, when the sentries of a fortified place are negligent in their duty, a surprise is always practicable. We are precluded, by the limits of our undertaking, from going more fully into this important branch of military science. Several treatises have been written on the subject. Among others one appeared in 1756, entitled *Stratagemmes de Guerre*, illustrating, from history, the various stratagems which had been practised by some of the ablest generals, during a long period of time, down to the peace of Aix-la-Chapelle. It was published by Mr. Carlet de la Rosière, an officer in the French service, and acting engineer in the isles of France and Bourbon. It contains much curious matter.

STRATARITHMOMETRY, in war, the art of drawing up an army, or any part of it, in any given geometrical figure; and of expressing the number of men contained in such a figure, as they stand in order of battle, either at hand or at any distance assigned.

STRATEGICS and **TACTICS**. Mr. C. Malorti de Martemont, in his translation of a work entitled the *Modern System of War*, has defined these terms in the following manner:—‘I define strategies, the science of the movements in war of two armies, out of the visual circle of each other; or, if better liked, out of cannon reach. Tactics are the science of the movements made within sight of the enemy, and within reach of his artillery. The reader may, if he pleases, prefer the reach of cannon to that of sight for the bounds within which the movements of war cease to be strategies and become tactics. But were I to decide for one of them I should adopt the reach of sight, for the following reason: that deploying columns in order of battle is an operation of tactics; yet it is generally done out of cannon reach. At Rosbach, to be sure, it was not so, but what was the consequence?’ p. 87.

STRATEGUS (*στρατηγος*), in antiquity, an officer among the Athenians, whereof there were two chosen yearly, to command the troops of the state. Plutarch says there was one chosen from out of each tribe; but Pollux seems to say they were chosen indifferently out of the people. The people themselves made the choice, and that on the last day of the year in the Pnyx. The two strategi did not command together, but took their turns day by day, as we find from Herodotus and

Cornelius Nepos. Sometimes, indeed, as when a person was found of merit vastly superior and exceedingly famed in war, the command was given to him alone: but it was ever a rule not to put any person in the office but whose estate was in Attica, and who had children, that there might be some hostages and securities for his conduct and fidelity. Constantine the Great, besides many other privileges granted to the city of Athens, honored its chief magistrate with the title of *Μεγας Στρατηγος*, *Magnus Dux*.

STRATEGY. Strategy differs materially from tactic; the latter belonging only to the mechanical movement of bodies set in motion by the former. One is, in fact, the soul, the other the mere body of military science. In a most excellent publication, entitled *Idées Raisonnées sur un Système Général, &c., pour étudier la Science de la Guerre, &c.*, by Nockhern de Schorn, we find the following explanation of the term; and, as it does not exist in any of our English lexicographers, we presume the extract must be particularly gratifying to the intelligent officer. In page 198, *Troisième Partie, Sixième Chapitre, Sixième table Méthodique*, our author thus continues:—‘We are at length got to the sixth integral part of military knowledge, which is termed *stratégie*, or the art of knowing how to command, and how to conduct the different operations of war: the word is derived from the Greek *strategos*, which signifies chief or general of the army. The term general or chief conveys the same meaning, indeed, that constitutes the word universal, and points out an officer of superior rank whose mind is well stored with military theory, and who can practically lead into active service all the different arms, or component bodies belonging to war; such as cavalry, infantry, and artillery. This definition clearly points out the impropriety of confining the terms general, lieutenant-general, and major-general, to any particular body of armed men: for what is a general whose skill consists in being able to manage a body of cavalry, or of infantry only, without knowing how to conduct others? A general, whether he be commander-in-chief, or be acting in a subordinate capacity to him, ought to know cavalry, infantry, and artillery movements, and possess all the branches of military science. Nor are these observations confined to the generals and superior officers of armies; subaltern officers should be more or less versed in the science of knowing how to conduct men into action, and to combine the different operations of war; particularly so if their natural ambition should lead them to aspire to the highest posts of military preference.’

‘Strategy, or the knowledge of commanding armies, may be divided into two parts; one comprehending the higher, and the other embracing the lower branches of the art. The first embraces all that a commander-in-chief, and all that his subordinate generals, should be acquainted with; and the second (which may also be called *la petite guerre*, being the diminutive of the first) appertains to the staff, and to a certain proportion of subaltern officers. To be adequate to a chief command it is necessary that the person, so selected, should possess extraordinary talents, and

not only be master of all the theory of war, but likewise know, from practice and experience, every species of military operation. He should, in fact, to refer to one of our own articles (*vide* *MIND*) be gifted with a military mind.

In order to obtain all that can be obtained by study (for natural genius must supply a very large proportion) the intelligent officer will first fix upon a distinct and clear idea of the part he means to investigate. From one idea he will gradually proceed to another; and, when the whole system has thus been progressively touched upon, he will take an analytical view of the several component parts; examine them together; weigh their relative points, and then look into the different authors that have written upon this vast and complicated subject. He will peruse what relates to the first branch, or *La Grande Stratégie*, in the following works:—1. *Les Mémoires de Montécuculi*. 2. *L'Esprit de Fofard*. 3. *Art de la Guerre, par le Maréchal de Puiségur*. 4. *Les Rêveries du Maréchal de Saxe*. 5. *L'Essai sur l'Etat de la Guerre, par Turpin*. 6. *Les Instructions du Roi de Prusse*. 7. *Le Cours et le Traité de Tactique, par Joly de Mézeroy*. 8. *Théorie de la Guerre, par le même*. 9. *Pensées sur la Tactique et la Stratégie, par M. de Sylva*. 10. *L'Essai Général de Tactique, par M. Guibert*.

The best writings on what is called *La Petite Stratégie*, or the inferior branches of the art of war, are, 1. *Le Premier livre du 1 tome, et le cinquième livre du 2 tome, de l'Art de la Guerre, par M. Turpin*. This work has been translated by captain Otway. 2. *Le Traité sur la Petite Guerre, par Grand Maison*. 3. *Le Partisan, par Jenny*. 4. *Principes sur la Petite Guerre: Ouvrage ajouté aux Instructions du Roi de Prusse*. 5. *La Petite Guerre, par M. le capt. Knock*. 6. *Sentimens d'un Officier Hessois sur l'art de conduire les détachemens à la guerre*. 7. *Le Chasseur à la Guerre, ou du service des troupes légères*. 8. *Observations sur le Service de Cavalerie à la Guerre, par le Chevalier de Shónacken*.

Although these celebrated writers ought to be considered by every young officer as the oracles of his profession, he must, nevertheless, guard his mind against that fatal persuasion which might lull it into a belief that nothing more is required than to peruse and to digest their rules and regulations. When he has made himself completely master of their thoughts he must endeavour to identify himself, as it were, with the authors and the generals themselves. By this method he will probably hit upon some of those hidden truths in military science from which many secondary ones are drawn; and in contemplating the commentaries, &c., of great generals, he will discover that they knew well how to calculate dangers; to appreciate probabilities, and, by occasionally deviating from ordinary rules and prescribed principles, how to move in untrodden paths, and to obtain signal advantages where, to superficial minds, nothing but desperate hazard and destruction appeared.

STRATFIELD-SAY, a parish in Holdshott hundred, Basingstoke division, Hants, eight miles north-east of Basingstoke, and fifty-three from London. The duke of Wellington has a noble

seat here, given to his grace by a vote of parliament as a national tribute for his eminent military services.

STRATFORD-ON-AVON, a market-town and parish in Barlichway hundred, Warwick. Eight miles south-west of Warwick, and ninety-four north-west from London, by Oxford; situate on the river Avon, over which is a bridge of brick and stone of fourteen arches. The town is well built, and the church, a noble building, has a lofty spire with six bells; its origin is very ancient, but many parts of it are modern. Here is also a chapel the gift of sir Hugh Clapton, in the reign of Henry VII. This place is celebrated as being the birth-place of William Shakspeare, who died in 1616, and has a neat monument in the church. The noted mulberry-tree which grew in the garden of the poet was destroyed by a successor, who having sold it to a carpenter, he ingeniously worked it into various ornaments and trinkets, many of which were bought by the corporation and distributed as compliments to different personages of renown. In September, 1769, was the first commemoration of Shakspeare's Jubilee, when an amphitheatre was erected on the plan of Ranelagh for the reception of its visitors from all parts of the kingdom. It lasted three days, during which time every species of entertainment was exhibited; such as concerts, oratorios, pageants, fireworks, illuminations, &c. In the guildhall, in which is transacted the town business, is a large room called Shakspeare's hall, adorned with two excellent paintings of Shakspeare and Garrick. It was rebuilt in 1768: over the hall is a free grammar-school. Here are also several good alms-houses. The chief trade is in corn and malt. The Avon is navigable to the Severn, and a canal lately completed opens a communication with the northern parts of the kingdom. Market on Friday. Fairs Thursday after Lady-day, May 14th, September 25th, and the Thursday se'nnight after.

STRATFORD, LONG, a hamlet in West-Ham parish, Beacontree hundred, Essex, being the first village in the county from London, and joined to Stratford-Bow by a stone bridge over the Lea, said to be the first arched stone bridge erected in England. To the south are the remains of a Cestercian monastery.

STRATFORD, STONY, a market-town situate partly in the parishes of Calverton and Wolverton, Newport hundred, Bucks, on the banks of the Ouse, over which it has a stone bridge to Old Stratford, in Norts. It is a long town, and lies six miles north-west from Fenny-Stratford, and fifty-two north-west from London. It had formerly two churches, or rather chapels of ease, but that on the east side of the road was nearly destroyed by fire in 1742, and has not since been rebuilt, but the tower is still standing; the other, dedicated to St. Giles, was rebuilt in a neat modern manner in 1777; here are meeting-houses for Baptists and other dissenters. It is supposed to have derived its name of Stony, to distinguish it from Fenny-Stratford, and from its being situate on the Watling Street Roman paved road. The only manufacture here is that of lace-making. The town has many charity-schools, and a society

for apprenticing out children. The market on Friday is well supplied with provisions, and considerable quantities of corn are sold here, forming the principle traffic and support of the place. The Fairs are August 2d, October 10th, and November 12th, for provisions, cattle, pedlary &c., and on the Friday before Old Michaelmas-day is a statute fair.

STRATIOTES, water soldier, in botany, a genus of plants belonging to the class of polyandria, and to the order of hexagynia; natural order first, palmæ. The spatula is diphyllous; the perianthium is trifid. There are three petals, and the berry is six-celled and inferior. There are three species; 1. *S. acroides*; 2. *S. alismoides*; and 3. *S. aloides*, which alone is of British extraction, which is also called the water aloe, or fresh water soldier. The root consists of long fibres tufted at the ends. The leaves are thick, triangular, pointed, and prickly at the edges. The flowers are white and floating on the water, and blossom in June. This plant may be seen in slow rivers and fens.

STRATO, a philosopher of Lampsacus, disciple and successor in the school of Theophrastus, about A. A. C. 248. He applied himself with uncommon industry to the study of nature; but, after the most mature investigations, he supported that nature was inanimate, and that there was no God but nature. See **PLASTIC NATURE**. He was preceptor to Ptolemy Philadelphus, who revered his abilities and learning, and rewarded his labors with unbounded liberality. He wrote different treatises, all now lost.

STRATONICE, the beautiful daughter of Demetrius Poliorcetes, and the wife, first of Seleucus Nicator, king of Syria, and afterwards of his son, Antiochus Soter, with his full consent. The circumstances of the case were extraordinary, and, if any thing could justify such an incestuous connexion, they were indeed such. Antiochus fell sick and was at the point of death, to the great grief of his father, but the cause of his illness was unknown; till Erasistratus, the physician, observing his pulse to beat high every time his step-mother came into his room, immediately guessed the cause. Upon his putting the question to him, Antiochus confessed, what he had hitherto concealed, his affection for his step-mother. Seleucus, willing to save his son and heir, yielded up his wife, and they were regularly married. And thus Stratonicæ became the progenitrix of that impious race of princes who afterwards so cruelly persecuted the Jews. See **JEWS** and **SYRIA**. But, allowing for Seleucus's total ignorance of the divine law, his paternal affection and generosity in so readily yielding up his wife to save his son, appear almost an act of virtue. At least it affords a striking contrast to the conduct of a Christian prince in modern times (if a Christian we may call him, who murdered his subjects by millions for their religion), Philip II. of Spain, who, after his son prince Charles had seen and was betrothed to the princess Elizabeth of France, whose affection for him was mutual, had the monstrous barbarity to separate the lovers, to marry the princess himself, and then to murder his son, the prince, because he repined at his villany. See **PHILIP II.**

STRATONICEA, an ancient city of Asia built by Seleucus, and so named by him in honor of Stratonicæ. It is now called Eski-Hissar.

STRATONICI, the followers of Strato; an ancient atheistical sect. See **HYDOZOISTS**.

STRATTON, a market-town in the hundred of the same name, Cornwall, seven miles W. S. W. from Holdsworth, and 222 from London. Here is a meeting-house for Wesleyan methodists. During the civil war the famous battle of Stratton was fought near this place. Market on Tuesday. Fairs, May 19th, November 8th, and December 11th.

STRATUM, *n. s.* } Lat. *stratum*. A bed;
STRATA. } a layer: a term of philosophy: strata, the plural.

The terrestrial matter is disposed into *strata*, or layers, placed one upon another; in like manner as any earthy sediment, settling down from a fluid, will naturally be. *Woodward.*

Another was found in a perpendicular fissure of a *stratum* of stone in Langron iron-mine, Cumberland. *Id.*

With how much wisdom are the *strata* laid,
Of different weight and of a different kind,
Of sundry forms for sundry ends designed!

Blackmore.

Drilled through the sandy *stratum* every way
The waters with the sandy *stratum* rise. *Thomson.*

STRAUBING, a large town of Bavaria, on the right bank of the Danube, stands partly on a height, and is divided into Upper and Lower. It is tolerably well built, and surrounded with a wall: the bridge over the river is defended, since 1809, by a tête de pont. It is the seat of a high court of justice, has several churches and charitable institutions, a flourishing academy, and, in a convent of Ursuline nuns, an establishment for female education; with well frequented markets of corn and cattle, and a trade on the Danube. The environs are fertile, but the town has suffered much from fire. Sixty-six miles N. N. E. of Munich, and twenty-three E. S. E. of Ratisbon.

STRAW, *n. s.* } Saxon *strop*; Belgic
STRAWBERRY, } *stroo*; Goth. *strao*. The
STRAWBUILT, *adj.* } stalk on which corn grows;
STRAWCOLORED, } any stalk; any thing of
STRAWY. } small value: strawberry
is a fruit with a straw-like stem: *strawy*, consisting of or abundant in straw: the compounds seem to explain themselves.

I can counterfeit the deep tragedian,
Tremble and start at wagging of a *straw*,
Intending deep suspicion.

Shakspeare. Richard III.

I will discharge it in your *strawcoloured* beard.
Shakspeare.

There the *strawy* Greeks, ripe for his edge,
Fall down before him like the mower's swath. *Id.*
Apples in hay and *straw* ripened apparently; but the apple in the *straw* more.

Bacon's Natural History.

Thy arms, thy liberty beside,
All that's on the outside of thy hide,
Are mine by military law,
Of which I will not bate one *straw*. *Hudibras.*

They on the smoothed plank,
The suburb of their *strawbuilt* citadel,
New rubbed with balm expatiate. *Milton.*

In a field of corn, blown upon by the wind, there will appear waves of a colour differing from that of the rest; the wind, by depressing some of the ears, and not others, makes the one reflect more from the lateral and *strawy* parts than the rest.

Boyle on Colours.

Content with food which nature freely bred,
On wildings and on *strawberries* they fed. *Dryden.*
'Tis not a *straw* matter whether the main cause
be right or wrong. *L'Estrange.*

My new *straw* hat thus trimly lined with green
Let Peggy wear. *Gay's Pastorals.*

Strawberries, by their fragrant smell, seem to be cordial: the seeds obtained by shaking the ripe fruit in winter are an excellent remedy against the stone. The juice of *strawberries* and lemons, in spring-water, is an excellent drink in bilious fevers.

Arbuthnot on Diet.

More light he treads, more tall he seems to rise,
And struts a *straw* breadth nearer to the skies.

Tickel.

STRAWBERRY, in botany. See FRAGARIA.

STRAY, *v. n., v. a., & n. s.* Ital. *stravviare*, of Lat. *extra via*, to wander. To wander; rove; range beyond limits; err: to mislead: the act of erring; any erring creature or thing.

We have erred and *strayed*. *Common Prayer.*

What grace hath thee now hither brought this way?

Or doen thy feeble feet unweeting hither *stray*?

Spenser.

Nowhere can I *stray*,
Save back to England: all the world's my way.

Shakspeare.

She hath herself not only well defended,
But taken and impounded as a *stray*
The king of Scots. *Id. Henry V.*

I would not from your love make such a *stray*,
To match you where I hate. *Shakspeare.*

Hath not else his eye
Strayed his affections in unlawful love? *Id.*

My eye, descending from the hill, surveys
Where Thames among the wanton valley *strays*.
Denham.

Should I take you for a *stray*,
You must be kept a year and day. *Hudibras.*

Wand'rest thou within this lucid orb,
And *strayed* from those fair fields of light above,
Amidst this new creation want'st a guide
To reconduct thy steps? *Dryden.*

He cries out, Neighbour, hast thou seen a *stray*
Of bullocks and of heifers pass this way? *Addison.*

When he has traced his talk through all its wild
rambles, let him bring home his *stray*; not like the
lost sheep, with joy, but with tears of penitence.

Government of the Tongue.

STRAY, or ESTRAY, signifies any tame beast, as sheep, oxen, swine, and horses, or swans, found within a lordship, and not owned by any man; in which case, being cried according to law, in the church and two market-towns adjoining, if it be not claimed by the owner within a year and a day, it becomes the lord's of the soil where found. If the owner claims it within the year and a day, he must pay the charges of finding, keeping, and proclaiming; and he also may seize it, without telling the marks, or proving his property, which may be done at the trial if contested. If the beast *stray* within the year to another lordship, the first lord cannot retake it. An *estray* must be fed and kept, uninjured, and without labor, till it is reclaimed, or the limited time expire.

STREAK, *n. s. & v. a.* } Sax. *ƿreice*; Belg. *streak'y*, adj. } *streke*; Ital. *stria*.

A line of color different from that of the ground: sometimes written *strake*: to *stripe*: *variegated*: draw out in *stripes*: *streaky* is *striped*.

The west yet glimmers with some *streaks* of day;
Now spurs the lated traveller apace,
To gain the timely inn. *Shakspeare. Macbeth.*

All the yearlings which were *streaked* and pied
Should fall as Jacob's hire.

Id. Merchant of Venice.

She lurks in midst of all her den, and *streaks*
From out a ghastly whirlpool all her necks;
Where, glotting round her rock, to fish she falls.

Chapman.

To morrow, ere fresh morning *streak* the east,
When first approach of light we must be risen,
And at our pleasant labour, to reform
Yon flowery arbours. *Milton.*

When the hoary head is hid in snow,
The life is in the leaf, and still between
The fits of falling snows appears the *streaky* green.
Dryden.

The night comes on, we eager to pursue
Till the last *streaks* of dying day withdrew,
And doubtful moonlight did our rage subdue. *Id.*

While the fantastic tulip strives to break
In two-fold beauty and a parted *streak*. *Prior.*

Now let us leave this earth, and lift our eye
To the large convex of yon azure sky;
Behold it like an ample curtain spread,
Now *streaked* and glowing with the morning red,
Anon at noon in flaming yellow bright,
And chusing sable for the peaceful night. *Prior.*

STREAM, *n. s., v. n., &* } Saxon *ƿream*; Dan. *STREAMER, n. s.* } *Swed. strom*; Belg. *stroom*.
STREAM'Y, adj. } *stream*; Belg. *stroom*.

A running water; the course of running water; a current; any thing forcibly or constantly issuing: to flow; run; issue constantly: to mark with colors in tracts: a streamer is an ensign; flag: streamy, abounding in streams; running in a current.

He brought *streams* out of the rock, and caused waters to run down like rivers. *Ps. lxxviii. 16.*

The breath of the Lord is like a *stream* of brimstone. *Isaiah.*

As plays the sun upon the glassy stream,
Twinkling another counterfeited beam.
Shakspeare. Henry VI.

The very *stream* of his life, and the business he hath helmed, must give him a better proclamation. *Shakspeare.*

His brave fleet

With silken *streamers* the young Phœbus fanning.
Id.

Had their cables of iron chains had any great length, they had been unportable; and, being short, the ships must have sunk at an anchor in any *stream* of weather. *Ruleigh.*

The herald's mantle is *streamed* with gold. *Bacon.*

O could I flow like thee, and make thy *stream*
My great example, as thou art my theme!
Tho' deep yet clear, tho' gentle yet not dull,
Strong without rage, without o'erflowing full.
Denham.

Cocitus named of lamentation loud
Heard in the rueful *stream*; fierce Phlegethon,
Whose waves of torrent fire inflame with rage;
Far off from these a slow and silent *stream*,
Lethe, the river of oblivion, rolls
Her wa'try labyrinth. *Milton.*

God bad the ground be dry,
All but between those banks where rivers now
Stream, and perpetual draw their humid train. *Id.*
Thus, from one common source our *streams* divide ;
Ours is the Trojan, your's the Arcadian side.

Dryden.
You, Drances, never want a *stream* of words. *Id.*

The rosy morn began to rise,
And wai'd her saffron *streamer* through the skies. *Id.*

It is looked upon as insolence for a man to adhere
to his own opinion, against the current *stream* of an-
tiquity. *Locke.*

The man of sense his meat devours,
But only smells the peel and favours :
And he must be an idle dreamer,
Who leaves the pie, and gnaws the *streamer*. *Prior.*
Arcadia,

However *streamy* now, adust and dry,
Denied the goddess water : where deep Melas
And rocky Cratis flow, the chariot smok'd
Obscure with rising dust. *Id.*

The *stream* of beneficence hath, by several rivulets
which have since fallen into it, wonderfully enlarged
its current. *Atterbury.*

Before him flaming his enormous shield
Like the broad sun, illumined all the field ;
His nodding helm emits a *streaming* ray. *Pope's Iliad.*

On all sides around
Streams the black blood, and smokes upon the
ground. *Pope.*

Then grateful Greece with *streaming* eyes would
raise
Historick marbles to record his praise. *Id.*

From opening skies may *streaming* glories shine,
And saints embrace thee. *Id.*

STREATER (Robert), an English painter,
born in 1624. He was esteemed the most uni-
versal painter England ever bred. At the resto-
ration in 1660 he was made serjeant painter to
the king. He died of the stone in 1680.

STREET, *n. s.* Sax. *stret*; Isl. *stradu* ;
Dan. *streede* ; Belg. *stract* ; Lat. *stratum*. A
way ; properly a paved way between rows of
houses ; a public place or way.

That there be no leading into captivity, and no
complaining in our *streets*. *Ps. cxliv. 14.*

The *streets* are no larger than alleys. *Sandys.*
He led us through fair *streets* ; and all the way we
went there were gathered people on both sides,
standing in a row. *Bacon.*

When night
Darkens the *streets*, then wander forth the sons
Of Belial, flown with insolence and wine ;
Witness the *streets* of Sodom. *Milton.*

The Italians say the ancients always considered
the situation of a building, whether it were high or
low, in an open square, or in a narrow *street*, and
more or less deviated from their rule of art.
Addison on Italy.

Our publick ways would be so crowded, that we
should want *street*-room. *Id. Spectator.*

Let us reflect upon what we daily see practised in
the world ; and can we believe, if an apostle of
Christ appeared in our *streets*, he would retract his
caution, and command us to be conform'd to the
world ? *Rogers's Sermons.*

When you tattle with some crouy servant in the
same *street*, leave your own *street*-door open. *Swift.*

STRELITZ, a city of Germany, capital of the
grand duchy of Mecklenburg-Strelitz, is situated

in the iordship of Stargard in the midst of lakes
and marshes. It is divided into Old and New
Strelitz, which form properly two towns, a mile
distant from each other. Old Strelitz was for-
merly the ducal residence, but the palace having
been burned in 1713, the duke built a new one
at Glienke, a place at a little distance, and in
1733 founded a town called New Strelitz. The
two came in time to be considered as one town.
Old Strelitz contains 3000 inhabitants. New, a
better built place, has 4000, with a distinct ma-
gistracy. The manufactures consist of woollen,
linen, and, in a small degree, of tobacco. Here
are also the public offices of the duchy. Fifty-
seven miles north by west of Berlin.

STRENÆ (Lat.), in Roman antiquity, new
year's gifts, or presents made on the first day
of the year, as a happy omen, and mark of
the giver's good will. This practice took place
so early as the reign of Titus Tatius, king of the
Sabines, and colleague of Romulus ; who having
received on the first day of the year a present
of some sprigs of vervain, gathered in a wood
consecrated to the goddess Strenia, authorized
this custom to be observed afterwards, and gave
to all such presents the name of Strenæ. The
Romans on that day celebrated a festival in
honor of Janus and Juno. See YEAR.

STRENGTH, *n. s. & v. a.* Sax. *strengh* ;
STRENGTHEN, *v. a. & v. n.* Teut. and Belg.
STRENGTHENER, *n. s.* *strengh* ; Gothic
STRENGTHLESS, *adj.* *dreing*. See
STRENGTHNER, *n. s.* STRONG. Vigor ;

power ; force ; firmness ; power of resistance ;
security : hence mental power ; animation ; va-
lidity ; argumentative force or prevalence ; a
fortification or fortress used by Daniel for to
strengthen, which signifies to make strong ; in-
crease in power or strength ; confirm ; estab-
lish ; animate : and, as a verb neuter, to grow
strong : a strengthener is that which gives
strength : strengthless, weak ; wanting or de-
prived of strength.

Charge Joshua, and encourage him, and strengthen
him. *Deuteronomy.*

Let us rise up and build : so thy strengthened
their hands for this work. *Nehemiah ii. 18.*

They sought the *strengthening* of the heathen.

This presupposed, it may then stand very well
with *strength* and soundness of reason thus to answer.
Hooker.

Our castle's *strength*

Will laugh a siege to scorn. *Shakespeare.*

What is his *strength* by land ?

Id. Antony and Cleopatra.

Let noble Warwick, Cobham, and the rest,

With powerful policy *strengthen* themselves. *Id. Henry VI.*

As the wretch, whose fever-wakened joints,

Like *strengthless* hinges, buckle under life,

Impatient of his fit, breaks like a fire

Out of his keeper's arms. *Id. Henry IV.*

The rashness of talking should not only be re-
tarded by the guard of our heart, but fenced in by
certain *strengths* placed in the mouth.

Ben Jonson's Discoveries.

Edward's happy-ordered reign most fertile breeds
Plenty of mighty spirits, to *strengthen* his state.

Daniel.

Strength there must be either of love or war, even such contrary ways leading to the same unity.

Holiday.

Betrayed in all his *strengths*, the wood beset ;
All instruments, all arts of ruin met. *Denham.*

Thou must outlive

Thy youth, thy *strength*, thy beauty, which will change

To withered, weak, and grey. *Milton.*

He thought

This inaccessible high *strength* to have seized. *Id.*

Oh men for flattery and deceit renowned !

'Thus when y' are young ye learn it all like him ;

Till, as your years increase, that *strengthens* too,

T' undo poor maids. *Otway's Orphan.*

Authority is by nothing so much *strengthened* and confirmed as by custom ; for no man easily distrusts the things which he and all men have been bred up to. *Temple.*

Garlick is a great *strengtheners* of the stomach, upon decays of appetite, or indigestion. *Id.*

This liquor must be inflammable or not, and yet subtle and pungent, which may be called spirit ; or else *strengthless* or insipid, which may be named phlegm. *Boyle.*

Aristotle's large views, acuteness, and penetration of thought, and *strength* of judgment, few have equalled. *Locke.*

What they boded would be a mischief to us, you are providing shall be one of our principal *strengths*. *Sprat's Sermons.*

The allies, after a successful summer, are too apt, upon the *strength* of it, to neglect their preparations for the ensuing campaign. *Addison.*

He enjoyed the greatest *strength* of good sense, and the most exquisite taste of politeness. *Id.*

We, like friendly colours, found our hearts unite, And each from each contract new *strength* and light. *Pope.*

The disease, that shall destroy at length,
Grows with his growth, and *strengthens* with his *strength*. *Id.*

If it were true that women were thus naturally vain and light, then how much more blameable is that education which seems contrived to *strengthen* and increase this folly ! *Law.*

STRENGTH, in mythology, the daughter of Pallas the giant, by the nymph Styx, and the sister of Valor and Victory.

STRENGTH OF MATERIALS, in mechanics, is a subject of so much importance that in a nation so eminent as this for invention and ingenuity in all species of manufactures, and in particular so distinguished for its improvements in machinery of every kind, it is somewhat singular that no writer has treated it in the detail which its importance and difficulty demand. The man of science who visits our great manufactures is delighted with the ingenuity which he observes in every part, the innumerable inventions which come even from individual artisans, and the determined purpose of improvement and refinement which he sees in every workshop. Every cotton-mill appears an academy of mechanical science ; and mechanical invention is spreading from these fountains over the whole kingdom. But the philosopher is mortified to see this ardent spirit so cramped by ignorance of principle, and many of these original and brilliant thoughts obscured and clogged with needless and even hurtful additions, and a complication of machinery which checks improvement even by its

appearance of ingenuity. There is nothing in which this want of scientific education, this ignorance of principle, is so frequently observed, as in the injudicious proportion of the parts of machines and other mechanical structures ; proportions and forms of parts in which the strength and position are no wise regulated by the strains to which they are exposed, and where repeated failures have been the only lessons.

The strength of materials arises immediately or ultimately from the cohesion of the parts of bodies. Our examination of this property of tangible matter has as yet been very partial and imperfect, and by no means enables us to apply mathematical calculations with precision and success. The various modifications of cohesion, in its different appearances of perfect softness, plasticity, ductility, elasticity, hardness, have a mighty influence on the strength of bodies, but are hardly susceptible of measurement. Their texture also, whether uniform like glass and ductile metals, crystallised or granulated like other metals and freestone, or fibrous like timber, is a circumstance no less important ; yet even here, although we derive some advantage from remarking to which of these forms of aggregation a subject belongs, the aid is but small. All we can do in this want of general principles is to make experiments on every class of bodies. Accordingly, philosophers have endeavoured to instruct the public in this particular. The Royal Society of London at its very first institution made many experiments at their meetings, as may be seen in the first registers of the Society. Several individuals have added their experiments. The most numerous collection in detail is by Muschenbroek, professor of natural philosophy at Leyden. Part of it was published by himself in his *Essais de Physique*, in 2 vols. 4to. ; but the full collection is to be found in his system of Natural Philosophy, published after his death by Lulofs, in 3 vols. 4to. This was translated from the Low Dutch into French, by Sigaud de la Fond, and published at Paris in 1760, and is a prodigious collection of physical knowledge of all kinds, and may almost suffice for a library of natural philosophy. But this collection of experiments on the cohesion of bodies is not of that value which one expects. We presume that they were carefully made and faithfully narrated ; but they were made on such small specimens that the unavoidable natural inequalities of growth or texture produced irregularities in the results, which bore too great a proportion to the whole quantities observed. We may make the same remark on the experiments of Couplet, Pitot, De la Hire, Du Hamel, and others of the French academy. In short, if we except the experiments of Buffon on the strength of timber, made at the public expense on a large scale, there is nothing to be met with from which we can obtain absolute measures which may be employed with confidence ; and there is nothing in the English language, except a simple list by Emerson, which is merely a set of affirmations without any narration of circumstances, to enable us to judge of the validity of his conclusions ; but the character of Mr. Emerson, as a

man of knowledge and of integrity, gives even to these assertions a considerable value. But to make use of any experiments there must be employed some general principle by which we can generalise their results. They will otherwise be only narrations of detached facts. We must have some notion of that intermedium, by the intervention of which an external force applied to one part of a lever, joist, or pillar, occasions a strain on a distant part. This can be nothing but the cohesion between the parts. It is this connecting force, which is brought into action, or, as we more shortly express it, excited. This action is modified in every part by the laws of mechanics. It is this action which is what we call the strength of that part, and its effect is the strain on the adjoining parts; and thus it is the same force, differently viewed, that constitutes both the strain and the strength. When we consider it in the light of a resistance to fracture, we call it strength: we call every thing a force, which we observe to be ever accompanied by a change of motion; or, more strictly speaking, we infer the presence and agency of a force wherever we observe the state of things in respect of motion different from what we know to be the result of the action of all the forces which we know to act on the body. Thus, when we observe a rope to prevent a body from falling, we infer a moving force inherent in the rope with as much confidence as when we observe it drag the body along the ground. The immediate action of this force is undoubtedly exerted between the immediately adjoining parts of the rope. The immediate effect is the keeping the particles of the rope together. They ought to separate by any external force drawing the ends of the rope contrarywise; and we ascribe their not doing so to a mechanical force really opposing this external force. When desired to give it a name, we name it from what we conceive to be its effect, and therefore its characteristic, and we call it cohesion. This is merely a name for the fact; but it is the same thing in all our denominations. We know nothing of the causes but in the effects; and our name for the cause is in fact the name of the effect, which is cohesion. We mean nothing else by gravitation or magnetism. What do we mean when we say that Newton understood thoroughly the nature of gravitation, of the force of gravitation; or that Franklin understood the nature of the electric force? Nothing but this: Newton considered with patient sagacity the general facts of gravitation, and has described and classed them with the utmost precision. In like manner we shall understand the nature of cohesion, when we have discovered with equal generality the laws of cohesion, or general facts which are observed in the appearances, and when we have described and classed them with equal accuracy. Let us therefore attend to the more simple and obvious phenomena of cohesion, and mark with care every circumstance of resemblance by which they may be classed. Let us receive these as the laws of cohesion characteristic of its supposed cause, the force of cohesion. We cannot pretend to enter on this vast research. The modifications are innumerable;

and it would require the penetration of more than Newton to detect the circumstance of similarity amidst millions of discriminating circumstances. Yet this is the only way of discovering which are the primary facts characteristic of the force, and which the modifications. The study is immense, but is by no means desperate; and we entertain great hopes that it will ere long be successfully prosecuted; but, in our particular predicament, we must content ourselves with selecting such general laws as seem to give us the most immediate information of the circumstances that must be attended to by the mechanic in his constructions, that he may unite strength with simplicity, economy, and energy. 1st, Then, it is a matter of fact that all bodies are in a certain degree perfectly elastic; that is, when their form of bulk is changed by certain moderate compressions or distractions, it requires the continuance of the changing force to continue the body in this new state; and when the force is removed the body recovers its original form. We limit the assertion to certain moderate changes: for instance, take a lead wire one-fifteenth of an inch in diameter and ten feet long; fix one end firmly to the ceiling, and let the wire hang perpendicular; affix to the lower end an index like the hand of a watch; on some stand immediately below let there be a circle divided into degrees, with its centre corresponding to the lower point of the wire; now turn this index twice round; and thus twist the wire. When the index is let go, it will turn backward again by the wire's untwisting itself, and make almost four revolutions before it stops; after which it twists and untwists many times, the index going backwards and forwards round the circle, diminishing however its arch of twist each time, till at last it settles precisely in its original position. This may be repeated for ever. Now, in this motion, every part of the wire partakes equally of the twist. The particles are stretched, require force to keep them in their state of extension, and recover completely their original relative positions. These are all the characters of what the mechanician calls perfect elasticity. See ELASTICITY. This is a quantity quite familiar in many cases; as in glass, tempered steel, &c., but was thought incompetent to lead, which is generally considered as having little or no elasticity. But we make the assertion in the most general terms, with the limitation to moderate derangement of form. We have made the same experiment on a thread of pipe-clay, made by forcing soft clay through the small hole of a syringe by means of a screw; and we found it more elastic than the lead wire: for a thread of one-twentieth of an inch diameter and seven feet long allowed the index to make two turns, and yet completely recovered its first position. 2dly. But, if we turn the index of the lead wire four times round, and let it go again, it untwists again in the same manner, but it makes little more than four turns back again; and after many oscillations it finally stops in a position almost two revolutions removed from its original position. It has now acquired a new arrangement of parts, and this new arrangement is permanent like the former; and, what is of particular moment, it is perfectly elastic. This change is familiarly

known by the denomination of a set. The wire is said to have taken a set. When we attend minutely to the procedure of nature in this phenomenon, we find that the particles have as they were slid on each other, still cohering, and have taken a new position, in which their connecting forces are in equilibrio; and in this change of relative situation it appears the connecting forces, which maintained the particles in their first situations, were not in equilibrio in some position intermediate between that of the first and that of the last form. The force required for changing this first form augmented with the change, but only to a certain degree; and during this process the connecting forces always tended to the recovery of this first form. But, after the change of mutual position has passed a certain magnitude, the union has been partly destroyed, and the particles have been brought into new situations; that the forces which now connect each with its neighbour tend, not to the recovery of the first arrangement, but to push them farther from it, into a new situation, to which they now verge, and require force to prevent them from acquiring. The wire is now in fact again perfectly elastic; that is, the forces which now connect the particles with their new neighbours augment to a certain degree as the derangement from this new position augments. This is reasoning not from any theory. It is narrating facts on which a theory is to be founded. What we have been just now saying is evidently a description of that sensible form of tangible matter which we call ductility. It has every gradation of variety, from the softness of butter to the firmness of gold. All these bodies have some elasticity; but we say they are not perfectly elastic, because they do not completely recover their original form when it has been greatly deranged. The whole gradation may be most distinctly observed in a piece of glass or hard sealing-wax. In the ordinary form glass is perhaps the most completely elastic body that we know, and may be bent till just ready to snap, and yet completely recovers its first form, and takes no set whatever; but when heated to such a degree as just to be visible in the dark, it loses its brittleness, and becomes so tough that it cannot be broken by any blow; but it is no longer elastic, takes any set and keeps it. When more heated it becomes as plastic as clay; but in this state is remarkably distinguished from clay by a quality which we may call viscosity, which is something like elasticity, of which clay and other bodies purely plastic exhibit no appearance. This is the joint operation of strong adhesion and softness. When a rod of perfectly soft glass is suddenly stretched a little, it does not at once take the shape which it acquires after a short time. It is owing to this that, in taking the impression of a seal, if we take off the seal while the wax is yet very hot, the sharpness of the impression is destroyed immediately. Each part drawing its neighbour, and each part yielding, the prominent parts are pulled down and blunted, and the sharp hollows are pulled upwards and also blunted. The seal must be kept on till all has become not only stiff but hard. This viscosity is to be observed in all plastic bodies which are homogeneous. It is not observed in clay, because

it is not homogeneous, but consists of hard particles of the argillaceous earth sticking together by their attraction for water. Something like it might be made of finely powdered glass and a clammy fluid such as turpentine. Viscidity has all degrees of softness till it degenerates to ropy fluidity like that of olive oil. When ductility and elasticity are combined, in different proportions, an immense variety of sensible modes of aggregation may be produced. Some degree of both is probably to be observed in all bodies of complex constitution; that is, which consist of particles made up of many different kinds of atoms. Such a constitution of a body must afford many situations permanent, but easily deranged. In all these changes of disposition which take place among the particles of a ductile body, the particles are at such distance that they still cohere. The body may be stretched a little; and, on removing the extending force, the body shrinks into its first form. It also resists moderate compressions; and when the compressing force is removed the body swells out again. Now the corpuscular fact here is, that the particles are acted on by attractions and repulsions, which balance each other when no external force is acting on the body, and which augment as the particles are made, by any external cause, to recede from this situation of mutual inactivity; for since force is requisite to produce either the dilatation or the compression, and to maintain it, we are obliged, by the constitution of our minds, to infer that it is opposed by a force accompanying or inherent in every particle of dilatable or compressible matter: and as this necessity of employing force to produce a change indicates the agency of these corpuscular forces, and marks their kind according as the tendencies of the particles appear to be toward each other in dilatation, or from each other in compression; so it also measures the degrees of their intensity. Should it require three times the force to produce a double compression, we must reckon the mutual repulsions triple when the compression is doubled; and so in other instances. We see from all this that the phenomena of cohesion indicate some relation between the intensity of the force of cohesion and the distance between the centres of the particles. To discover this relation is the great problem in corpuscular mechanism, as it was in the Newtonian investigation of the force of gravitation. Could we discover this law of action between the corpuscles with the same certainty and distinctness, we might with equal confidence say what will be the result of any position which we give to the particles of bodies: but this is beyond our hopes. The law of gravitation is so simple that the discovery or detection of it amid the variety of celestial phenomena required but one step; and in its own nature its possible combinations still do not greatly exceed the powers of human research. One is almost disposed to say that the Supreme Being has exhibited it to our reasoning powers as sufficient to employ with success our utmost efforts, but not so abstruse as to discourage us from the noble attempt. It seems to be otherwise with respect to cohesion. Mathematics informs us that, if it deviates sensibly from the law of gravitation, the simplest combinations will make the joint action

of several particles an almost impenetrable mystery. We must therefore content ourselves, for a long while to come, with a careful observation of the simplest cases that we can propose, and with the discovery of secondary laws of action, in which many particles combine their influence. Our readers are requested to accept of these endeavours, not so much to communicate information on this important and difficult subject, as to excite curiosity and farther experiments. Many useful deductions might be made from these premises respecting the manner of disposing and combining the strength of materials in our structures. The best form of joints, mortises, tenons, scarfs; the rules for juggling, tabling, faying, fishing, &c., practised in the delicate art of mast-making, are all founded on this doctrine: but the discussion of these would be equivalent to writing a complete treatise of carpentry. We hope that this will be executed by some intelligent mechanic; for there is nothing in our language on this subject but what is almost contemptible; yet there is no mechanic art that is more susceptible of scientific treatment. Such a treatise, if well executed, could not fail of being well received by the public in this age of mechanical improvement.

STRENGTHENERS, or corroborants, such medicines as add to the bulk and firmness of the solids; and such are all agglutinant and astrigent medicines. See **MATERIA MEDICA**.

STRENUOUS, *adj* Lat. *strenuus*. Brave; bold; active; valiant; dangerously laborious.

Nations grown corrupt
Love bondage more than liberty;
Bondage with ease than *strenuous* liberty.

Milton's Agonistes.

Many can use both hands, yet will there divers remain that can *strenuously* make use of neither.

Browne's Vulgar Errors.

There was no true catholick but *strenuously* contended for it.

Waterland.

He resolves to be *strenuous* for taking off the test, against the maxims of all wise Christian governments, which always had some established religion, leaving at best a toleration to others. *Swift to Pope.*

Writers dispute *strenuously* for the liberty of conscience, and inveigh largely against all ecclesiasticks under the name of high church. *Swift.*

STREPEROUS, *adj*. Lat. *strepo*. Loud; noisy.

Porta conceives, because in a *streperous* eruption it riseth against fire, it doth therefore resist lightning. *Browne.*

STRESS, *n. s. & v. a.* Sax. *ƿrecc*, violence; or from **DISTRESS**, which see. Importance; important part; weight; violence; force: to stress is to distress.

It shewed how very little *stress* is to be laid upon the precedents they bring. *Lesley.*

Stirred with pity of the *stressed* plight
Of this sad realm. *Spenser.*

By *stress* of weather driven,
At last they landed. *Dryden's Æneid.*

A body may as well lay too little as too much *stress* upon a dream; but the less we heed them the better. *L'Estrange.*

This, on which the great *stress* of the business depends, would have been made out with reasons sufficient. *Locke.*

Though the faculties of the mind are improved by exercise, yet they must not be put to a *stress* beyond their strength. *Id.*

Consider how great a *stress* he laid upon this duty, while upon earth, and how earnestly he recommended it. *Atterbury.*

STRETCH, *v. a. v. n.*, & } Sax. *ƿreccan*;
STRETCHER, *n. s.* [*n. s.*] Belgic *strecken*.
To extend; spread out to a distance; elongate; expand; strain: to be extended; bear extension; push beyond the truth: as a noun substantive reach; extension; effort: struggle; utmost reach: a stretcher is any instrument of extension.

Take thy rod, and *stretch* out thine hand.

Exodus vii. 19.

The *stretching* out of his wings snall fill the breadth of thy land.

Isaiah viii. 8.

Idolatry is a horrible sin, yet doth repentance *stretch* unto it. *Whitgift.*

This kiss, if it durst speak,
Would *stretch* thy spirits up into the air.

Shakspeare. King Lear.

A third? a fourth?

What! will the line *stretch* out to the' craek of doom?

Shakspeare.

His hopes entiled

His strength, the *stretchor* of Ulysses' string,
And his steele's piercer. *Chapman.*

This to rich Ophir's rising morn is known,
And *stretched* out far to the burnt swarthy zone.

Cowley.

Leviathan on the deep

Stretched like a promontory, sleeps. *Milton.*

Eden *stretched* her line

From Auran eastward to the royal towers

Of great Seleucia, built by Greeian kings. *Id.*

Regions to which

All thy dominion, Adam, is no more

Than what this garden is to all the earth

And all the sea, from one entire globeose

Stretched into longitude. *Id.*

Your dungeon *stretching* far and wide beneath. *Id.*

The inner membrane, that involved the liquors of the egg, because it would *stretch* and yield, remained unbroken. *Boyle.*

He thought to swim the stormy main,
By *stretch* of arms the distant shore to gain.

Dryden's Æneid.

This fiery speech inflames his fearful friends;
They tug at every oar, and every *stretcher* bends.

Dryden.

Those put a lawful authority upon the *stretch*, to the abuse of power, under the colour of prerogative. *L'Estrange.*

Disruption, as strong as they are, the bones would be in some danger of, upon a great and sudden *stretch* or contortion, if they were dry.

Ray on the Creation.

Tooth in the *stretching* course two inches with the *stretcher* only. *Mozon.*

So the *stretched* cord the shakled dancer tries. *Smith.*

Upon this alarm we made incredible *stretches* towards the south, to gain the fastnesses of Preston. *Addison.*

What an allay do we find to the credit of the most probable event that is reported by one who uses to *stretch*!

Government of the Tongue.

This is the utmost *stretch* that nature can,
And all beyond is fulsome, false, and vain.

Granville.

STRETTO, in Italian music, is sometimes

U

used to signify that the measure is to be short and concise, and consequently quick. In this sense it stands opposed to Largo.

STRETTON, a parish of England, in Rutlandshire, nine miles north-east by east of Oakham.

STRETTON, a township of England, in Staffordshire, three miles south-west by west of Penkridge.

STREW, *v. a.* } Sometimes strow. Skin-
STREWMENT, *n. s.* } ner proposes strow, and Junius writes straw. Sax. *strewian*; Gothic *strawan*; Belg. *stroyen*; Dan. *strøer*. 'Perhaps strow is best,' says Johnson, 'being that which reconciles etymology with pronunciation.' To spread by scattering, or being scattered; to scatter loosely: the noun substantive corresponding.

The calf he burnt in the fire, ground it to powder, and *strowed* it upon the water, and made Israel drink of it. *Ezodus.*

Synah, can I tell thee more?

And of our ladies bowre;

But little need to *strow* my store,

Success this hill of our.

Spenser.

I thought thy bride bed to have decked, sweet maid!

And not have *strew'd* thy grave.

Shakespeare. Hamlet.

Her death was doubtful.—For charitable prayers, Shards, flints, and pebbles should be thrown on her; Yet here she is allowed her virgin chants, Her maiden *strowments*, and the bringing home Of bell and burial. *Id.*

Angel forms lay entranced
 Thick as autumnal leaves that *strow* the brooks
 In Valombrosa. *Milton's Paradise Lost.*

All the ground

With shivered armour *strown*.

Id.

The tree in storms

The glad earth about her *strows*

With treasure from her yielding boughs. *Waller.*

Come, shepherds, come, and *strow* with leaves the plain;

Such funeral rites your Daphnis did ordain.

Dryden.

With furies and nocturnal orgies fired,
 Whom e'en the savage beasts had spared, they killed,

And *strowed* his mangled limbs about the field. *Id.*

Is thine alone the seed that *strows* the plain?

The birds of heaven shall vindicate their grain.

Pope.

Possession kept the beaten road,

And gathered all his brother *strowed*.

Swift.

STRÆ, *n. s.* } Lat. *stria*. In natural
STRÆTE, or } history, the small channels
STRÆTED, *adj.* } in the shells of cockles and
STRÆTURE, *n. s.* } scallops: formed in *stria*:
 disposition of *stria*.

These effluviæ fly by *striated* atoms and winding particles, as Des Cartes conceiveth; or glide by streams attracted from either pole unto the equator.

Browne's Vulgar Errors.

The salt, leisurely permitted to shoot of itself in the liquor, exposed to the open air, did shoot into more fair crystalline *stria* than those that were gained out of the remaining part of the same liquor by a more hasty evaporation.

Boyle.

Des Cartes imagines this earth once to have been a sun, and so the centre of a lesser vortex, whose axis still kept the same posture, by reason of the *striate* particles finding no fit pores for their passages, but only in this direction.

Ray.

Crystal, when incorporated with the fibrous talcs, shews, if broke, a *striated* or fibrous texture, like those talcs. *Woodward.*

Parts of tuberos hæmatitæ show several varieties in the crust, *striatum*, and texture of the body. *Id.*

STRIATED LEAF, among botanists, one that has a number of longitudinal furrows on its surface.

STRIATED LIMESTONE, a species or variety of indurated carbonate of lime. See **MINERALOGY**.

STRICK, *n. s.* Gr. *στρυξ*; Lat. *strix*. A bird of bad omen.

The ill-faced owl, death's dreadful messenger,
 The hoarse night-raven, trump of doleful drede,
 The leather-winged bat, day's enemy,
 The rueful *strick*, still waiting on the bier. *Spenser.*

STRICT, *adj.* } Lat. *strictus*. Exact;
STRICTLY, *adv.* } accurate; rigorously nice;
STRICTNESS, *n. s.* } confined; close; tight:
 the adverb and noun substantive corresponding.

As they took the compass of their commission *stricter* or larger, so their dealings were more or less moderate. *Hooker.*

Implore her, in my voice, that she make friends To the *strict* deputy.

Shakespeare. Measure for Measure.

These commissioners proceeded with such *strictness* and severity as did much obscure the king's mercy. *Bacon's Henry VII.*

His horse-troupes, that the vanguard had, he *strictly* did command

To ride their horses temperately.

Chapman.

I could not grant too much, or distrust too little to men that pretended singular piety and religious *strictness*.

King Charles.

Thou'lt fall into deception unaware,

Not keeping *strictest* watch.

Milton.

Thy will

By nature free, not over-ruled by fate

Inextricable, or *strict* necessity.

Id.

The god, with speedy pace,

Just thought to strain her in a *strict* embrace.

Dryden.

Charge him *strictly*

Not to proceed, but wait my farther pleasure. *Id.*

Such of them as cannot be concealed, connive at, though in the *strictness* of your judgment you cannot pardon. *Id.*

The other parts, being grosser, composed not only water, *strictly* so called, but the whole mass of liquid bodies. *Burnet.*

Who were made privy to the secrets of heaven, but such as performed his revealed will at an higher rate of *strictness* than the rest? *South.*

Vuma the rites of *strict* religion knew;

On ev'ry altar laid the incense due.

Prior.

Though in *strictness* our Saviour might have pleaded exemption from the Jewish tribute, he exerted his divine power in a miracle to pay it. *Rogers.*

The fatal noose performed its office, and with most *strict* ligature squeezed the blood into his face.

Arbuthnot.

We feel our fibres grow *strict* or lax, according to the state of the air. *Id.*

Eusebius, who is not in *strictness* to be reckoned with the Ante Nicenes. *Waterland.*

He checks the bold design;

And rules as *strict* his laboured works confine,

As if the Stagyrte o'erlooked each line. *Pope.*

STRICTURE, *n. s.* Lat. *strictura*. A spark; stroke; touch; contraction; or closure made by contraction.

Thus have I past through all your letter, and given myself the liberty of these *strictures*, by way of refection on all and every passage.

As long as there is thirst, with a free passage by urine, and *stricture* of the vessels, so long is water safely taken.

STRIDE, *n. s., v. n., & v. a.* Sax. *ŕæðoe*. A long or wide step; a step taken with violence: to walk with such steps: pass by a step.

I'll speak between the change of man and boy,
With a reed voice, and turn two mincing steps
Into a manly *stride*.

Shakspeare. Merchant of Venice.

The monster moved on with horrid *strides*.

Milton.

Mars in the middle of the shining shield
Is grav'd, and *strides* along the liquid field.

Dryden.

See him *stride*

Vallies wide.

Arbuthnot.

To Jove, or to thy father Neptune, pray,
The brethren cried, and instant *strode* away.

Pope.

Her voice theatrically loud,

And masculine her *stride*.

Swift.

STRIDONIUM, an ancient town of Hungary, famous for being the birth-place of St. Jerome, now called Strigova.

STRID'ULOUS, *adj.* Lat. *stridulus*. Making a small noise.

It arises from a small and *stridulous* noise, which, being firmly rooted, maketh a divulsion of parts.

Browne.

STRIFE, *n. s.* } From **STRIVE**, which see.
STRIFE'FUL, *adj.* } Contention; contest; discord; war: hence lawsuit; opposition of any kind: the adjective corresponding.

I and my people were at great *strife* with the children of Ammon.

Judges xii. 2.

Some preach Christ even of envy and *strife*, and some of good will.

Phil. i. 15.

He is proud, knowing nothing; but doating about questions and *strife* of words.

1 Tim. vi. 4.

The ape was *strife*ful and ambitious,
And the fox guileful and most covetous.

Spenser.

Artificial *strife*

Lives in those touches, livelier than life.

Shakspeare.

These acts of hateful *strife*, hateful to all,
How hast thou disturbed heaven's blessed peace!

Milton.

'Tis this that shakes our country with alarms,
And gives up Rome a prey to Roman arms,
Produces fraud, and cruelty, and *strife*.

Addison.

I know not what new creation may creep forth
from the *strife*ful heap of things, into which, as into
a second chaos, we are fallen.

Dr. Maine.

Inheriting no *strife*,

Nor marrying discord in a noble wife.

Pope.

Thus gods contended, noble *strife*!

Who most should ease the wants of life.

Congreve.

STRIGELIUS (Victorinus), a learned German divine, born in Suabia, in 1524. In 1542 he went to the university of Wirtemberg to inform himself of the opinions of the Protestants. He attended the lectures of Luther and Melancthon, and became such a master of their doctrines that he soon after read lectures himself. But in 1559 he was imprisoned for opposing some of the established theological doctrines. In 1562 he was liberated, on which he went to Leipsic; where he taught divinity, logic, and ethics; and published notes on the Psalter, and

other works. He died in 1569, aged only forty-five.

STRIG'MENT, *n. s.* Lat. *strigmentum*, from *stringo*, to scrape. Scraping; recreation.

Many, besides the *strigments* and sudorous adhesions from men's hands, acknowledging that nothing proceedeth from gold in its usual decoction.

Browne's Vulgar Errors.

STRIKE, *v. a., v. n., & n. s.* } *Pret.* I struck or
STRIK'ER, *n. s.* } strook; *part. pass.*

struck, strucken, stricken, or strook. Sax. *argþican*; Teut. *streichen*; Isl. *adstrykia*; Swed. *stryka*, Dan. *stricker*. To act upon, or hit with, a blow: hence to dash; to punish; afflict; stamp; note by a loud sound; lower; contract (applied particularly to sails); alarm; surprise; affect suddenly: to cause to sound by blows, taking up, emphatically; to forge; mint; conclude a bargain; taking the prepositions *off* and *out* as below: as a verb neuter, to make a blow or attack; collide; act by percussion; be dashed; pass with strong motion or effort; lower: 'to strike in with' is to conform; 'strike out', spread or rove: a strike is a measure of four pecks: striker, a person or thing that strikes.

Abraham and Sarah were old, and well *stricken* in age.

Genesis.

The blood *strike* on the two side-posts.

Exodus xii. 7.

Fearing lest they should fall into the quicksands, they *strake* sail, and so were driven.

Acts xxvii. 17.

A bishop then must be blameless, not given to wine, no *striker*.

1 Tim. iii. 3.

Wing, cartnave, and bushel, peck, *strike*, ready at hand.

Tusser's Husbandry.

He thought with his staff to have *struck* the *striker*.

Sandys.

The cunningest mariners were so conquered by the storm, as they thought it best with *stricken* sails to yield to be governed by it.

Sidney.

That shall I shew as sure as hound
The *stricken* deer doth challenge by the bleeding
wound.

Spenser.

Didst thou not see a bleeding hind,
Whose right haunch earst my stedfast arrows *strake*?

Id.

The drums presently *striking* up a march, they plucked up their ensigns, and forward they go.

Knolles.

The admiral galley, wherein the emperor was, *struck* upon a sand, and there stuck fast.

Id.

It pleased the king
To *strike* at me upon his misconstruction,
When he tript me behind.

Shakspeare, King Lear.

The Windsor bell hath *struck* twelve.

Shakspeare.

How many nobles then would hold their places,
That must *strike* sail to spirits of vile sort!

Id. Henry IV.

He that is *stricken* blind cannot forget
The precious treasure of his eyesight lost.

Shakspeare.

Strike up the drums, and let the tongue of war
Plead for our interest, and our being here.

Id.

The king
Is wise and virtuous, and his noble queen
Well *struck* in years; fair, and not jealous.

Id.

Deliver Helen, and all damage else
Shall be *struck* off.

Id. Troilus and Cressida.

Cæsar, 'tis *strucken* eight.

Shakspeare.

I'd rather chop this hand off at a blow,
And with the other fling it at thy face,
Than bear so low a sail, to *strike* to thee.

Id.

The court paved *strieth* up a great heat in summer, and much cold in winter. *Bacon.*

Holding a ring by a thread in a glass, tell him that holdeth it, it shall *strike* so many times against the side of the glass, and no more. *Id. Natural History.*

Parker and Vaughan, having had a controversy touching certain arms, were appointed to run some courses, when Parker was *stricken* into the mouth at the first course. *Bacon.*

Though the earl of Ulster was of greater power than any other subject in Ireland, yet was he so far *stricken* in years as that he was unable to manage the martial affairs *Davies.*

The *striker* must be dense, and in its best velocity. *Digby.*

These men are fortune's jewels, moulded bright,
Brought forth with their own fire and light;
If I her vulgar stone for ether took,
Out of myself it must be *struck*. *Cowley.*

Waving wide her myrtle wand,
She *strikes* an universal peace through sea and land. *Milton.*

By expurgatory animadversions, we might *strike* out great numbers of hidden qualities; and, having once a conceded list, with more safety attempt their reasons. *Browne.*

The rest *struck* with horror stood,
To see their leader covered o'er with blood. *Waller.*

Those antique minstrels, sure, were Charles-like kings,

Cities their lutes, and subjects' hearts their strings;
On which so divine a hand they *strook*,
Consent of motion from their breath they took. *Id.*

That conquering look,
When next beheld, like lightning *strook*
My blasted soul, and made me bow. *Id.*

To this all differing passions and interests should *strike* sail, and, like swelling streams running different courses, should yet all make haste into the sea of common safety. *Temple.*

They *strike* sail where they know they shall be mastered, and murder where they can with safety. *Dryden.*

Sign but his peace, he vows he'll ne'er again
The sacred names of fops and beaux profane:
Strike up the bargain quickly; for I swear,
As times go now, he offers very fair. *Id.*

Jack Straw at London-stone, with all his rout,
Struck not the city with so loud a shout. *Id.*

Take my caduceus!

With this 'he infernal ghosts I can command,
And *strike* a terror through the Stygian strand. *Id.*

So ceased the rival crew, when Purcell came,
They sung no more, or only sung his fame;
Struck dumb they all admired. *Id.*

He withered all their strength before he *strook*. *Id.*

When, by their designing leaders taught
To *strike* at power which for themselves they sought,
The vulgar, gulled into rebellion, armed,
Their blood to action by their prize was warmed. *Id.*

Now and then a glittering beam of wit and passion
strikes through the obscurity of the poem: any of these effect a present liking, but not a lasting admiration. *Id.*

He, like a patient angler, ere he *strook*,
Would let them play awhile upon the hook. *Id.*

The memory in some men is very tenacious; but yet there seems to be a constant decay of all our ideas, even of those which are struck deepest, and in minds the most retentive. *Locke.*

Consider the red and white colors in porphyry;
hinder light but from *striking* on it, and its colours vanish. *Id.*

Deep thoughts will often suspend the senses so far that about a man clocks may *strike*, and bells ring, which he takes no notice of. *Greiv.*

They catch at every shadow of relief, *strike* in at a venture with the next companion, and, so the dead commodity be taken off, care not who be the champion. *Norris.*

Those who, by the prerogative of their age, should frown youth into sobriety, imitate and *strike* in with them, and are really vicious that they may be thought young. *South.*

When any wilful sin stands charged on our account, it will not be *struck* off till we forsake and turn away from it. *Kettleworth.*

In this plain was the last general rendezvous of mankind; and from thence they were broken into companies, and dispersed; the several successive generations, like the waves of the sea, over-reaching one another, and *striking* out farther and farther upon the land. *Burnet's Theory.*

A mass of water would be *struck* off and separate from the rest, and tossed through the air like a flying river. *Burnet.*

Though they the lines on golden anvils beat,
It looks as if they *struck* them at a heat. *Tate.*

His virtues render our assembly awful,
They *strike* with something like religious fear. *Addison's Cato.*

Then do not *strike* him dead with a denial,
But hold him up in life. *Id.*

He immediately *struck* in with them; but described this march to the temple with so much horror that he shivered every joint. *Id. Freeholder.*

It *struck* on a sudden into such reputation, that it scorns any longer to sculk, but owns itself publicly. *Government of the Tongue.*

Nice works of art *strike* and surprise us most upon the first view; but, the better we are acquainted with them, the less we wonder. *Atterbury.*

Some very-rare coins, *struck* of a pound weight of gold and silver, Constantius sent to Chilperick. *Arbuthnot.*

Ask men's opinions: Scoto now shall tell
How trade increases, and the world goes well:
Strike off his pension by the setting sun,
And Britain, if not Europe is undone. *Pope.*

The interest of our kingdom is ready to *strike* to that of your poorest fishing towns: it is hard you will not accept our services. *Swift.*

STRIKING, sometimes called pithing of animals, in rural economy, is a method of suddenly slaughtering or killing them for domestic purposes, by the use of a small sharp spear-pointed knife struck in so as to divide the spinal marrow, instead of the more protracted and cruel practice of knocking them on the heads, and breaking and mashing the parts by means of the hammer-headed axe, as is generally the custom, to the great danger of the operator, and the disgust of the spectator. It is desirable, on several accounts, that this sudden mode of killing neat cattle, and other sorts of animals, by striking into and dividing this vital part, should become the common one; and especially as removing the apparent cruelty, and lessening the sufferings of them more than in the other or ordinary practice. This method, which has long been universal, in a great measure, on the continent, especially in Portugal, Spain, and some other parts, as well as in some of the West Indian islands in our possession, has, within these few years, been tried in this country, in some instances, with

complete success; and the flesh of the beasts so killed has been found equally good, if not better, than that of those slaughtered in the usual manner. All accidents and bruises are avoided, which not uncommonly take place in forcing them into a proper situation and position for receiving the stroke or blow, when they are to be knocked down and killed in that way.

It has been stated, by the writer of the Report of the Agriculture of Shropshire, that a butcher in Lincolnshire practised this mode several years ago, in consequence of the representations made to him of it by captain Clarkson of the navy, who had seen animals so slaughtered for the use of our fleet when at Jamaica: and this practice obtains pretty generally on the Lincolnshire side or bank of the Humber river, as at Barton, and several other places. Calves, sheep, pigs, and other animals, are stated to have been killed in the same manner. Still the want of due precision in the manner of performing the operation has prevented, or thrown some doubt upon its utility, especially in so far as tenderness and humanity towards the animal are concerned; for though the beast may be managed completely by this mode, yet, without sufficient correctness and exactness in its execution, it is not so certain that its sense of feeling may be wholly destroyed. Indeed the contrary would seem to be the case, from the ingenious enquiries and experimental trials of Dr. Du Gard of Shrewsbury, who has shown that, though the spinal marrow may be divided, the nerves that supply the organs of respiration and most of the senses remain uninjured. But if the division be made sufficiently high up towards the cavity of the skull, so as to separate the medullary substance above the origin of the nerves which supply the diaphragm, it would appear, from the equally ingenious and correct experiments of others, as Hunter, Home, &c., that the animals may instantly be killed in the most certain and effectual manner; and that, by performing this operation in the same way, it will be attended with constant and perfect success. It is not improbable, indeed, that an instrument might be contrived by means of a strong spring, somewhat in the manner of that used in cupping, but only with one blade, that might, on being properly applied, force itself suddenly into the brain even, and thus instantly complete the business; or the operation might probably be performed in an equally complete, convenient, and more expeditious manner, by the discharge of a small pistol, loaded in some proper way for this purpose, and suitably directed.

STRING, *n. s. & v. a.* } Saxon *færing*; Belg.
STRING'ED, *adj.* } *string*; Dan. *stringhe*;
STRING'HALT, *n. s.* } Lat. *stringo*. A slender
STRING'LESS, *adj.* } rope or cord; any slender
STRING'Y. } and flexible band; a musical chord; small fibre; any thing connected by a band; the line of a bow: 'to have two strings to one's bow,' is to have two expedients or resources: 'to string is to furnish with or file on a string: to tune or fit up a stringed instrument; string-halt is defined below: the adjective follows the sense of the noun substantive.

Praise him with *stringed* instruments and organs.
Psalms.

The wicked bend their bow, they make ready their arrows upon the *string*.
Id. xi. 2.

The *string* of his tongue loosed. *Mark* xxvii. 35.

Nothing; all is said;
His tongue is now a *stringless* instrument,
Words, life, and all, old Lancaster hath spent.

Shakespeare.

The most pitious tale, which in recounting,
His grief grew puissant, and the *strings* of life
Began to crack. *Id.* *King Lear.*

Duckweed putteth forth a little *string* into the water, from the bottom. *Bacon.*

Any lower bullet, hanging upon the other above it, must be conceived as if the weight of it were in that point where its *string* touches the upper.

Wilkins's Dædalus.

Thus when two brethren *strings* are set alike,
To move them both but one of them we strike.

Cowley.

Divinely warbled voice
Answering the *stringed* noise,
As all their souls in blissful rapture took. *Milton.*

No lover has that power
To enforce a desperate amour,
As he that has two *strings* to 's bow,
And burns for love and money too.

Hudibras.

Their priests pray by their beads, having a *string* with a hundred of nutshells upon it; and the repeating of certain words with them they account meritorious.

Stillingfleet.

Toil *strung* the nerves, and purified the blood.

Dryden.

In pulling broom up, the least *strings* left behind will grow.

Mortimer's Husbandry.

A plain Indian fan, made of the small *stringy* parts of roots spread out in a round flat form. *Grew.*

The *string* that jars

When rudely touched, ungrateful to the sense,
With pleasure feels the master's flying fingers,
Swells into harmony, and charms the hearers.

Rowe.

I have caught two of these dark undermining vermin, and intend to make a *string* of them, in order to hang them up in one of my papers.

Addison's Spectator.

By the appearance they make in marble, there is not one *string* instrument that seems comparable to our violins.

Addison.

Here the muse so oft her harp has *strung*,
That not a mountain rears its head unsung. *Id.*

Men of great learning or genius are too full to be exact; and therefore chuse to throw down their pearls in heaps before the reader, rather than be at the pains of *stringing* them. *Spectator.*

Round Ormond's knee thou tust the mystick *string*,

That makes the knight companion to the king.

Prior.

By melting, expensive sweats, and an obstinate flux of the belly, the *stringy* parts of the tendons and members are left unrecruited. *Blackmore.*

Has not wise nature *strung* the legs and feet,
With firmest nerves, designed to walk the street?

Gay.

The *strung* bow points out the Cynthian queen.

Id.

Th' impetuous arrow whizzes on the wing,
Sounds the tough horn, and twangs the quiv'ring *string*.

Pope.

Stringhalt is a sudden twitching and snatching up of the hinder leg of a horse much higher than the other, or an involuntary or convulsive motion of the muscles that extend or bend the hough.

Furrier's Dictionary.

STRIP, *v. a., v. n., & n. s.* Saxon *berþrīpe*, stripped; Belgic *streoren*; Isl. *strypp*, is naked. To make naked; deprive of covering; (with *off* before the thing taken away); divest; rob; plunder; peel; take off covering; cast off: a narrow shred.

They *stript* Joseph out of his coat.

Gen. xxxvii. 23.

He *stript off* his cloaths.

1 Sam. xix. 24.

They began to *strip* her of her cloaths when I came in among them.

Sidney.

The apostle, in exhorting men to contentment, although they have in this world no more than bare food and raiment, giveth us to understand that those are even the lowest of things necessary; that if we should be *stript* of all these things, without which we might possibly be, yet these must be left.

Hooker.

His unkindness,

That *stript* her from his benediction, turned her

To foreign casualties, gave her dear rights

To his doghearted daughters: these things sting him.

Shakspeare.

Scarce credible it is how soon they were *stript* and laid naked on the ground.

Hayward.

Now this curious built Phæacian ship, Returning from her convoy, I will *strip* Of all her fleeting matter.

Chapman.

We *strip* and divest ourselves of our own will, and give ourselves entirely up to the will of God.

Duppa.

Hadst thou not committed

Notorious murder on those thirty men

At Askelon, who never did thee harm,

Then like a robber *stripp'dst* them of their robes.

Milton.

If the leaves or dried stocks be *stripped* into small straws, they arise unto amber, wax, and other electrics, no other ways than those of wheat or rye.

Broune's Vulgar Errors.

A rattling tempest through the branches went,

That *stript* them bare.

Dryden's Knight's Tale.

He left the pillagers, to rapine bred,

Without controul to *strip* and spoil the dead.

Dryden.

You cloath all that have no relation to you, and *strip* your master that gives you food.

L'Estrange.

It is difficult to lead another by words into the thoughts of things, *stripped* of those specifick differences we give them.

Locke.

Amongst men who examine not scrupulously their own ideas, and *strip* them not from the marks men use for them, but confound them with words, there must be endless disputes.

Id.

That which lays a man open to an enemy, and that which *strips* him of a friend, equally attacks him in all those interests that are capable of being weakened by the one, and supported by the other.

South.

When some fond easy fathers *strip* themselves before they lie down to their long sleep, and settle their whole estates upon their sons, has it not been seen that the father has been requited with beggary?

Id.

One would imagine these to be the expressions of a man blessed with ease and affluence, not of one just *stript* of all those advantages, and plunged in the deepest miseries, and now sitting naked upon a dunghill.

Atterbury.

The bride was put in form to bed;

He followed, *stript*.

Swift.

These two apartments were hung in close mourning, and only a *strip* of bays round the other rooms.

Id.

Logick helps us to *strip off* the outward disguise of

things, and to behold and judge of them in their own nature.

Watts.

STRIPE, *n. s.* Belg. *strepe*; Dan. *stribe*. A lineary variation of color; a streak. This seems to be the original notion of the word: a shred of different color: a weal or discoloration by a lash: hence a lash; a blow.

Gardeners may have three roots, among an hundred, that are rare, as purple and carnation of several stripes.

Bacon.

A body cannot be so torn with stripes, as a mind with remembrance of wicked actions.

Hayward.

To those that are yet within the reach of the stripes and reproofs of their own conscience, I would address that they would not seek to remove themselves from that wholesome discipline.

Decay of Piety.

One of the most valuable trimmings of their cloaths was a long stripe sowed upon the garment, called *latus clavus*.

Arbuthnot.

Cruelty marked him with inglorious stripes.

Thomson.

STRIP'LING, *n. s.* Probably from Strip, a shred. A youth; one in the state of adolescence; a slender young man.

'Thwart the lane,

He, with two *striplings*, lads more like to run

The country base than to commit such slaughter,

Made good the passage.

Shakspeare. Cymbeline.

Now a *stripling* cherub he appears,

Not of the prime, yet such as in his face

Youth smiled celestial.

Milton's Paradise Lost.

Compositions on any important subjects are not matters to be wrung from poor *striplings*; like blood out of the nose, or the plucking of untimely fruit.

Id. On Education.

As when young *striplings* whip the top for sport,

On the smooth pavement of an empty court,

The wooden engine whirls.

Dryden's Æneid.

As every particular member of the body is nourished with a several qualified juice, so children and *striplings*, old men and young men, must have divers diets.

Arbuthnot on Aliments.

STRIVE, *v. n.* Pret. I strove, anciently I strived; *part. pass.* striven. Sax. *strēpōð*; Belg. *streven*; Teut. *streben*; Fr. *estriver*. To struggle; labor; make an effort; contest; vie; emulate.

Strive for the truth unto death.

Eclus iv. 28.

Why dost thou *strive* against him?

Job xxxiii. 13.

Strive with me in your prayers to God for me.

Romans xv.

So have I *strived* to preach the gospel.

Id. xv. 20.

Charge them that they *strive* not about words, to no profit.

2 Timothy ii. 14.

Many brave young minds have, through hearing the praises and eulogies of worthy men, been stirred up to affect the like commendations, and so *strive* to the like deserts.

Spenser.

The immutability of God they *strive* unto, by working after one and the same manner.

Hooker.

Do as adversaries do in law;

Strive mightily, but eat and drink as friends.

Shakspeare.

Was it for this that Rome's best blood he spilt,

With so much falsehood, so much guilt?

Was it for this that his ambition strove

To equal Cæsar first, and after Jove?

Cowley.

Now private pity strove with publick hate,

Reason with rage, and eloquence with fate.

Denham.

Not that sweet grove
Of Daphne by Orontes, and the inspired
Castalian spring, might with this paradise
Of Eden strive.

Milton.

Thus does every wicked man that contemns God;
who can save or destroy him who strives with his
Maker?

Tillotson.

If intestine broils alarm the hive,
For two pretenders oft for empire strive,
The vulgar in divided factions jar,
And murmur'ing sounds proclaim the civil war.

Dryden.

This is warrantable conflict for trial of our faith;
so that these *strivings* are not a contending with
superior powers.

L'Estrange.

Our blessed Lord commands you to *strive* to enter
in; because many will fail, who only seek to enter.

Law.

These thoughts he *strove* to bury in expence,
Rich meats, rich wines, and vain magnificence.

Harte.

STRIVALI (the ancient Strophades), a cluster
of islands of the Ionian Sea, on the west coast of
the Morea, four in number. The largest, the
abode, according to the poets, of the harpies,
abounds in olives and other fruit, but does not
produce corn enough for its limited population.
The smallest is little else than a rock, and the
two others form a kind of small harbour. Twenty-
six miles south of Zante.

STRIX, the owl, in ornithology, a genus be-
longing to the order of accipitres. The bill is
hooked, but has no cere or wax; the nostrils are
covered with setaceous feathers; the head is very
large, as are also the ears and eyes; and the
tongue is bifid. There are forty-six species; the
most remarkable are, 1. *S. brachyotos*, the
short-eared owl, is fourteen inches long; three
feet broad; the head is small and hawk-like; the
bill is dusky; weight fourteen ounces; the circle
of feathers that immediately surrounds the eyes
is black; the larger circle white, terminated with
tawny and black; the feathers on the head, back,
and coverts of the wings, are brown, edged with
pale dull yellow; the breast and belly are of the
same color, marked with a few long narrow streaks
of brown pointing downwards; the quill-feath-
ers are dusky, barred with red; the tail is of
a very deep brown, adorned on each side of the
shaft of the four middle feathers with a yellow
circle which contains a brown spot; the tip of
the tail is white. The horns of this species are
very small, and each consists of only a single
feather; these it can raise or depress at pleasure;
and in a dead bird are with difficulty discovered.
This kind is scarce; and is a solitary bird, avoid-
ing inhabited places. This species may be called
long-winged owls, the wings when closed reach-
ing beyond the end of the tail; whereas in the
common kinds they fall short of it. They are
birds of passage, and have been observed to visit
Lincolnshire in the beginning of October, and to
retire early in the spring; so probably, as they
perform their migrations with the woodcock,
their summer retreat is Norway. During day,
they lie hid in long old grass; when disturbed,
seldom fly far, but will light, and sit looking at
one, when the horns may be seen very distinctly.
They do not perch on trees like other owls.
They usually fly in search of prey in cloudy hazy

weather. Farmers are fond of seeing these birds
in the fields, as they clear them from mice. They
are found frequently on the hill of Hoy in the
Orkneys, where they fly about and prey by day
like hawks. They are found also in Lancashire,
and in New England and Newfoundland.

2. *S. bubo*, the great eared owl, in size is al-
most equal to an eagle. Irides bright yellow;
head and whole body finely varied with lines,
spots, and specks of black, brown, cinereous, and
ferruginous. Wings long; tail short, marked
with dusky bars. Legs thick, covered to the
very end of the toes with a close and full down
of a testaceous color. Claws great, much
hooked, and dusky. They have been shot in
Scotland and in Yorkshire. They inhabit inac-
cessible rocks and desert places; and prey on
hares and feathered game. Their appearance in
cities was deemed an unlucky omen; Rome it-
self once underwent a lustration because one of
them strayed into the capitol. The ancients held
them in the utmost abhorrence; and thought
them, like the screech-owls, the messengers
of death. Pliny styles it *bubo funebris*, and
noctis monstrum.

3. *S. Cayennensis*, the spectacle owl of Ca-
yenne, which is accurately described by Dr. La-
tham, is twenty-one inches in length: the upper
parts of the body are of a reddish color; the
lower parts of a rufous white: the head and neck
are white, and not so full of feathers as those of
owls generally are, and from this circumstance
it appears not unlike a hawk: a large patch of
dark brown surrounds each eye, giving the bird
much the appearance of wearing spectacles;
the legs are covered with feathers quite to the
toes, and are of a yellowish color. A specimen
of this curious bird may be seen in the Leverian
museum.

4. *S. flammea*, the common white owl. The
elegant plumage of this bird makes amends for
the uncouthness of its form: a circle of soft
white feathers surrounds the eyes. The upper
part of the body, the coverts, and secondary feath-
ers of the wings, are of a fine pale yellow: on
each side of the shafts are two gray and two
white spots, placed alternately; the exterior sides
of the quill feathers are yellow; the interior
white, marked on each side with four black spots;
the lower side of the body is wholly white; the
interior sides of the feathers of the tail are white;
the exterior marked with some obscure dusky
bars; the legs are feathered to the feet: the feet
are covered with short hairs: the edge of the
middle claw is serrated. The usual weight is
eleven ounces; its length fourteen inches; its
breadth three feet. This species is almost do-
mestic; inhabiting, for the greatest part of the
year, barns, hay lofts, and other out-houses; and
are as useful in clearing those places from mice
as the congenial cat: towards twilight they quit
their perch, and take a regular circuit round the
fields, skimming along the ground in quest of
field mice, and then return to their usual resi-
dence: in the breeding season they take to the
eaves of churches, holes in lofty buildings, or
hollows of trees. During the time the young
are in the nest, the male and female alternately
sally out in quest of food, make their circuit,

beat the fields with the regularity of a spaniel, and drop instantly on their prey in the grass. They seldom stay out above five minutes; return with their prey in their claws; but as it is necessary to shift it into their bill, they always alight for that purpose on the roof, before they attempt to enter their nest. This species do not hoot, but snore and hiss in a violent manner; and, while they fly along, will often scream most tremendously. Their only food is mice. As the young of these birds keep their nest for a great length of time, and are fed even long after they can fly, many hundreds of mice will scarcely suffice to supply them with food. Owls cast up the bones, fur, or feathers of their prey, in form of small pellets, after they have devoured it, as hawks do. A gentleman, on grubbing up an old pollard ash that had been the habitation of owls for many generations, found at the bottom many bushels of this rejected stuff. Some owls, when they are satisfied, hide the remainder of their meat like dogs.

5. *S. otus*, the long eared owl, is found, though not frequently, in the north of England, in Cheshire, and in Wales. Mr. Hasselquist saw it alive in Cairo, and it is not unfrequent all over Egypt. Its weight, according to Dr. Latham, is nine ounces; the length fourteen inches and a half; the breadth thirty-four; the irides are of a bright yellow; the bill black; the breast and belly are of a dull yellow, marked with slender brown strokes pointing downwards; the thighs and vent-feathers of the same color, but unspotted. The back and coverts of the wing are varied with deep brown and yellow; the quill feathers of the same color, but near the ends of the outmost is a broad bar of red; the tail is marked with dusky and reddish bars, but beneath appears ash-colored; the horns or ears are about an inch long, and consist of six feathers variegated with yellow and black; the feet are feathered down to the claws.

6. *S. passerina*, the little owl, is very rare in England; it is sometimes found in Yorkshire, Flintshire, and also near London: in size it scarcely exceeds a thrush, though the fulness of its plumage makes it appear larger: the irides are of a light yellow; the bill of a paper color; the feathers that encircle the face are white tipped with black; the head brown, spotted with white; on the breast is a mixture of white and brown; the belly is white, marked with a few brown spots; the tail of the same color with the back; in each feather barred with white; in each adorned with circular white spots, placed opposite to one another on both sides of the shaft; the legs and feet are covered with feathers down to the claws. The Italians make use of this owl to decoy small birds to the limed twig; the method of which is exhibited in Olin's *Uccelliera*, p. 65. Mr. Stuart, author of the *Antiquities of Athens*, informed Mr. Pennant that this species of owl was very common in Attica; that they were birds of passage, and appeared there in the beginning of April in great numbers; that they bred there; and that they retired at the same time as the storks, whose arrival they a little preceded.

7. *S. stridula*, the tawny owl. The female of

this species weighs nineteen ounces; the length is fifteen inches; the breadth two feet eight inches; the irides are dusky; the ears in this, as in all owls, very large; and their sense of hearing very exquisite. The color of this kind is sufficient to distinguish it from every other: that of the back, head, coverts of the wings, and on the scapular feathers, being a fine tawny red, elegantly spotted and powdered with the black or dusky spots of various sizes: on the coverts of the wings, and on the scapulars, are several large white spots: the coverts of the tail are tawny, and quite free from any marks: the tail is variously blotched, barred, and spotted with pale red and black; in the two middle feathers the red predominates; the breast and belly are yellowish, mixed with white, and marked with narrow black strokes pointing downwards: the legs are covered with feathers down to the toes. This is a hardier species than the *Flammea*; and the young will feed on any dead thing, whereas those of the white owl must have a constant supply of fresh meat. It is the strix of *Aldrovandus*, and what we call the screech-owl, or lich owl, to which the folly of superstition had given the power of presaging death by its cries. The ancients believed that it sucked the blood of young children: a fact some think not incredible; for Hasselquist describes a species found in Syria, which frequently in the evening flies in at the windows, and destroys the helpless infant. See *Ovid. Fast.* vi. 135.

8. *S. ulula*, the brown owl, agrees with the former in its marks; differing only in the colors: in this the head, wings, and back, are of a deep brown, spotted with black in the same manner as the former; the coverts of the wings and the scapulars are adorned with similar white spots; the exterior edges of the four first quill feathers in both are serrated: the breast in this is of a very pale ash color mixed with tawny, and marked with oblong jagged spots: the feet too are feathered down to the very claws: the circle round the face is ash-colored, spotted with brown. Both these species inhabit woods, where they reside the whole day: in the night they are very clamorous; and, when they hoot, their throats are inflated to the size of a hen's egg. In the dusk they approach our dwellings; and will frequently enter pigeon-houses, and make great havoc in them. They destroy numbers of little leverets, as appears by the legs frequently found in their nests. They also kill abundance of moles, and skin them with as much dexterity as a cook does a rabbit. They build in hollow trees or ruined edifices; lay four eggs, of an elliptic form, and of a whitish color.

STROGONOFF (count Alexander de), a Russian nobleman, born about the middle of the eighteenth century, received a good education, and in his youth displayed a strong taste for French literature. Several years which he passed at Paris doubtless occasioned this partiality; returning to St. Petersburg, he was nominated president of the Academy of the Fine Arts, and made a noble use of his immense riches, by giving an asylum in his palace to authors and artists, and by forming a valuable collection of paintings, medals, and engravings, and a rich li-

brary. He died at Petersburg, September 27th, 1811.

STROGONOFF (count Paul), nephew of the above, entered into the army, and served in Austria in 1805, and in Prussia in 1807, when he was made adjutant major-general. He was afterwards employed against the Swedes in Finland, and against the Turks in Moldavia; and after being engaged against the French, in the campaigns of 1812 and 1813, was killed under the walls of Laon, in February 1814.

STROGONOFF (baron Alexander de), born in 1772, displayed an early genius for learning and the arts, and travelled in Germany, France, and Italy. He published at Geneva, in 1809, two volumes of Letters to his Friends, written with great taste, to which were added two remarkable little pieces, entitled The History of the Chevaliers de la Vallée: and the History of Pauline Dupuis. The baron then labored under a state of blindness and debility, which did not, however, disturb the tranquillity of his mind. His death took place in September, 1815.

STROKE, *n. s. & v. a.* From strook, the preterite of strike. A blow; knock; hostile blow or act; sudden act of one body upon another; sudden disease; sound of a clock; touch; power; efficacy.

He, hoodwinked with kindness, least of all men knew who stroke him. *Sidney.*

As cannons overcharged with double cracks, So they redoubled strokes upon the foe. *Shakspeare.*

What is 't o'clock?
—Upon the stroke of four. *Id. Richard III.*

Take this purse, thou whom the heavens' plagues Have humbled to all strokes. *Id. King Lear.*

The oars were silver,
Which to the tune of flutes kept stroke, and made
The water which they beat to follow faster,
As amorous of their strokes. *Id. Antony and Cleopatra.*

He entered, and won the whole kingdom of Naples, without striking a stroke. *Bacon.*

These having equal authority for instruction of the young prince, and well agreeing, bare equal stroke in divers faculties. *Hayward.*

He was taken prisoner by Surinas, lieutenant-general for the king of Parthia, who stroke off his head. *Hakewill.*

Perfectly opacous bodies can but reflect the incident beams; those that are diaphanous refract them too, and that refraction has such a stroke in the production of colours generated by the trajectory of light through drops of water, that exhibit a rainbow through divers other transparent bodies. *Boyle.*

Then on the crowd he cast a furious look,
And withered all their strength before he strook. *Dryden.*

Both were of shining steel, and wrought so pure,
As might the strokes of two such arms endure. *Id.*

He has a great stroke with the reader, when he condemns any of my poems, to make the world have a better opinion of them. *Id.*

Another in my place would take it for a notable stroke of good breeding, to compliment the reader. *L'Esrange.*

The subtle effluvia of the male seed have the greatest stroke in generation. *Ray.*

As he purchased the first success in the present war, by forcing into the service of the confederates an army that was raised against them, he will give

one of the finishing strokes to it, and help to conclude the great work. *Addison.*

A verdict more puts me in possession of my estate; I question not but you will give it the finishing stroke. *Arbuthnot.*

Oh lasting as those columns may they shine!
Free as thy stroke, yet faultless as thy line. *Pope.*

I had a long design upon the ears of Curl; but the rogue would never allow me a fair stroke at them, though my penknife was ready. *Swift.*

At this one stroke the man looked dead in law;
His flatterers scamper, and his friends withdraw. *Harte.*

Isidore's collection was the great and bold stroke, which in its main parts has been discovered to be an impudent forgery. *Baker on Learning.*

STROKE, *v. a.* Sax. *ƿracan*. To rub gently with the hand by way of kindness or endearment; to sooth.

The senior weaned his younger shall teach,
More stroken and made of when aught it doth aile
More gentle ye make it for yoke or the paille. *Tusser.*

Thus children do the silly birds they find
With stroaking hurt, and too much cramming kill. *Sidney.*

Thy praise or dispraise is to me alike,
One doth not stroke me, nor the other strike. *Ben Jonson.*

He set forth a proclamation, stroaking the people with fair promises, and humouring them with incentives against the king and government. *Bacon.*

He dried the falling drops, and, yet more kind,
He stroked her cheeks. *Dryden.*

She plucked the rising flowers, and fed
The gentle beast, and fondly stroaked his head. *Addison.*

When the big-uddered cows with patience stand,
Waiting the strokings of the damsel's hand. *Gay.*

STROKING, or rubbing gently with the hand, a method which has been employed by some persons for curing diseases. Mr. Greatrakes, or Greatrix, the famous Irish stroker, is said to have performed many wonderful cures. But, if they really were effected, they are most undoubtedly to be attributed to the imagination of the patient, rather than the operation of the practitioner.

STROLL, *v. n.* } Fr. *rouler*; qu. Lat. *extra*
STROLL'ER, *n. s.* } and *roll*. To wander; ramble; rove; be a vagrant: the noun substantive corresponding.

'Tis she who nightly strowls with sauntering pace. *Gay.*

She's mine, and thine, and strolling up and down. *Granville.*

Your wine locked up, your butler strolled abroad. *Pope.*

These mothers stroll, to beg sustenance for their helpless infants. *Swift.*

Two brother-hermits, saints by trade,
Disguised in tattered habits went
To a small village down in Kent;
Where, in the stroller's canting strain,
They begged from door to door in vain. *Id.*
The men of pleasure, who never go to church,
form their ideas of the clergy from a few poor strollers
they often observe in the streets. *Id.*

STROMATEUS, in ichthyology, a genus of fishes belonging to the order of apodes. The head is compressed; the teeth are placed in the jaws and palate; the body is oval and slippery;

and the tail is forked. There are three species : 1. *S. cumarca*; 2. *S. fiatola*; 3. *S. paru*; according to Dr. Gmelin.

STROMBOLI, the most northerly of the Lipari islands, in the Mediterranean, belonging to Naples. Though small it produces very good wine, and the climate is mild and pleasant. The inhabitants derive their subsistence partly from fishing, partly from the cultivation of fruits. Stromboli has from time immemorial been remarkable for its volcano, the only one, perhaps, whose fires are in a state of incessant activity. Its mountain has two summits, one of great height, but the crater is on its side. The eruptions last for a few moments, but, recurring at short intervals, the flames are seen by night, at a great distance, and are of considerable service to navigators. It is called sometimes the great light-house of the Mediterranean. The matter thrown out consists of lava, ashes, and stones; and each eruption is attended with an explosive noise. Sixteen miles N. N. E. of Lipari, and thirty-four north of Melazzo, in Sicily.

STROMBUS, in natural history, a genus of vermes, belonging to the order of testacea. The animal is a linax; the shell is univalve and spiral; the opening is much dilated, and ends in a canal which turns to the left. Gmelin enumerates fifty-three species; of which only one is peculiar to Britain, viz. *S. pes pelicani*. The spires are ten; the lip is fingered; the point very sharp; the length two inches.

STROMOE, the largest of the Faroe Islands, is situated in the centre of the group, and is about thirty miles in length, and six in breadth. It is deeply indented by bays and creeks, some of which form good harbours, particularly that of Westmanskavn. fit for the reception of vessels of any size. The coast presents a series of sublime scenery, the rocks rising in bold cliffs, almost perpendicular to the water, and forming in many places lofty detached columns: often are they hollowed so as to form immense caverns; and in some cases they are completely perforated, and afford a passage for boats. In the interior is the mountain called Skieling Field, which rises to a perpendicular height of 3000 feet. The population of this and the neighbouring island, Nalsole, is about 1600; subsisting, as in the other Faroe Isles, by fishing, cultivating a little corn, and rearing cattle, but depending on Denmark for annual supplies. In 1812 the number of horned cattle was 600, of sheep 9000, and of fishing-boats 150. The chief town is Thorshaven.

STROMSTADT, a small town in West Gothland, Sweden, celebrated for its shell-fish, particularly lobsters. It lies in a hilly district, contains 1100 inhabitants, and has a good harbour. Forty-three miles N. N. W. of Uddevalla. Long. 11° 12' E., lat. 58° 55' 30" N.

STROND, *n. s.* For strand. The beach; the bank of the water. Obsolete.

So looks the *strond* whereon the' imperious flood Hath left a witnessed usurpation. *Shakspeare.*

STRONG, *adj.* Sax. *strang*. Vigorous; **STRONGFISTED**, } forceful; of great power
STRONGHAND, *n. s.* } or ability; ardent; eager;
STRONGLY, *adv.* } full; potent; valid; con-
STRONGWATER, *n. s.* } firmed; cogent: the ad-

verb corresponding: the compounds of obvious meaning.

That our oxen may be *strong* to labour.

Psalms cxlv. 14.

While there was war between the houses of Saul and David, Abner made himself *strong* for Saul.

2 Sam. iii. 6.

Let the foundations be *strongly* laid. *Ezra* vi. 3.
 Produce your cause; bring forth your *strong* reasons.

Isaiah.

In the days of his flesh he offered up prayers, with *strong* crying and tears.

Heb. v. 7.

Strong meat belongeth to them that are of full age.

Hebrews.

In process of time, an ungodly custom grown *strong* was kept as a law.

Wisdom xiv. 16.

Better is the poor, being sound and *strong* in constitution, than a rich man afflicted in his body.

Ecclesi. xxx. 14.

Though 'gan the villain wax so fierce and *strong*

That nothing may sustain his furious force,

He cast him down to ground, and all along

Drew him through dirt and mire.

Spenser.

When their captain dieth, if the senyory should descend to his child, and an infant, another would thrust him out by *stronghand*, being then unable to defend his right.

Id.

There is no English soul

More *stronger* to direct you than yourself,

If with the sap of reason you would quench,

Or but allay, the fire of passion.

Shakspeare. Henry VIII.

Messengers

Of *strong* prevailment in unhardened youth.

Shakspeare.

Within Troy's *strong* immures

The ravished Helen with wanton Paris sleeps. *Id.*

The *strong*-winged Mercury should fetch thee up
 And set thee by Jove's side.

Id. Antony and Cleopatra.

When he was not six-and-twenty *strong*,

Sick in the world's regard, wretched and low,

My father gave him welcome to the shore.

Id. Henry IV.

All those accuse him *strongly*.

Shakspeare.

Great Dunsinane he *strongly* fortifies.

Id.

Her mother, ever *strong* against that match,

And firm for doctor Caius, hath appointed

That he shall shuffle her away.

Id.

They wanting land wherewith to sustain their people, and the Tuscans having more than enough, it was their meaning to take what they needed by *stronghand*.

Raleigh.

An army of English engaged between an army of a greater number, fresh and in vigour on the one side, and a town *strong* in fortification, and *strong* in men, on the other.

Bacon.

The colewort is an enemy to any plant, because it draweth *strongly* the fattest juice of the earth. *Id.*

He was, at his rising from Exeter, between six and seven thousand *strong*.

Id.

This is one of the *strongest* examples of a personation that ever was.

Id.

In choice of committees for ripening business for the council, it is better to chuse indifferent persons than to make an indifferency by putting in those that are *strong* on both sides.

Id.

Metals receive in readily *strongwaters*; and *strongwaters* do readily pierce into metals and stones: and some will touch upon gold that will not touch upon silver.

Id. Natural History.

Many of their propositions savour very *strong* of the old leaven of innovations.

King Charles.

What *strong* cries must they be that shall drown so loud a clamour of impieties!

Decay of Piety.

The scriptures make deep and *strong* impressions on the minds of men: and whosoever denies this, as he is in point of religion atheistical, so in understanding brutish.

Corbet.

The prince of Cambay's daily food
Is asps, and basilisk, and toad;
Which makes him have so *strong* a breath,
Each night he stinks a queen to death.

Hudibras.

A river of so *strong* a current that it suffereth not the sea to flow up its channel.

Heylyn.

I was *stronger* in prophecy than in criticism.

Dryden.

Add with Cecropian thyme *strong*-scented centaury.

Id.

The Marsian and Sabellian race,

Strong-limbed and stout.

Id.

It is no matter how things are; so a man observe but the agreement of his own imaginations, and talk conformably, it is all truth: such castles in the air will be as *strong* holds of truth as the demonstrations of Euclid.

Locke.

Like her sweet voice is thy harmonious song,
As high, as sweet, as easy, and as *strong*.

Smith.

The weak, by thinking themselves *strong*, are induced to proclaim war against that which ruins them; and the *strong*, by conceiting themselves weak, are thereby rendered as useless as if they really were so.

South's Sermons.

Those that are *strong* at sea may easily bring them to what terms they please.

Addison.

The dazzling light

Had flashed too *strongly* on his aking sight.

Id.

The knight is a much *stronger* tory in the country than in town, which is necessary for the keeping up his interest.

Id.

But her own king she likens to his Thames,
Serene yet *strong*, majestic yet sedate,
Swift without violence, without terror great.

Prior.

By mixing such powders, we are not to expect a *strong* and full white, such as is that of paper; but some dusky obscure one, such as might arise from a mixture of light and darkness, or from white and black, that is, a grey, or dun, or russet brown.

Newton's Opticks.

The heat of a human body, as it grows more intense, makes the urine smell more *strong*.

Arbuthnot.

John, who was pretty *strongfisted*, gave him such a squeeze as made his eyes water.

Id.

Water impregnated with salt attenuates *strongly*.

Id.

The *strongest* and most important texts are these which have been controverted; and for that very reason, because they are the *strongest*.

Waterland.

In Britain's lovely isle a shining throng
War in his cause, a thousand beauties *strong*.

Tickell.

Full on his ankle fell the ponderous stone,
Burst the *strong* nerves, and crashed the solid bone.

Pope.

Get *strong* beer to rub your horse's heels. *Swift.*
The ruinous consequences of Wood's patent have been *strongly* represented by both houses.

Id.

When the attention is *strongly* fixed to any subject, all that is said concerning it makes a deeper impression.

Watts.

STRONG (Joseph), an extraordinary genius, born in Carlisle. Though blind from his birth, he displayed an amazing degree of skill in mechanics. He not only made all his own wearing apparel, but constructed an organ, and played well upon it. He went to London for the express purpose of visiting Mr. Stanley, the blind organist. He also made a great number of me-

chanical figures and machines; and died at Carlisle in 1798.

STRONGYLE, in ancient geography, one of the Æolides in the Tyrrhene Sea, on the coast of Sicily; called also Naxos; and now called Stromboli. It has a volcano, ten miles in circumference. See **STROMBOLI**.

STRONTIA. Its basis is strontium, a metal first procured by Sir H. Davy in 1808, precisely in the same manner as barium, to which it is very analogous, but has less lustre. It appeared fixed, difficultly fusible, and not volatile. It became converted into strontia by exposure to air, and, when thrown into water, decomposed it with great violence, producing hydrogen gas, and making the water a solution of strontia. By igniting the mineral strontianite (see **HEAVY SPAR**) intensely with charcoal powder, strontia is cheaply procured. Sir H. Davy, from indirect experiments, is disposed to regard it as composed of about 86 strontium + 14 oxygen, in 100 parts; and, supposing it to be composed of a prime proportion of each constituent, the equivalent prime of strontium would be 6.143, and of strontia 7.143. But from the proportions of the constituents in the carbonate, the prime of strontia appears to be 6.4 or 6.5; and hence that of strontium will be 5.5.

A beautiful red fire, now so frequently used at the theatres, is composed of the following ingredients: forty parts dry nitrate of strontian, thirteen parts of finely powdered sulphur, five parts of chlorate of potash (hyperoxymuriate), and four parts of sulphuret of antimony. The chlorate of potash and sulphuret of antimony should be powdered separately in a mortar, and then mixed together on paper; after which they may be added to the other ingredients, previously powdered and mixed. No other kind of mixture than rubbing together on paper is required. Sometimes a little realgar is added to the sulphuret of antimony, and frequently, when the fire burns dim and badly, a very small quantity of very finely powdered charcoal or lamp-black will make it perfect.

STRONTIAN, in geography, a district of Argyllshire, in the parish of Ardnamurchan, long famous for its lead mines; but now famous for the recent discovery of a new species of earth or stone, found in it, and named from it.

STRONTIAN, a village in the above district, erected for the accommodation of the miners.

STRONTIAN, in mineralogy, a new species of earth lately discovered at Strontian. Dr. Kirwan says, the first information he received of it was from Dr. Crawford in 1790. In the *Miners Journal* for February 1791 a good description of its external appearance, with some account of its chemical properties, was published from the observations of Mr. Sulzer. Its external characters are these: its color is whitish or light green; its lustre common; its transparency intermediate between the semitransparent and opaque; its fracture striated, presenting oblong distinct concretions, somewhat uneven and bent; its hardness moderate, being easily scratched, but not scraped. It is very brittle; and its specific gravity from 3.4 to 3.644. For a farther account of its chemical qualities, see **MINERALOGY**, and

Thom. Chem. vol. I. p. 422, &c. It is not affected by the sulphuric acid; but, when diluted, 10,000 parts of it will dissolve one of strontian. Diluted nitric acid dissolves it rapidly. The muriatic acid, whether diluted or oxydated, dissolves it in a similar manner. It has a strong resemblance to barytes, but essentially differs from it. Its specific gravity is less; it parts with its carbonic acid when urged by heat somewhat more readily, and without suffering fusion; when calcined, it imbibes moisture with vastly greater avidity, swelling and cracking with more heat and noise. Strontian dissolves much more abundantly in hot water than barytes; and the form of the crystals of these pure earths is very dissimilar. The compounds of strontian differ from those of barytes. This earth, united to nitric and muriatic acid, forms salts that suffer changes from exposure to air, which do not happen to the nitrate and muriate of barytes. They are likewise much more soluble in water, and have crystals of a peculiar figure. The combinations of strontian with acids are not, like those of barytes, decomposed by prussiate of lime or of potash. Strontian and, its compounds tinge flame, which barytes does not. Lastly, these earths disagree in the order of their attractions. It is also distinguished from limestone; for it is much heavier, and retains its fixed air with more obstinacy in the fire. The incomparably greater solubility of the pure earth in hot than in cold water, and the crystalline form it assumes, sufficiently distinguish it from lime, which the disposition of the nitrate and muriate to crystallize no less tends to do. 100 parts of strontian are composed of 61.21 of earth, 30.20 of carbonic acid, and 8.59 of water.

STRONTITES, the name first given by Dr. Charles Hope to the new earth; now called strontian, from the district where it was first discovered

STROPHADES, in ancient geography, two islands in the Mediterranean, on the west coast of Peloponnesus, formerly called Plotæ; famous in the mythology for being the scene where Phineus was tormented by the Harpies; till he was delivered from them by his brothers-in-law, Calais and Zethus. The largest is five miles in circumference. Æneas's fleet stopped at them. They are now called Strivali.

STRÓPHE, in ancient poetry, was a certain number of verses, including a perfect sense, and making the first part of an ode.

STROPHIUS, in history partly fabulous, the son of Crisus, and king of Phocis. He married Anaxibia, the sister of Agamemnon, by whom he had **PYLADES**, celebrated for his friendship with his cousin **ORESTES**; who, upon the murder of **AGAMEMNON**, was taken home by Strophius, and educated with his own son. See these articles.

STROPHULUS, in medicine, a papulous eruption, peculiar to infants, and exhibiting a variety of forms, described by Dr. Willan under the titles of *intertinctus*, *albidus*, *confertus*, *volaticus*, and *candidus*.

1. *S. intertinctus*, usually called the red gum, and by the French *efflorescence benigne*. The papulæ characterising this affection rise sensibly

above the level of the cuticle, are of a vivid red color, and commonly distinct from each other. Their number and extent varies much in different cases. They appear most constantly on the cheeks, fore-arm, and back of the hand, but are sometimes diffused over the whole body. The papulæ are, in many places, intermixed with stigmata, and often with red patches of a larger size, which do not, however, occasion any elevation of the cuticle. A child's skin thus variegated somewhat resembles a piece of red printed linen; and hence this eruption was formerly called the red gown, a term which is still retained in several counties of England, and may be found in old dictionaries. Medical writers have changed the original word for one of a similar sound, but not more significant. The *strophulus intertinctus* has not, in general, any tendency to become pustular, a few small pustules containing a straw-colored watery fluid occasionally appear on the back of the hand, but scarcely merit attention, as the fluid is always re-absorbed in a short time without breaking the cuticle. The eruption usually terminates in scurf, or exfoliation of the cuticle; its duration, however, is very uncertain, the papulæ and spots sometimes remain for a length of time without an obvious alteration, sometimes disappear and come out again daily; but, for the most part, one eruption of them succeeds another at longer intervals and with more regularity. This complaint occurs chiefly within the two first months of lactation. It is not always accompanied with or preceded by any disorders of the constitution, but appears occasionally in the strongest and most healthy children. Some authors connect it with aphthous ulcerations common in children, supposing the latter to be a part of the same disease diffused along the internal surfaces of the mouth and intestines. The fact however seems to be that the two affections alternate with each other; for those infants who have the papulous eruption on the skin are less liable to aphthæ; and when the aphthæ takes place to a considerable degree the skin is generally pale and free from eruption. The *strophulus intertinctus* is, by most writers, said to originate from an acidity, or acrimonious quality of the milk taken into a child's stomach, communicated afterwards to the blood, and stimulating the cutaneous excretories. This opinion might, without difficulty, be proved to have little foundation. The pre-disposition to the complaint may be deduced from the delicate and tender state of the skin, and from the strong determination of blood to the surface, which evidently takes place in infants. The papulous eruption is, in many cases, connected with a weak, irritable state of the alimentary canal, and consequent indigestion. For, if it be by any means suddenly repelled from the surface, diarrhea, vomiting, spasmodic affections of the bowels, and often general disturbance of the constitution succeed; but as soon as it re-appears those internal complaints are wholly suspended. Dr. Armstrong and others have particularly noted this reciprocity which makes the red gum, at times, a disease of some importance, though in its usual form it is not thought to be in any respect dangerous. On their remarks a necessary caution

is founded, not to expose infants to a stream of very cold air, nor to plunge them unseasonably in a cold bath. The most violent and even fatal symptoms have often been the consequence of such imprudent conduct.

2. *S. albidus*, by some termed the white gum, is merely a variety of *strophulus intertinctus*, but deserves some notice on account of the different appearance of its papulæ. In place of those described as characterising the red gum, there is a number of minute whitish specks, a little elevated, and sometimes, though not constantly, surrounded by a slight redness. These papulæ, when their tops are removed, do not discharge any fluid; it is, however, probable that they are originally deformed by the deposition of a fluid which afterwards concretes under the cuticle. They appear chiefly on the face, neck, and breast, and are more permanent than the papulæ of the red gum. In other respects they have the same nature and tendency, and require a similar plan of treatment. Although a distinctive name has been applied to this eruption, when occurring alone, yet it is proper to observe that in a great number of cases there are red papulæ and spots intermixed with it, which prove its connexion with the *strophulus intertinctus*.

3. *S. confertus*. An eruption of numerous papulæ, varying in their size, appears on different parts of the body in infants during dentition, and has thence been denominated the tooth rash: it is sometimes also termed the rank red gum. About the fourth or fifth month after birth an eruption of this kind usually takes place on the cheeks and sides of the nose, extending sometimes to the forehead and arms, but rarely to the trunk or body. The papulæ on the face are smaller and set more closely together than in the red gum; their color is not so vivid, but they are generally more permanent. They terminate at length with slight exfoliations of the cuticle, and often appear again in the same places a short time afterwards. The papulæ which in this complaint occasionally appear on the back or loins, are much larger, and somewhat more distant from each other, than those on the face. They are often surrounded by an extensive circle of inflammation, and a few of them contain a semi-pellucid watery fluid, which is re-absorbed when the inflammation subsides. In the seventh or eighth the *strophulus confertus* assumes a somewhat different form: one or two large irregular patches appear on the arms, shoulder, or neck; in which the papulæ are hard, of a considerable size, and set so close together that the whole surface is of a high red color. Most commonly the fore-arm is the seat of this eruption, the papulæ rising first on the back of the hand and gradually extending upwards along the arm. Sometimes, however, the eruption commences at the elbow, and proceeds a little upwards and downwards on the outside of the arm. It arrives at its height in about a fortnight; the papulæ then begin to fade and become flat at the top, afterwards the cuticle exfoliates from the part affected, which remains discolored, rough, and irregular, for a week or two longer.

An obstinate and very painful modification of this disease takes place, though not often, on the

lower extremities. The papulæ spread from the calves of the legs to the thighs, nates, loins, and round the body as high as the navel: being very numerous and close together they produce a continuous redness over all the parts above-mentioned. The cuticle presently, however, shrivels, cracks in various places, and finally separates from the skin in large pieces. During this process a new cuticle is formed, notwithstanding which the complaint recurs in a short time and goes through the same course as before. In this manner successive eruptions take place during the course of three or four months, and perhaps do not cease till the child is one year old, or somewhat more. Children necessarily suffer great uneasiness from the heat and irritation occasioned by so extensive an eruption, yet, while they are affected with it, they often remain free from any internal or febrile complaint. This appearance should be distinguished from the intertrigo of infants, which exhibits a uniform, red, smooth, shining surface, without papulæ, and which affects only the lower part of the nates and inside of the thighs, being produced by the stimulus of the urine, &c., with which the child's clothes are almost constantly wetted. The *strophulus confertus*, where the child is otherwise healthy, is generally ascribed to a state of indigestion, or some febrish complaint of the mother or nurse. Dr. Willan, however, asserts that he has more frequently seen the eruption when no such cause was evident. It may with more probability be considered as one of the numerous symptoms of irritation arising from the inflamed and painful state of the gums in dentition; since it always occurs during that process, and disappears soon after the first teeth have cut the gums.

4. *S. volaticus* is characterised by an appearance of small circular patches, or clusters of papulæ, arising successively on different parts of the body. The number of papulæ in each cluster is from six to twelve. Both the papulæ and their interstices are of a high red color. These patches continue red with a little heat or itching for about four days, when they turn brown and begin to exfoliate. As one patch declines another appears at a small distance from it, and in this manner the complaint often spreads gradually over the face, body, and limbs, not terminating in less than three or four weeks. During that time the child has sometimes a quick pulse, a white tongue, and seems uneasy and fretful. In many cases, however, the eruption takes place without any symptoms of internal disorder. The above complaint has been by some writers denominated *ignis volaticus infantum*: under this title Astruc and Lorry have described one of the forms of *crusta lactea*, in which a successive eruption of pustules takes place on the same spot, generally about the mouth or eyes, in children of different ages, and sometimes in adults. The maculæ volaticæ infantum mentioned by Wittichius, Sennertus, and Sebizeus, agree in some respect with the *strophulus volaticus*; but they are described by other German authors as a species of *erysipelas*, or as irregular efflorescences affecting the genitals of infants, and often proving fatal. The *strophulus volaticus* is a complaint by

no means frequent. In most cases which have come under Dr. Willan's observation it appeared between the third and sixth month; in one instance, however, it occurred about ten days after birth, and continued three weeks, being gradually diffused from the cheeks and forehead to the scalp, afterwards to the trunk of the body and to the extremities; when the patches exfoliated, a red surface was left with slight border of detached cuticle.

5. *S. candidus*. In this form of strophulus the papulæ are larger than in any of the foregoing species. They have no inflammation round their base; their surface is very smooth and shining, whence they appear to be of a lighter color than the adjoining cuticle. They are diffused, at a considerable distance from each other, over the loins, shoulders, and upper part of the arms; in any other situation they are seldom found. This eruption affects infants about a year old, and most commonly succeeds some of the acute diseases to which they are liable. Dr. Willan has observed it on their recovery from a catarrhal fever, and after inflammations of the bowels or lungs. The papulæ continue hard and elevated for about a week, then gradually subside and disappear.

STROUD, a town and parish in Shamwell hundred, Kent, is separated from Rochester by the river Medway, over which it has a stone bridge of eleven arches. It is twenty-eight miles and a half east from London. The church is a handsome building, consisting of a nave and two aisles, 100 feet in length. In the south aisle is a stone chapel, the pavement of which contains several specimens of Mosaic; and the remains of an ancient mansion of the Knights'-Templars is still discernible in a farm-house now called the Temple-house, on the banks of the river. Fair, 28th of August.

STROUD, a market-town, in Bisley hundred, Gloucester, situate on an eminence near the Stroud-water, which empties itself into the Severn, ten miles south-east of Gloucester, and 102 west by north from London. Its water is celebrated for the dyeing of scarlet and other grain colors, on which account the clothing trade has been extended for upwards of twenty miles along the river, and on its banks are several fulling-mills. The Severn canal passes this town to Cirencester, and joins the Thames at Lechlade. The church is a good building, having a high spire at the west end and a tower in the middle. Here are also meeting-houses for the dissenters, an endowed free-school, and several charity-schools. Market on Friday. Fairs, May 12th and August 21st. It returns two members

STROUT, *v. a.* For Strut. To swell out; to puff out; to enlarge by affectation.

I will make a brief list of the particulars in an historical truth nowise *strouted*, nor made greater by language. *Bacon.*

STROY, *v. a.* For destroy.

Dig garden, *stroy* mallow, now may you at ease.

Tusser.

STROZZI (Cyriacus), a Peripatetic philosopher, born at Florence, in 1504. He became professor of philosophy, and of Greek at Florence, Bologna, and Pisa; and in all these

places was much esteemed. He added two books in Greek and Latin to Aristotle's Treatise De Republica; and died in 1565.

STROZZI (Titus and Hercules), father and son, two Italian poets, natives of Ferrara. They both wrote in Latin, and their poems were printed together in 8vo. at Venice, in 1513. They consist of elegies, odes, &c., in a pleasing style. Titus was born in 1422, and died in 1502, aged eighty. Hercules, his son, was killed by a rival in 1508.

STRUCK. The old preterite and participle passive of strike.

Down fell the duke, his joints dissolved asunder,
Blind with the light, and *strucken* dead with wonder.
Fairfax.

All liquors *strucken* make round circles, and dash.
Bacon.

Silent, and in face

Confounded, long they sat as *strucken* mute. *Milton.*

This message bear: the Trojans and their chief
Bring holy peace, and beg the king's relief;
Struck with so great a name, and all on fire,
The youth replies, whatever you require. *Dryden.*

In a regular plantation, I can place myself in its several centers, so as to view all the walks *struck* from them. *Spectator.*

Some to conceit alone their taste confine,
And glittering thoughts *struck* out at every line.

Pope.

STRUCTURE, *n. s.* Fr. *structure*; Lat. *structura*, *structus*. Act or practice of building; the manner of building; building made.

Ecbatana her *structure* vast there shews,
And Hecatophyllos her hundred gates. *Milton.*

His son builds on, and never is content,
Till the last farthing is in *structure* spent. *Dryden.*

Several have gone about to inform them; but, for want of insight into the *structure* and constitution of the terraqueous globe, have not given satisfaction. *Woodward.*

High on a rock of ice the *structure* lay. *Pope.*

There stands a *structure* of majestick frame. *Id.*

STRUDEL (Peter), an eminent historical painter, born in the Tyrolese, in 1680. He settled at Vienna, where he adorned the palaces and churches with many fine paintings. He died in 1717.

STRUENSEE (John Frederick) was the son of a clergyman of Halle, in Saxony, and born in 1737. At an early age he manifested promising talents, and devoted himself to the study of medicine; having taken his degree of doctor in 1757 he removed to Altona, and there obtained extensive practice. Besides the acquaintance he formed with two persons, viz. count Von Ranzau Aschberg and count Brandt, connected with his subsequent fate, he acquired also, in the course of his practice, the friendship of the widow of the chief marshal of the court to Frederic V.; and thus was honored with an appointment, in 1768, to be one of the physicians of the king, whom he accompanied in his tour to Germany, France, and England. Soon after the marriage of Christian VII. with Matilda, the English princess, an open rupture succeeded a coolness that was observed to subsist between this prince and the queen. The queen-dowager availed herself of this circumstance with a view of recovering her influ

ence. On the birth of the crown-prince the misunderstanding between the queens increased; nor did the king's tour contribute to lessen his indifference towards his consort. On his return the discontent was manifested openly, and divided the nation into two parties. The most numerous party was supported by the minister and the principal officers of state; and at the head of it was count Holk, the king's favorite. The queen-dowager had her partisans at Friedensburg; and some young persons, who had neither influence nor property, took part with Matilda, and entertained hopes that, on account of her youth, beauty, and engaging manners, a reconciliation might be effected between her and the king. The young queen, however, well knowing that these friends had no experience in court intrigues, formed her own plan, and determined to make every possible effort for depriving count Holk of the royal favor, and thus of regaining the confidence of the king. Holk, for his own security, endeavoured to widen the breach between the royal pair; and, conceiving that Struensee hated the queen as much as he himself did, he persuaded his royal master to take Struensee with him whenever he visited the queen. But, contrary to Holk's expectations, the king became attached to Struensee; and the queen remarking this change became gradually familiarised to his company. The crown-prince being at this time successfully inoculated for the small-pox by Struensee, the queen informed him that, in recompense of his services, he should be entrusted with the prince's education.

Struensee was now made a counsellor of conference, with a salary of 1500 dollars, and appointed reader to the king and queen. This new favorite succeeded in his endeavours for producing a complete reconciliation between the king and his royal consort; which was followed by an indifference, on the part of the former, towards Holk. Bernstorff, the minister, became jealous of Struensee, and attempted, though unsuccessfully, to undermine the confidence reposed in him by the king and queen. Soon after, the court made a tour to Schleswic; and the heads of the different parties composed the royal suite. The queen behaved to both parties in the same courteous manner. Brandt succeeded Holk in the king's favor and confidence; but Bernstorff, though mortified by the loss of his influence over the king, declined making a voluntary resignation. His fate, however, was soon determined, and intimation was given him that his services were no longer necessary. The remaining members of government were dismissed, and the administration was formed by the friends of the queen and of Struensee. During these events, the queen-dowager remained at Friedensburg, watching their progress, and condoling with the discarded ministers. The queen at length obtained a complete triumph. The king behaved to her with the affectionate tenderness which her amiable qualities deserved; and Struensee possessed her confidence, and employed all possible means to retain it. The king, naturally of a weak mind, was secluded from society by Struensee; and Brandt was commissioned to keep him constantly occupied with amusements. The

king was gratified by this mode of life; the influence of Struensee was augmented; and he at length accomplished his main object, which was that of preventing his majesty from personally transacting any business with his ministers. In process of time, or towards the close of the year 1770, a circumstance occurred which served to place unlimited power in the hands of the young queen and her ministers. Struensee neglected no means to increase his power; and, in order to retain it the more securely, he prevailed on the queen to commit to his management the whole business of the cabinet.

In consequence of this measure, the whole form of the government was new-modelled; and public business was transacted in the king's name, by those immediately around him. But Struensee's paramount power was of no long duration. His boldness, approaching to the highest degree of insolence, degenerated into timidity when any of his measures were opposed; and, though he conducted foreign affairs according to the principles of sound policy, his internal administration, perverted by avarice or ambition, did not answer the purpose intended. The various measures which he projected for the improvement of the government and country, and which our limits will not allow us to detail, excited disgust and dissatisfaction amongst persons of every rank and condition, from the highest to the lowest. Struensee, however, was indefatigable in the complicated duties of his office, and sedulously attentive to the education of the crown-prince. Two of his brothers were advanced to stations of importance; one in the new college of finance, and the other in the department of war. Brandt, Berger, the physician, and other confidential persons, remained constantly near the king's person, nor were any others, suspected to be adverse to the existing order of things, permitted to have any intercourse with him; so that his indifference to public business gradually increased, and his capacity for conducting it diminished. In July 1771 the queen was delivered of a princess; and as she knew the surmises, originating at Friedensburg, that were circulated on this occasion, she was not unapprehensive that they might serve as pretences to wrest from her the power which she had acquired. She was unfortunately dependent on Struensee, who, by the abuse of his power, had become an object of detestation. Not content with being enrolled in the list of the Spanish nobility, and being created count, he invented a new title, or that of private counsellor of the cabinet, and with this he acquired a degree of power which had never been enjoyed before by any minister of Denmark. In fact, it was this ambitious minister's aim to annihilate the royal authority; and in the circumstances then existing, and under the protection of the queen, if he had conducted himself with more prudence, he would have defeated the machinations of those who were meditating his ruin.

But a spirit of discontent now pervaded all ranks; the sailors and the soldiers complained of his conduct; and the populace joined the malcontents in their opposition and murmur. The dissatisfaction and tumult that prevailed in-

creased Struensee's timidity: his measures were indecisive, and his situation became every day more dangerous. The British minister, actuated by a respect for the young queen, endeavoured to hasten his removal from power, and he himself wished for a release. Accordingly he offered him a sum of money to enable him to quit the country. The queen, apprehending that her enemies would get the king into their hands, and obtain possession of all the royal power, opposed this measure. A crisis, however, was approaching; and Struensee could no longer resist or control the counsels and operations of those who were hastening his downfall. Notwithstanding the measures which he adopted for insuring his own personal safety, and which were interpreted by the people into a kind of avowal of his political misconduct, every thing conspired, not only to accelerate his own ruin, but to favor the plan which had been formed against the young queen. On the morning of the 17th of January, 1772, the inhabitants of Copenhagen heard, not without astonishment and terror, that this princess, count Struensee, his brother, count Brandt, and all their friends and adherents, had been arrested in the night. At three o'clock in the morning, succeeding a ball that had been given at court the preceding evening, and after the queen had closed about one o'clock with prince Frederick, colonel Koller, an inveterate enemy of Struensee's, whose regiment was on guard at the palace, informed his officers, after having admitted them into the palace, that he had the king's orders to take the queen into custody. The officers, without requiring to see the orders, which would have defeated the whole plan, implicitly obeyed. Ranzau hurried into the king's bed-chamber, and, drawing the curtains so as to awaken him, told him, before he had time for reflection, that his life was in danger. 'What must we do?' said the alarmed king: 'shall we fly? stand by me: give me your advice.'—'Sign this,' replied Ranzau, 'it will save my sovereign and the whole royal family.' The king took hold of his pen, but let it drop as soon as he cast his eye on the name of his consort. At length he suffered himself to be persuaded; and Ranzau, supported by colonel Eichstadt, whose dragoons surrounded the palace, and some other officers, carried out the fatal order; and, in a manner the most violent and brutal, seized the person of the unfortunate Matilda, and conveyed her in a carriage to the castle of Cronenburg. Struensee's arrest was followed by the appointment of a commission for his trial; and the proceedings against him were carried on with great zeal and severity. The indictment, drawn up by the fiscal general in very intemperate language, and delivered to the court on the 21st of April, 1772, after relating the circumstances of his life and character, stated nine articles as capital charges. 'For many years before his fall,' says his biographer, who has compiled his article from a variety of original documents, and of which we have freely availed ourselves, 'Struensee had lived an avowed free-thinker. He was convinced, however, of the existence of a Supreme Being, by whom the world was created; but he considered mankind as mere machines, governed by no

moral principle; looked upon a future state as an idle dream; and believed that after death a man had nothing to hope or to fear. During the first week of his imprisonment he endeavoured by these principles to compose his agitated mind; and, giving way also to the warmth of his imagination, fancied that a thousand circumstances might occur to liberate him from his dangerous situation. He was thus able, for a little time, to bear up under his misfortunes, and to assume an apparent cheerfulness; but these were merely palliatives, which losing their effect, he soon fell into a state of the most violent anguish and dismay.

A visit, however, which he received from the celebrated Dr. Munter, a clergyman of Copenhagen, who went to see him in prison on the 1st of March, 1772, laid the foundation for a change in his sentiments, which enabled him afterwards to support his sufferings with more fortitude and resignation. This worthy man discussed with him proofs of Christianity; listened to his doubts and objections, and answered them in the mildest yet most forcible manner; and at length gained so much on his heart that he gave himself up entirely to his direction. When his trial came on, his advocate, in a short written defence, endeavoured to disprove all the charges that had been brought against him, with the exception of one, which was the disrespect personally shown to the king. Of this he acknowledged himself guilty, was heartily sorry for it, and threw himself on the mercy of his offended sovereign. The court, however, which had resolved that Struensee should suffer an ignominious death, rejected all representations made in his favor, and on the 25th of April passed the following sentence:—'That after his right hand had been cut off he should be beheaded; that his body should then be quartered, and in that state publicly exposed; and that his head and hand should be affixed to a pole.' On the next day, April the 26th, Dr. Munter paid him a visit, and informed him that this sentence had in every point been confirmed by the king, and that the 28th was the day appointed for its being carried into execution. The unfortunate count heard this intelligence with the utmost composure; and declared that, in regard to the ignominious circumstances attending his doom, he was perfectly easy, as he believed in a future resurrection. He spent the intervening time in a manner becoming his situation, and suffered according to his sentence along with his friend Brandt, who had also been condemned, amidst an immense concourse of spectators.

STRUGGLE, *v. n.* & *n. s.* Of uncertain etymology. To labor; act with effort; strive; contend: the effort, contention, or contest made.

In the time of Henry VIII. differences of religion tore the nation into two mighty factions; and, under the name of Papist and Protestant, *struggled* in her bowels with many various events. *Temple.*

Strong virtue, like strong nature, *struggles* still, Exerts itself, and then throws off the ill. *Dryden.*

I repeat, like some despairing wretch That boldly plunges in the frightful deep, Then pants and *struggles* with the whirling waves, And catches every slender reed to save him. *Smith.*

No man is guilty of an act of intemperance but he might have forborne it ; yet without some trouble from the *strugglings* of the contrary habit, but still the thing was possible. *South.*

If men *struggle* through as many troubles to be miserable as to be happy, my readers may be persuaded to be good. *Spectator.*

When, in the division of parties, men only strove for the first place in the prince's favour, an honest man might look upon the *struggle* with indifference. *Addison.*

It began and ended without any of those unnatural *struggles* for the chair, which have disturbed the peace of this great city. *Atterbury.*

STRU'MA, *n. s.* Lat. *struma*. A glandular swelling ; the king's evil.

A glandulous consumption, such as does not affect the lungs with a rupture of its vessels, and coughing up blood, is produced by *strumous* or scrophulous humours. *Blackmore.*

A gentlewoman had a *struma* about the instep, very hard and deep about the tendons. *Wiseman's Surgery.*

How to treat them when *strumous*, scirrhus, or cancerous. *Wiseman.*

STRUMFIA, in botany, a genus of plants belonging to the class of syngenesia, and to the order of monogamia : CAL. quinque-dentate and superior : COR. pentapetalous : and the berry monospermous. There is only one species ; viz. *S. maritima*.

STRUMPET, *n. s. & v. a.* Of doubtful original. *Stropo* vieux mot palliardise : Lat. *stuprum*. A whore ; prostitute : to debauch.

If we two be one, and thou play false,
I do digest the poison of thy flesh,
Being *strumpeted* by the contagion. *Shakspeare.*

How like a younker or a prodigal
The skarfed bark puts from her native bay,
Hugged and embraced by the *strumpet* wind !
How like a prodigal doth she return,
Lean, rent, and beggared by the *strumpet* wind !
Id.

If to preserve this vessel for my lord
From any other foul unlawful touch,
Be not to be a *strumpet*, I am none. *Id. Othello.*
Common fame is as false and impudent as a common *strumpet*. *L'Estrange.*

Honour had his due ;
Before the holy priest my vows were tied ;
So came I not a *strumpet* but a bride. *Dryden.*

STRUT, *v. n. & n. s.* Teut. *strotzen*, of Goth. *trotna*. To walk with affected dignity ; swell ; play the fop or dandy : the noun substantive corresponding.

Adore our errors, laugh at's while we *strut*
To our confusion. *Shakspeare. Antony and Cleopatra.*
Does he not hold up his head, and *strut* in his gait ? *Shakspeare.*

Though thou *strut* and paint,
Yet art thou both shrunk up and old. *Ben Jonson.*
The false syren
Struts on the waves, and shows the brute below. *Dryden.*

We will be with you ere the crowing cock
Salutes the light, and *struts* before his feathered flock. *Id.*

The goats with *strutting* dugs shall homeward speed. *Id.*

The power appeased, with winds sufficed the sail,
The belling canvass *strutted* with the gale. *Id.*

As thy *strutting* bags with money rise,
The love of gain is of an equal size. *Id.*

STRUTT (Joseph), artist and antiquary, was born in 1749, at Springfield in Essex, where his father was a miller. In 1764 he was articulated to W. Wynn Ryland engraver, and in 1770 obtained the gold and silver medals of the Royal Academy. Uniting the study of antiquities with his art, he published in 1773 his first work, entitled *The Regal and Ecclesiastical Antiquities of England*, 4to., which contained representations of all the English monarchs from Edward the Confessor to Henry VIII. This was followed by *Horda Angel Cynnan*, or a complete view of the manners, customs, alms, habits, &c., of the English, from the arrival of the Saxons to the times of Henry VIII., &c., 1774, 1775, and 1776, 3 vols. with 157 plates. In 1777 and 1778 he published *A Chronicle of England*, which he meant to extend to six volumes, but dropped the design for want of encouragement. His *Biographical Dictionary of Engravers* appeared in 1785 and 1786, in 2 vols. In 1790 he was obliged by his health to quit the metropolis and retire into Hertfordshire, where he occupied himself in a series of plates for the *Pilgrim's Progress*. In 1795 he returned to London, and began to collect materials for his *Complete View of the Dresses and Habits of the People of England*, &c., the first volume of which appeared in 1796, and the second in 1799, 4to. In 1801 he published his last and most distinguished work, entitled the *Sports and Pastimes of the People of England*, with forty plates, of which a new octavo edition, with 140 plates, edited by Hone, has been lately projected. He died in London in October 1802, aged fifty-three. He left some MSS. in the possession of his son, from which have since been published his *Queen Hoo Hall*, a Romance, and *Ancient Times*, a Drama, 4 vols. 12mo. ; also *The Test of Guilt*, or *Traits of Ancient Superstition*, a dramatic tale.

STRUTHIO, in natural history, a genus of birds belonging to the order of grallæ of Linnæ ; but, according to the new classification of Dr. Latham, it forms, along with the dodo, casuarium, and rhea, a separate order, under the name of struthionæ.

I. S. camelus, the ostrich, has a bill somewhat conical ; the wings are so short as to be unfit for flying ; the thighs and sides of the body are naked ; the feet are formed for running, having two toes, one only of which is furnished with a nail. In this respect it differs entirely from the cassowary, which has three toes complete. The ostrich is without doubt the largest of all birds ; it is nearly eight feet in length, and, when standing upright, from six to eight feet in height. We are told in the *Gentleman's Magazine* that two ostriches were shown in London in 1750, and that the male was ten feet in height, and weighed 3½ cwt. The head and bill somewhat resemble those of a duck ; and the neck may be likened to that of a swan, but that it is much longer ; the legs and thighs resemble those of a hen, though the whole appearance bears a strong resemblance to that of a camel. But, though usually seven

feet high from the top of the head to the ground, from the back it is only four; so that the head and neck are above three feet long. From the top of the head to the rump, when the neck is stretched out in a right line, it is six feet long, and the tail is about a foot more. One of the wings, without the feathers, is a foot and a half; and being stretched out, with the feathers, is three feet. The plumage is much alike in all; that is, generally black and white, though some of them are said to be gray. There are no feathers on the sides, nor yet on the thighs, nor under the wings. The lower part of the neck, about half way, is covered with still smaller feathers than those on the belly and back; and those also are of different colors. All these feathers are of the same kind, and peculiar to the ostrich; for other birds have several sorts, some of which are soft and downy, and others hard and strong. Ostrich feathers are all almost as soft as down, being utterly unfit to serve the animal for flying, and still less adapted to be a proper defence against external injury. The feathers of other birds have the webs broader on one side than the other, but those of the ostrich have their shaft exactly in the middle. The upper part of the head and neck are covered with a very fine clear white hair, that shines like the bristles of a hog; and in some places there are small tufts of it, consisting of about twelve hairs, which grow from a single shaft about the thickness of a pin. At the end of each wing there is a kind of spur, almost like the quill of a porcupine. It is an inch long, hollow, and of a horny substance. There are two of these on each wing, the largest of which is at the extremity of the bone of the wing, and the other a foot lower. The neck is slender in proportion to that of other birds, from its not being furnished with feathers. The skin in this part is of a livid flesh color. The bill is short and pointed, and two inches and a half at the beginning. The external form of the eye is like that of a man, the upper eye-lid being adorned with eye-lashes, which are longer than those on the lid below. The tongue is small, very short, and composed of cartilages, ligaments, and membranes, intermixed with fleshy fibres. In some it is about an inch long, and very thick at the bottom; in others only half an inch, and a little forked at the end. The thighs are very fleshy and large, being covered with a white skin inclining to redness, and wrinkled like a net, whose meshes admit the end of the finger. Some have small feathers on the thighs; others have neither feathers nor wrinkles. The legs are covered before with large scales; the end of the foot is cloven, and has two very large toes, which are also covered with scales. These toes are of unequal sizes. The largest, which is on the inside, is seven inches long, including the claw, which is nearly three-fourths of an inch in length, and almost as broad. The other toe is but four inches long, and is without a claw. The internal parts of this animal are no less peculiar. At the top of the breast, under the skin, the fat is two inches thick; and on the fore part of the belly it is as hard as suet, and about two inches and a half thick in some places. It has two dis-

tingt stomachs. The lowermost, in its natural situation, somewhat resembles the crop in other birds; but it is considerably larger than the other stomach, and is furnished with strong muscular fibres, circular and longitudinal. The upper stomach has outwardly the shape of the stomach of a man; and upon opening is always found filled with a variety of discordant substances, hay, grass, barley, beans, bones, and stones, some of which exceed in size a pullet's egg. The kidneys are eight inches long and two broad, and differ from those of other birds in not being divided into lobes. The heart and lungs are separated by a diaphragm as in quadrupeds, and the parts of generation also bear a very strong resemblance. The ostrich is a native only of the torrid regions of Africa, and has long been celebrated by those who have had occasion to mention the animals of that region. Its flesh is prohibited in Scripture to be eaten; and most of the ancient writers describe it as well known. Its race is transmitted down without mixture, and it has never been known to breed out of that country which first produced it. It seems formed to live among the sandy and burning deserts of the torrid zone; and, as in some measure it owes its birth to their genial influence, so it seldom migrates into other tracts. The Arabians assert that the ostrich never drinks, and the place of its habitation confirms the assertion. In these dreary regions ostriches are seen in large flocks, like a regiment of cavalry, and have often alarmed a whole caravan. There is no desert, how barren soever, but what is capable of supplying these animals with provisions; they eat almost every thing; and these barren tracts are thus doubly grateful, as they afford both food and security. The ostrich is of all animals the most voracious. It will devour leather, glass, hair, iron, stones, or any thing. Those substances which the coats of the stomach cannot soften, pass whole: so that glass, stones, or iron, are excluded in the form in which they were devoured. In an ostrich dissected by Rauby there appeared such a quantity of heterogeneous substances, that it was wonderful how an animal could digest such an overcharge of nourishment. Valisnieri also found the first stomach filled with a quantity of incongruous substances; grass, nuts, cords, stones, glass, brass, copper, iron, tin, lead, and wood; a piece of stone was found among the rest that weighed more than a pound. He saw one of these animals that was killed by devouring a quantity of quicklime. In their native deserts, however, it is probable they live chiefly upon vegetables, where they lead an inoffensive and social life; the male, as Thevenot assures us, assorting with the female with connubial fidelity. They are said to be very much inclined to venery. They copulate like other birds by compression. They lay very large eggs, some of them being above five inches in diameter, and weighing above fifteen pounds. These eggs have a very hard shell somewhat resembling those of the crocodile, only those of the latter are less and rounder. The season for laying depends on the climate. In the north part of Africa, this season is early in July; in the south about the end of December.

These birds are very prolific, and lay generally from forty to fifty eggs at one clutch, which are as big as a child's head. It has been affirmed that the female deposits them in the sand, leaves them to be hatched by the heat of the climate, and the young to shift for themselves. But no bird has a stronger affection for her young than the ostrich, nor none watches her eggs with greater assiduity. In those hot climates, indeed, there is less necessity for the continual incubation of the female; and she often leaves her eggs, which are in no danger of being chilled by the weather; but, though she leaves them by day, she always carefully broods over them by night; and Kolben, who has seen great numbers of them at the Cape of Good Hope, affirms that they sit on their eggs like other birds, and that the male and female take this office by turns. Nor is it true that they forsake their young after they are excluded the shell. On the contrary, the young ones are not even able to walk for several days after they are hatched. During this time the old ones are very assiduous in supplying them with grass, and encounter every danger in their defence. The young, when brought forth, are of an ash color the first year, and are covered with feathers all over. But in time these feathers drop; and those parts which are covered assume a different and more becoming plumage. The beauty of a part of this plumage, particularly the long feathers that compose the wings and tail, is the chief reason that man has been so active in pursuing this harmless bird to its deserts, and hunting it with no small degree of expense and labor. The ancients used those plumes in their helmets; our military wear them in their hats; and the ladies make them an ornament in their dress. Those feathers which are plucked from the animal while alive are much more valued than those taken when dead, the latter being dry, light, and subject to be worm-eaten. Besides the value of their plumage, some of the savage nations of Africa hunt them also for their flesh, which they consider as a dainty. They sometimes also breed these birds tame, to eat the young ones. Some nations have obtained the name of *Struthiophagi*, or ostrich eaters, from their peculiar fondness for this food; and the Romans themselves were not averse to it. The eggs of the ostrich are said to be well tasted, and extremely nourishing; but they are too scarce to be fed upon, although a single egg be a sufficient entertainment for eight men. As the spoils of the ostrich are thus valuable, man has become their most assiduous pursuer. The Arabians train up their fleetest horses to hunt the ostrich. Of all the varieties of the chase, this is said to be the most entertaining. As soon as the hunter comes within sight of his prey, he puts on his horse with a gentle gallop, so as to keep the ostrich still in sight, yet not so as to terrify him. Of all known animals, the ostrich is by far the swiftest in running: upon observing himself, therefore, pursued at a distance, he begins to run at first but gently. In this situation he resembles a man at full speed; his wings, like arms, keep working with a motion corresponding to that of his legs; and his speed would very soon snatch him from the view of his pursuers; but, instead of

going off in a direct line, he takes his course in circles; while the hunters still make a small course within, relieve each other, meet him at unexpected turns, and keep him thus still followed, for two or three days together. At last, spent with fatigue and famine, and finding all power of escape impossible, he endeavours to hide himself from those enemies he cannot avoid, and covers his head in the sand or the first thicket he meets. Sometimes, however, he attempts to face his pursuers; and, though the most gentle animal in nature, when driven to desperation he defends himself with his beak, wings, and feet. Such is the force of his motion, that a man would be unable to withstand him in the shock. The *Struthiophagi* have another method of taking this bird; they cover themselves with an ostrich's skin, and, passing up an arm through the neck, thus counterfeit all the motions of this animal. By this artifice they approach the ostrich, which becomes an easy prey. He is sometimes also taken by dogs and nets; but the most usual way is that mentioned above. When the Arabians have thus taken an ostrich, they cut its throat; and, making a ligament below the opening, they shake the bird as one would rinse a barrel; then, taking off the ligature, there runs out from the wound in the throat a considerable quantity of blood mixed with the fat of the animal; and this is considered as one of the greatest dainties. They next flay the bird; and of the skin, which is strong and thick, sometimes make a kind of vest, which answers the purpose of a cuirass and a buckler. Others do not kill their captive, but endeavour to tame it, for the purposes of supplying those feathers which are in so great request. The inhabitants of Dara and Lybia breed up whole flocks of them, and they are tamed with very little trouble. In this domestic state, they are often ridden upon and used as horses. Moore assures us that at Jour he saw a man travelling upon an ostrich; and Adanson asserts that at the factory of Podore he had two ostriches, which were then young, the strongest of which ran swifter than the best English racer, although he carried two negroes on his back. As soon as the animal perceived itself thus loaded, it set off running with all its force, and made several circuits round the village, till at length the people were obliged to stop it by barring up the way.

II. 1. *S. casuarius*, the cassowary (the galeated cassowary of Dr. Latham) was first brought into Europe from Java by the Dutch about 1597. It is nearly equal in size to the ostrich, but its legs are much thicker and stronger in proportion. This conformation gives it an air of strength and force, which the fierceness and singularity of its countenance conspire to render formidable. It is five feet and a half long from the point of the bill to the extremity of the claws. The legs are two feet and a half high from the belly to the end of the claws. The head and neck together are one foot and a half; and the largest toe, including the claw, is five inches long. The claw alone of the least toe is three inches and a half in length. The wing is so small that it does not appear, it being hid under the feathers of the back. In

other birds a part of the feathers serve for flight, and are different from those that serve merely for covering; but in the cassowary all the feathers are of the same kind, and outwardly of the same color. They are generally double, having two long shafts, which grow out of a short one, which is fixed in the skin. Those that are double are always of an unequal length; for some are fourteen inches long, particularly on the rump, while others are not above three. The beards that adorn the stem or shaft are about half way to the end, very long, and as thick as a horse-hair, without being subdivided into fibres. The stem or shaft is flat, shining, black, and knotted below; and from each knot there proceeds a beard; likewise the beards at the end of the large feathers are perfectly black, and towards the root of a gray tawny color; shorter, more soft, and throwing out fine fibres like down; so that nothing appears except the ends, which are hard and black; because the other part, composed of down, is quite covered. There are feathers on the head and neck; but they are so short and thinly sown that the bird's skin appears naked, except towards the hinder part of the head, where they are a little longer. The feathers which adorn the rump are extremely thick; but do not differ in other respects from the rest, excepting their being longer. The wings, when they are deprived of their feathers, are but three inches long; and the feathers are like those on other parts of the body. The ends of the wings are adorned with five prickles of different lengths and thickness, which bend like a bow; these are hollow from the roots to the very points, having only that slight substance within which all quills are known to have. The longest of these prickles is eleven inches; and it is a quarter of an inch in diameter at the root, being thicker there than towards the extremity; the point seems broken off. The part however which most distinguishes this animal is the head; which though small, like that of an ostrich, does not fail to inspire some degree of terror. It is bare of feathers, and is armed with a helmet of horny substance, that covers it from the root of the bill to near half the head backwards. This helmet is black before and yellow behind. Its substance is very hard, being formed by the elevation of the bone of the skull; and it consists of several plates, one over another, like the horn of an ox. Some suppose that this is shed every year with the feathers; but the most probable opinion is that it only exfoliates slowly like the beak. To the peculiar oddity of this natural armour may be added the color of the eye in this animal, which is a bright yellow; and the globe being, above an inch and a half in diameter, gives it an air equally fierce and extraordinary. The hole of the ear is very large and open, being only covered with small black feathers. The sides of the head, about the eye and ear, being destitute of any covering, are blue, except the middle of the lower eye-lid, which is white. The part of the bill which answers to the upper jaw in other animals is very hard at the edges above, and the extremity of it is like that of a turkey cock. The end of the lower mandible is slightly notched, and the whole is of a grayish brown, except a green spot on each side. As the beak

admits a very wide opening, this contributes much to the bird's menacing appearance. The neck is of a violet-color, inclining to that of slate; and it is red behind in several places, but chiefly in the middle. About the middle of the neck before, at the rise of the large feathers, there are two processes formed by the skin, which resemble somewhat the gills of a cock, but that they are blue as well as red. The skin which covers the fore part of the breast, on which this bird leans and rests, is hard, callous, and without feathers. The thighs and legs are covered with feathers, and are extremely thick, strong, straight, and covered with scales of several shapes; but the legs are thicker a little above the foot than in any other place. The toes are likewise covered with scales, and are but three in number; for that which should be behind is wanting. The claws are of a hard solid substance, black without and white within. The internal parts are equally remarkable. The cassowary unites with the double stomach of animals that live upon vegetables the short intestines of those that live upon flesh. The intestines of the cassowary are thirteen times shorter than those of the ostrich. The heart is very small, being but an inch and a half long, and an inch broad at the base. Upon the whole it has the head of a warrior, the eye of a lion, the defence of a porcupine, and the swiftness of a courser. Thus formed for a life of hostility, for terrifying others, and for its own defence, it might be expected that the cassowary was one of the most fierce and terrible animals of the creation. But nothing is so opposite to its natural character; it never attacks others; and, instead of the bill, when attacked, it rather makes use of its legs, and kicks like a horse, or runs against its pursuer, beats him down, and treads him to the ground. The manner in which this animal moves is not less extraordinary than its appearance. Instead of going directly forward it seems to kick up behind with one leg; and then, making a bound onward with the other, it goes with such prodigious velocity that the swiftest racer would be left far behind. The voraciousness of the ostrich obtains as strongly here. The cassowary swallows every thing that comes within the capacity of its gullet. The Dutch assert that it can devour not only glass, iron, and stones, but even burning coals, without testifying fear or injury. It is said, that the passage of the food through its gullet is performed so speedily, that even the eggs which it has swallowed whole pass through it unbroken. In fact, the alimentary canal of this animal, being extremely short, it may happen that many kinds of food are indigestible in its stomach, as wheat or currants are to man when swallowed whole. The cassowary's eggs are of a gray ash color, inclining to green. They are marked with a number of little tubercles of a deep green, and the shell is not very thick. The largest of these is fifteen inches round, one way, and about twelve the other. The southern parts of the East Indies seem to be the natural climate of the cassowary. His domain begins where that of the ostrich terminates. The latter has never been found beyond the Ganges; while the cassowary is never seen nearer than the islands of Banda, Sumatra, Java,

the Molucca Islands, and the corresponding parts of the continent. Yet even here this animal seems not to have multiplied in any considerable degree, as we find one of the kings of Java making a present of one of these birds to the captain of a Dutch ship, considering it as a very great rarity.

2. *S. casuarius* Novæ Hollandiæ, the New Holland cassowary, differs considerably from the common cassowary. It is a much larger bird, standing higher on its legs, and having the neck longer than in the common one. Total length seven feet two inches. The bill is not greatly different from that of the common cassowary; but the horny appendage or helmet on the top of the head in this species is totally wanting: the whole of the head and neck is also covered with feathers, except the throat and fore part of the neck about half way, which are not so well feathered as the rest; whereas in the common cassowary the head and neck are bare and carunculated as in the turkey. * The plumage in general consists of a mixture of brown and gray, and the feathers are somewhat curled or bent at the ends in the natural state: the wings are so very short as to be totally useless for flight, and indeed are scarcely to be distinguished from the rest of the plumage, were it not for their standing out a little. The long spines which are seen in the wings of the common sort are in this not observable, nor is there any appearance of a tail. The legs are stout, formed much as in the preceding, with the addition of their being jagged or sawed the whole of their length at the back part. This bird is common in New Holland and Botany Bay. Though it cannot fly, it runs so swiftly that a greyhound can scarcely overtake it. The flesh is said in taste to resemble beef.

STRUTHIOLA, in botany, a genus of the monogynia order and tetrandria class of plants: cor. wanting: cal. tubulous, with eight glandules at its mouth; the berry is without juice, and monospermous. There are three species, viz., 1. *S. erecta*; 2. *S. nana*; and 3. *S. virgata*; which are all plants of foreign extraction.

STRUTHIONES, in ornithology, struthious birds, a new order of birds, very properly classed by Dr. Latham as distinct from the gallæ, with which they were formerly classed by Linnæus. It consists of the didus, or doda (see *Didus*); the rhea, or American ostrich (see *Rhea*); and the ostrich and cassowary. See *Struthio*.

STRUTHIOPHAGI, an ancient nation of Ethiopia, so called from eating ostriches. See *Ethiopia*.

STRUTHIOUS, from *struthio*. Of or belonging to the ostrich, or to that order of birds.

STRUVIUS (George Adam), a learned German, born at Magdeburg in 1619. He became professor of jurisprudence at Jena, and counsellor to the duke of Saxony. In 1653 he published a great work, entitled *Syntagma Juris Feudalis*; and in 1663 another entitled *Syntagma Juris Civilis*. He died in 1692 aged seventy-three.

STRUVIUS (Burchard Gotthelf), son of the preceding, was born at Weimar in 1761. He settled at Jena; followed his father's profession, and was much esteemed for his learning and integrity. He published many works, and died in 1738, aged sixty-seven.

STRY, a circle of Austrian Poland, between Hungary and the circle of Lemberg. It is one of the largest in Galicia, having a superficial extent of 3100 square miles. Its appearance differs completely in the south and north, the former consisting almost entirely of mountains, the latter of extensive plains. A single large river (the Dniester) traverses it from west to east, and then from north to south; it is intersected in various directions by smaller streams.

STRY, or **STRYI**, a town of Austrian Galicia, the capital of the above circle, stands on a small river of the same name, which divides here into a number of branches. It is surrounded with a wall and ditch, has a castle, a Catholic and a united Greek church, with a circular school, and 5500 inhabitants. Thirty-five miles W. N. W. of Halicz, and forty-two south of Lemberg.

STRYCHNIA, or **STRYCHNINE**, is an alkaline substance obtained from the bean of the *strychnos ignatia* by the following process:—The bean was rasped down as small as possible. It was then exposed to the action of nitric ether in a Papin's digester. The residue, thus deprived of a quantity of fatty matter, was digested in alcohol as long as that re-agent was capable of dissolving any thing. The alcoholic solutions were evaporated to dryness, and the residue redissolved in water. Caustic potassa being dropped into the solution a white crystalline precipitate fell, which was strychnia. It was purified by washing it in cold water, dissolving it in alcohol, and crystallising it. Strychnia was obtained likewise from the bean of the *strychnos ignatia*, by boiling the infusion of the bean with magnesia, in the same manner as Robiquet had obtained morphia from the infusion of opium.

The properties of strychnia, when in a state of purity, are as follows:—It is crystallised in very small four-sided prisms, terminated by four-sided low pyramids. It has a white color; its taste is intolerably bitter, leaving a metallic impression in the mouth. It is destitute of smell. It is not altered by exposure to the air. It is neither fusible nor volatile, except at temperatures at which it undergoes decomposition. It is charred at the temperature at which oil enters into ebullition (about 580°). When strongly heated it swells up, blackens, gives out empyreumatic oil, a little water, and acetic acid; carbonic acid and carburetted hydrogen gases are disengaged, and a bulky charcoal remains behind. When heated with peroxide of copper it gives out only carbonic acid gas and water. It is very little soluble in cold water, 100,000 parts of that liquor dissolving only fifteen parts of strychnia; but it dissolves in 2500 times its weight of boiling water. A cold solution of strychnia in water may be diluted with 100 times its volume of that liquid, without losing its bitter taste. When strychnia is introduced into the stomach it acts with prodigious energy. A locked jaw is induced in a very short time, and the animal is speedily destroyed. Half a grain of strychnia blown into the throat of a rabbit proved fatal in five minutes, and brought on locked jaw in two minutes.

Sulphate of strychnia is a salt which crystallises in transparent cubes, soluble in less than ten

times its weight of cold water. Its taste is intensely bitter, and the strychnia is precipitated from it by all the soluble salifiable bases. It is not altered by exposure to the air.

Muriate of strychnia crystallises in very small needles, which are grouped together, and before the microscope exhibit the form of quadrangular prisms. When exposed to the air it becomes opaque. It is more soluble in water than the sulphate, has a similar taste, and acts with the same violence upon the animal economy as all the other salts of strychnia.

Phosphate of strychnia crystallises in four-sided prisms. It can only be obtained neutral by double decomposition.

Nitrate of strychnia can be obtained only by dissolving strychnia in nitric acid, diluted with a great deal of water. The saturated solution, when cautiously evaporated, yields crystals of neutral nitrate in pearly needles. This salt is much more soluble in hot than in cold water. Its taste is exceedingly bitter, and it acts with more violence upon the animal economy than pure strychnia. It seems capable of uniting with an excess of acid. When heated it becomes yellow, and undergoes decomposition. It is slightly soluble in alcohol, but it is insoluble in ether. When concentrated nitric acid is poured upon strychnia it immediately strikes an amaranthine color, followed by a shade similar to that of blood. To this color succeeds a tint of yellow, which passes afterwards into green. By this action the strychnia seems to be altered in its properties, and to be converted into a substance still capable of uniting with acids.

Carbonate of strychnia is obtained in the form of white flocks, little soluble in water, but soluble in carbonic acid. Acetic, oxalic, and tartaric acids, form with strychnia neutral salts, which are very soluble in water, and more or less capable of crystallising. They crystallise best when they contain an excess of acid. The neutral acetate is very soluble, and crystallises with difficulty.

Hydrocyanic acid dissolves strychnia, and forms with it a crystallisable salt. Strychnia combines neither with sulphur nor carbon. When boiled with iodine a solution takes place, and iodate and hydriodate of strychnia are formed. Chlorine acts upon it precisely in the same way. Strychnia, when dissolved in alcohol, has the property of precipitating the greater number of metallic oxides from their acid solutions. It is precipitated by the alkalis and alkaline earths; but the effect of the earths proper has not been tried.

STRYCHNOS, or **STRYCHNUS**, in botany, a genus of the monogynia order and pentandria class of plants; natural order twenty-eighth, luridæ: cor. quinquefid: berry unilocular, with a wooden bark. The species are four; viz. 1. *S. colubrina*; 2. *S. ignatii*; 3. *S. nux vomica*; 4. *S. potatorum*; are all natives of foreign countries. See **NUX VOMICA**.

STRYMA, an ancient town of Thrace, founded by a Thracian colony.—Herodotus vii. 109.

STRYMON, in ancient geography, a river constituting the ancient limits of Macedonia and Thrace; rising in Mount Scombus (Aristotle),

and formerly called Conozus. Authors differ as to the modern name of this river.

STRYPE (John), an English divine, descended from a German family, born at London and educated at Cambridge. He was vicar of Low Layton in Essex, and distinguished himself by his compilations of Lives and Memoirs, in which, as Dr. Birch remarks, his fidelity and industry will always give a value to his writings, however destitute they may be of the graces of style. He died in 1737, after having enjoyed his vicarage nearly sixty-eight years.

STUART (lady Arabella), daughter of Charles, earl of Lennox, the younger brother of Henry, lord Darnley, husband of queen Mary and king of Scotland. Her mother was Elizabeth, daughter of Sir William Cavendish. Lady Arabella was born in 1577, but her near relation to the royal family only involved her in trouble. About the end of queen Elizabeth's reign, the pope formed the plan of placing her on the throne of England, and marrying her to cardinal Farnese, brother to the duke of Parma. The project was approved by the French court; and after the accession of James VI. some English peers entered seriously into the scheme. But, the plot being discovered, some of the conspirators were executed. Some time after this she was privately married to the honorable William Seymour, son of the earl of Hertford; but James hearing of it committed them both prisoners to the tower. Seymour escaped from prison and got off to France. Lady Arabella accompanied him; but was taken and remanded to the tower, where she died in 1615; adding one more to the number of unfortunate royal Stuarts.

STUART (Sir Charles), an English general, son of the marquis of Bute, was born in 1753. After having been presented at the principal European courts, he entered into the army, and was appointed aid-de-camp to the viceroy of Ireland. In 1775 he was sent to America, where he distinguished himself; and at the beginning of the late war was made a major-general, and employed in the Mediterranean. Here he made himself master of Corsica, and, after having conciliated the minds of the inhabitants towards the British government, returned home in 1796. His next service was in Portugal, whither he was sent at the beginning of 1797, at the head of an auxiliary corps of 8000 men; and not only secured the country against the hostile designs of the French directory, but also contributed to the future success of the British arms in the Peninsula. In 1798 he distinguished himself by the conquest of Minorca, which he had scarcely completed when he was summoned to the defence of Sicily, which he effectually guarded from the French. At the close of the same year he was ordered to Malta; and, after having taken the fortress of La Valette by blockade, returned to England: to his representations it was owing that the British government retained possession of that island. He died in 1801, leaving two sons.

STUART (James Edward Francis), the eldest son of James II., by his second wife, Mary of Modena, was born in London June 10th, 1688; and was but five months old when his father was dethroned, and his mother with her infant

fled to France. He was the child with whom this unfortunate princess is said to have stood for some time in a bleak night under the shelter of Lambeth church wall, waiting for a boat. An attempt was made at the peace of Ryswick, in 1697, to insure the future restoration of this young prince to the throne of England: an attempt defeated only by the opposition of his father, as William III. had agreed to procure the recognition of the prince of Wales, as he was styled, as his successor. On the death of the ex-king, in 1701, Louis XIV. recognized his son as king of England, by the title of James III., and a proclamation in the name of the latter was addressed to the English nation; but no measures were at this time adopted in his favor. The death of William III. revived his hopes; but nothing beyond unavailing negotiation took place till 1708, when a maritime expedition against Scotland was fitted out, in which the prince embarked. The armament, however, being attacked by an English fleet of superior force, returned to France without landing; and the young adventurer (who now assumed the name of the chevalier de St. George) joined the French army in Flanders, and distinguished himself at the battle of Malplaquet. In the latter part of the reign of Anne several intrigues were set on foot to secure the restoration of her brother, or his succession to the crown after her death; but on the treaty of Utrecht taking place in 1713 he was obliged to submit to a retirement from France, and when he returned to Paris resided there incognito. The regent duke of Orleans wished to maintain peace with George I.; and the British ambassador at Paris was informed of the projects of the chevalier de St. George by the abbé Strickland, one of his agents, who betrayed his confidence. When, therefore, the earl of Mar raised in Scotland the standard of the Stuarts, and proclaimed this prince under the title of James VIII.; and the latter embarking at Dunkirk, made a descent on the Scottish coasts; he soon perceived that success was hopeless, and was obliged to return to France. But that kingdom no longer yielded him an asylum, and he was forced to remove first to Avignon and then to Rome. The prince was a few years after invited to Spain, where he was well received by Philip V.; but the visit had no important influence on his affairs, and Rome again became his retreat. In 1720 he married Mary Casimira Sobieska, grand-daughter of the famous John Sobieski, king of Poland, a union not attended with domestic happiness, and a separation between the husband and wife was with difficulty prevented. He took no active part in the expedition against Scotland under his son in 1745, and died January 2d, 1766.

STUART (Charles Edward Louis Philip Casimir), son of the preceding, known by the appellation of the young pretender, was born at Rome December 31st, 1720. In his youth he was called the count of Albany, and under that title travelled in the north of Italy, and visited Parma, Genoa, and Milan. The war which broke out between England and France, in 1740, inspired the exiled family with hopes, and excited the young prince to risk his person in a

memorable attempt towards the recovery of the British throne. In June 1745 he embarked with a few followers at Nantes, and, landing on the western coast of Scotland, found himself ere long at the head of a considerable army. Having taken possession of Perth, he proclaimed his father king of England, Scotland, and Ireland, by the style of James III., and himself regent. The submission of Edinburgh, and the victory of Prestonpans, raised the hopes of his adherents, and induced them to march into England; where they proceeded as far as Derby; but disappointed in his hopes of a general insurrection, and alarmed at the approach of an English army, the prince found it necessary to return. The battle of Falkirk, which he gained in January 1746, was his last success; for he was soon after obliged to raise the siege of Stirling, and the decisive battle of Culloden, fought on the 27th of April, gave the death blow to his hopes. For several succeeding months the young pretender suffered the miseries and privations of a wretched outcast. At length he embarked on board a French vessel, and, after escaping some English cruisers, landed in safety at St. Pol de Leon in Brittany, October 10th, 1746. On the signature of the treaty of Aix-la-Chapelle, two years after his return, he found himself obliged to quit France. He then went to reside at Rome. In 1755 the French ministers, in consequence of disputes with the English government, appear to have projected a new invasion; and Charles Edward went to Nancy, and held a conference on the subject with count Lally; but, the differences between the two governments being adjusted, the design of invasion was relinquished, and the prince returned to Rome. He soon after married the young princess of Stolberg Gædern; but this union did not answer the views of any of the parties concerned in it. He had no children by his wife, whom he appears to have used in a brutal manner, which induced her at length to take refuge in a convent in Florence; and she subsequently found an asylum with her brother-in-law, the cardinal of York, at Rome. Charles Edward Stuart spent the latter part of his life at Florence, abandoned to the lowest sensual indulgences; and died in that city January 31st, 1788. He is said to have been in England in 1753, when lord Holderness, enquiring of George II. what should be done with him, the king said, 'Nothing; when he is tired of staying here, let him go away.' It has been also asserted that he came here again at the period of the coronation of his late majesty.

STUART (Henry Benedict Maria Clement), cardinal of York, younger brother of the preceding, the last descendant of the royal line of the Stuarts, was born at Rome, March 20th, 1725, and, being destined for the church, the Pope bestowed on him the right to hold benefices without receiving the ecclesiastical tonsure. In 1745, when the last effort was made for the restoration of his family, he went to France, and assumed the command of troops assembled at Dunkirk; but the battle of Culloden prevented the embarkation of this armament, and prince Henry returned to Rome. He now took holy orders, and in 1747 pope Benedict XIV. raised

him to the purple: he was subsequently made chancellor of the Basilic of St. Peter, and bishop of Frescati. On the death of his brother in 1788 he assumed the title to which the family had aspired; and on that occasion caused a medal to be struck, with the inscription 'Henricus nonus, Angliæ Rex;' and on the obverse, 'Gratia Dei, non Voluntate Hominum.' Succeeding events had the singular effect of rendering the cardinal of York a dependent on the bounty of the late king of England; for, when the French conquered Italy, he was obliged to flee to Venice, and was indebted for his support to a pension from our court. In 1801 he returned to Rome, and became dean of the sacred college. His death took place in 1807.

STUART (Gilbert), LL. D., son of George Stuart, professor of humanity at Edinburgh, was born in 1746. Having finished his classical studies in the university, he applied himself to jurisprudence, without probably intending to follow the profession of the law. For that profession he has been represented as unqualified by indolence; by a passion which at a very early period of life he displayed for general literature; or by boundless dissipation:—and all these circumstances may have contributed to make him relinquish pursuits in which he could hope to succeed only by patient perseverance and strict decorum of manners. That he did not waste his youth in idleness, is, however, evident from An Historical Dissertation concerning the Antiquity of the British Constitution, which he published before he had completed his twenty-second year, and which had so much merit as to induce the university of Edinburgh to confer upon the author, though so young a man, the degree of LL. D. After a studious interval of some years, he produced a valuable work, under the title of A View of Society in Europe, in its Progress from Rudeness to Refinement: or, enquiries concerning the History of Laws, Government, and Manners. He had read and meditated with patience on the most important monuments of the middle ages: and in this volume (which speedily reached a second edition) he aimed chiefly at the praise of originality and invention, and discovered an industry that is seldom connected with ability and discernment. About the time of the publication of the first edition of this performance, having turned his thoughts to an academical life, he asked for the professorship of public law in the university of Edinburgh. According to his own account he had been promised that place by the minister, but had the mortification to see the professorship bestowed on another, and all his hopes blasted by the influence of Dr. Robertson, whom he represented as under obligations to him. This part of the story, however, seems very incredible; as it is not easy to conceive how it ever could be in the power of Dr. Stuart to render to the learned principal any essential service. It was believed indeed by the earl of Buchan, and by others, who observed that the illiberal jealousy not unfrquent in the world of letters was probably the source of this opposition; which enirely broke the intimacy of two persons who, before that time, were understood to be on the most friendly footing with

each other. Ingratitude, however, is as likely to have been the vice of Dr. Stuart as of Dr. Robertson; for we have been told by a writer (Chalmers, in his Life of Ruddiman), who, at least in one instance, has completely proved what he affirms, that, 'such was Gilbert Stuart's laxity of principle as a man, that he considered ingratitude as one of the most venial sins; such was his conceit, as a writer, that he regarded no one's merits but his own; such were his disappointments, both as a writer and a man, that he allowed his peevishness to sour into malice, and indulged his malevolence till it settled in corruption.' Soon after this disappointment Dr. Stuart went to London, where he became, from 1768 to 1774, one of the writers of the Monthly Review. In 1772 Dr. Adam, rector of the high school of Edinburgh, published a Latin grammar, which he intended as an improvement of the famous Ruddiman's. Stuart attacked him in a pamphlet under the name of Bushby, and treated him with much severity. In doing this, he was probably actuated more by some personal dislike of Dr. Adam than by regard for the memory of his learned relation; for on other occasions he showed sufficiently that he had no regard to Ruddiman's honor, as a grammarian, editor, or critic. In 1774 he returned to his native city, and began the Edinburgh Magazine and Review, in which he discussed the liberty and constitution of England, and distinguished himself by an enquiry into the character of John Knox the reformer, whose principles he reprobated in the severest terms. About this time he revised and published Sullivan's Lectures on the Constitution of England. Soon after he turned his thoughts to the history of Scotland, and published Observations concerning its Public Law and Constitutional History; in which he examined with critical care the preliminary book to Dr. Robertson's History. His next work was the History of the Reformation; a book which deserves praise for the easy dignity of the narrative, and for strict impartiality. His last great work, The History of Scotland from the Establishment of the Reformation to the death of Queen Mary, which appeared in 1782, has been very generally read and admired. His purpose was to vindicate the character of the injured queen, and expose the weakness of the arguments by which Dr. Robertson had endeavoured to prove her guilty; but, though the style of this work is his own, it contains very little matter which was not furnished by Goodall and Tytler; and it is with the arms which these two writers put into his hands that Dr. Stuart vanquished his great antagonist. In 1782 he once more visited London, and engaged in the Political Herald and English Review; but, the jaundice and dropsy increasing on him, he returned by sea to his native country, where he died, in the house of his father, on the 13th of August 1786. In his person, Dr. Stuart was about the middle size and justly proportioned. His countenance was modest and expressive, sometimes glowing with sentiments of friendship, of which he was truly susceptible, and at others darting that satire and indignation at folly and vice which appear in some of his writings. He was a boon companion; and, with a constitution

that might have stood the shock of ages, he fell a premature martyr to intemperance. His talents were certainly great, and his writings are useful; but he seems to have been influenced more by passion than principle, and in his character there was not much to be imitated. Of his style in writing, see our article LANGUAGE.

STUART (James), a celebrated architect and antiquary, born in London in 1709. His father, who was a mariner, died while James was a boy, leaving a widow and four children, of whom he was the eldest, without any means of support. James, having an excellent turn for drawing, soon provided for the whole family, by painting fans. He soon after found a place for one of his sisters with his employer in the fan trade. Mean time he made astonishing exertions and acquisitions in various branches of learning. To perfect himself in drawing, he studied anatomy, geometry, the mathematical sciences in general, and at last, wishing to understand the Latin inscriptions on prints, he made himself master of that language, and soon after of the Greek, all by his own exertions without a teacher. His mother dying, after procuring places for his brother and second sister, he set out upon his travels to the continent on foot. He travelled through Holland and France to Paris, stopping occasionally at different towns, only so long as to gain as much as would carry him forward. At length he arrived at Rome, where he attracted the attention and patronage of Sir Jacob Bouverie and Mr. Dawkins, who were astonished at his courage and perseverance. Here he also formed an intimacy with Mr. Revett the celebrated architect. Under the auspices of these gentlemen, Revett and he set out for Athens, where they remained several years, and made a number of drawings of the relics of ancient architecture. About this period, too, he engaged as chief engineer in the army of the empress queen of Hungary. When the campaign was over, he went back to Athens, and completed his drawings, which on his return to England, after fourteen years absence, he engraved and published, to the surprise and gratification of the learned world. The first volume was published in 1762, under the title of Antiquities of Athens. This work, with the fame of his travels, procured him the title of Athenian Stuart. Upon his arrival, he had been received into Mr. Dawkin's family; and lord Anson, admiring his genius and exertions, appointed him surveyor of Greenwich hospital, which he held till his death. In 1781, after studying Grecian antiquities for seventy-two years, he fell in fancy with a modern British beauty, an accomplished young lady of Sittingbourne in Kent, only in her twentieth year. Disparity of years were not objected to on the lady's part. They were married, and she bore him four children. This extraordinary genius died in 1788, aged seventy-nine; and other 2 vols. of his Antiquities of Athens have been published since his death.

STUB, *n. s. & v. a.* Sax. *steb*; Belg. and Dan. *stubbe, stob*; Lat. *stipes*. A stump; a thick short stock left when the rest is cut off: to force up; extirpate.

To buy at the *stub* is the best for the buyer, More timely provision the cheaper is fire. *Tusser.*

Dametus guided the horses so ill, that the wheel coming over a great *stub* of a tree, overturned the coach. *Sidney.*

All about old stocks and *stubs* of trees,
Whereon nor fruit nor leaf was ever seen,
Did hang upon the ragged rocky knees. *Spenser.*

Upon cutting down of an old timber tree, the *stub* hath put out sometimes a tree of another kind. *Bacon's Natural History.*

A pain he in his head piece feels,
Against a *stubbed* tree he reels,
And up went poor Hobgoblin's heels. *Drayton.*

To spight the coy nymphs,
Hang upon our *stubbed* horns
Garlands, ribbons, and fine poesies. *Ben Jonson.*

You shall have more ado to drive our dullest and laziest youth, our stocks and *stubs*, from the infinite desire of such a happy nurture, than we have now to haul our choicest wits to that asinine feast of sow thistles and brambles. *Milton.*

Prickly *stubs* instead of trees are found,
Or woods with knots and knaers deformed and old;
Headless the most, and hideous to behold. *Dryden.*

His two tusks serve for fighting and feeding; by the help whereof he *stubs* up edible roots out of the ground, or tears off the bark of trees. *Grew's Museum.*

The base is surrounded with a garland of black and *stubby* bristles. *Id.*

The other tree was grieved,
Grew scrubby, dried a-top, was stunted;
So the next parson *stubbed* and burnt it. *Swift.*

STUBBE (Henry), an English writer of uncommon talents, born at Partney in Lincolnshire, 28th February 1631. His father was a minister of the church of England, but turning Baptist was ejected and went with his family to Ireland. But the rebellion breaking out, in 1641, the mother returned to England with her son, and settling in London, where she maintained herself by sewing, sent Henry to Westminster school. The boy's talents were soon observed by Dr. Busby, the master, who recommended him to Sir Henry Vane, and these two patronised him, and supplied him with money, books, &c., to complete his education. In 1649 he was elected student of Christ Church, Oxford; and in 1657 was made under keeper of the Bodleian library; but was ejected upon the restoration, having made himself obnoxious by his publications on the other side. He then went to Stratford-upon-Avon, where he practised physic. In 1661 he went to Jamaica, with the title of king's physician; but, the climate disagreeing with him, he returned; and engaged in a violent controversy with the Royal Society. After various other literary controversies, and publishing many books, which are now no longer read, he was drowned on crossing a river, July 12th 1676.

STUBBS (George), an ingenious English writer, who was rector of Graville, in Dorsetshire. He wrote many of the best papers in the *Freethinker*, in 1718, in conjunction with Ambrose Philips, and others. He also published *A New Adventure of Telamachus*; 2. *A Dialogue on Beauty between Socrates and Aspasio*, in the manner of Socrates; and, 3. *A Translation of Madam Sevigne's Letters*, the first that ever appeared in English, and much in the spirit of the original.

STUBBS (George), was born in 1724 at L-

verpool, where, in early life, he was distinguished by his anatomical pursuits. At the age of thirty he went to Rome for improvement, and on his return settled in the metropolis. In 1766 he published the Anatomy of the Horse; all the plates of which were drawn and engraved by himself. As a painter of animals, particularly the race courser, he was not excelled by any of his contemporaries, and his pictures of the Lion and Horse, and the Lion and Stag, were deservedly applauded. Mr. Stubbs was also the inventor of a species of painting landscapes on large plates of enamel; and he published several prints, chiefly of animals. At the time of his death he was employed on a work entitled a Comparative Anatomical Exposition of the Structure of the Human Body, with that of a Tiger and Common Fowl. He was a man of such muscular strength that he has more than once carried a dead horse on his back up two pair of stairs to his dissecting room on the attic floor. He was an associate of the Royal Academy, and died in 1806.

STUB'BLE, *n. s.* Fr. *estouble*; Lat. *stipula*. The stalks of corn left in the field by the reaper.

This suggested
At some time, when his soaring insolence
Shall reach the people, will be the fire
To kindle their dry *stubble*, and their blaze
Shall darken him for ever. *Shakespeare.*

You, by thus much scene,
Know by the *stubble* what the corne hath beene.

Chapman.
If a small red flower in the *stubble* fields, called the wincopipe, open in the morning, be sure of a fair day. *Bacon.*

His succeeding years afford him little more than the *stubble* of his own harvest. *Dryden.*
After the first crop is off, they plow in the wheat *stubble*. *Mortimer's Husbandry.*

Thrice happy Dick employed in threshing *stubble*,
Thy toil is lessened, and thy profits double. *Swift.*

STUB'BORN, *adj.* } Derived from Minshew
STUB'BORNLY, *adv.* } from stoutborn; referred
STUB'BORNNESS, *n. s.* } ed by Junius to $\sigma\upsilon\beta\alpha\rho\delta\acute{o}\varsigma$;
and deduced better by Mr. Lye from *Stub*, perhaps from stub-horn.—Johnson. There is a Belgic *stuyvern*, of the same meaning. Obstinate; inflexible; stiff; contumacious; hardy; firm: the adverb and noun substantive corresponding.

The queene is obstinate,
Stubborn to justice, apt t' accuse it, and
Disdainful to be tried by 't.

Shakespeare. Henry VIII.
Stubbornly he did repugn the truth,
About a certain question in the law.

Id. Henry VI.
He chose a course least subject to envy, between stiff *stubbornness* and filthy flattery. *Hayward.*

Then stood he neere the doore, and proud to draw
The *stubborne* bow, thrice tried, and thrice gave law. *Chapman.*

He believed he had so humbled the garrison that they would be no longer so *stubborn*. *Clarendon.*

I'll not flatter this tempestuous king,
But work his *stubborn* soul a nobler way. *Dryden.*

Take a plant of *stubborn* oak,
And labour him with many a sturdy stroke. *Id.*

Patriots, in peace, assert the people's right,
With noble *stubbornness* resisting might. *Id.*

Stubbornness, and an obstinate disobedience must be mastered with blows. *Locke.*

All this is to be had only from the epistles themselves, with *stubborn* attention, and more than common application. *Id.*

He wilfully neglects his book, and *stubbornly* refuses any thing he can do. *Id.*

Patience under torturing pain,
Where *stubborn* stoicks would complain. *Swift.*

STUCCO, *n. s.* Ital. *stucco*; Fr. *stuc*. A kind of fine plaster for walls.

Palladian walls, Venetian doors,
Grottesco roofs, and *stucco* floors. *Pope.*

Stucco, in building, is a composition of white marble pulverised, and mixed with plaster of lime; and the whole, being sifted and wrought up with water, is used like common plaster: this is called by Pliny marmoratum opus, and albarium opus.

A patent has been granted to Mr. B. Higgins for inventing a new kind of stucco, or water cement, more firm and durable than any heretofore. Its composition, as extracted from the specification signed by himself, is as follows:—'Drift-sand, quarry, or pit-sand, which consists chiefly of hard quartose flat-faced grains with sharp angles; which is the freest, or may be easily freed by washing, from clay, salts, and calcareous, gypseous, or other grains less hard and durable than quartz; which contains the smallest quantity of pyrites or heavy metallic matter inseparable by washing; and which suffers the smallest diminution of its bulk in washing in the following manner—is to be preferred before any other. And where a coarse and fine sand of this kind, and corresponding in the size of their grains with the coarse and fine sands hereafter described, cannot be easily procured, let such sand of the foregoing quality be chosen as may be sorted and cleansed in the following manner: Let the sand be sifted, in streaming clear water, through a sieve which will give passage to all such grains as do not exceed one-sixteenth of an inch in diameter; and let the stream of water and the sifting be regulated so that all the sand, which is much finer than the Lynn-sand commonly used in the London glass-houses, together with clay and every other matter specifically lighter than sand, may be washed away with the stream, whilst the purer and coarser sand, which passes through the sieve, subsides in a convenient receptacle, and whilst the coarse rubbish and rubble remain on the sieve to be rejected. Let the sand which thus subsides in the receptacle be washed in clean streaming water through a finer sieve, so as to be further cleansed and sorted into two parcels; a coarser, which will remain in the sieve, which is to give passage to such grains of sand only as are less than one-thirtieth of an inch in diameter, and which is to be saved apart under the name of coarse sand; and a finer, which will pass through the sieve and subside in the water, and which is to be saved apart under the name of fine sand. Let the coarse and the fine sand be dried separately, either in the sun or on a clean iron plate, set on a convenient surface, in the manner of a sand-heat, and stirred continually till dried, else it will be discolored. Let lime be chosen, which is stone-lime, which heats the most in slaking, slakes the quickest when duly watered. is the

freshest made and closest kept; dissolves in distilled vinegar with the least effervescence, and leaves the smallest residue insoluble, and in this residue the smallest quantity of clay, gypsum, or martial matter. Let fourteen pounds of the lime thus chosen be put in a brass-wired sieve; let the sieve be finer than either of the foregoing; let the lime be slaked by plunging it in a butt filled with soft water; raising it out quickly, and suffering it to heat and fume; by repeating this plunging and raising alternately, and agitating the lime, until it be made to pass through the sieve into the water; let the part of the lime which does not easily pass through the sieve be rejected; let fresh portions of the lime be thus used until as many ounces of lime have passed through the sieve as there are quarts of water in the butt. Let the water thus impregnated stand in the butt closely covered until it becomes clear; and through wooden coeks, placed at different heights in the butt, let the clear liquor be drawn off as fast and as low as the lime subsides for use. This clear liquor I call the cementing liquor. The freer the water is from saline matter the better will be the cementing liquor made with it. Let fifty-six pounds of the chosen lime be slaked, by gradually sprinkling on it, and especially on the unslaked pieces, the cementing liquor, in a close clean place. Let the slaked part be immediately sifted through the last-mentioned fine brass-wired sieve: let the lime which passes be used instantly, or kept in air-tight vessels, and let the part of the lime which does not pass through the sieve be rejected. This finer richer part of the lime which passes through the sieve I call purified lime. Let bone ash be prepared in the usual manner, by grinding the whitest burnt bones, but let it be sifted, to be much finer than the bone ash commonly sold for making eupels. The most eligible materials for making my cement being thus prepared, take fifty-six pounds of the coarse sand and forty-two pounds of the fine sand; mix them on a large plank of hard wood placed horizontally; then spread the sand so that it may stand to the height of six inches, with a flat surface on the plank; wet it with the cementing liquor, and let any superfluous quantity of the liquor, which the sand in the condition described cannot retain, flow away off the plank. To the wettest sand add fourteen pounds of the purified lime in several successive portions, mixing and beating them up together in the mean time with the instruments generally used in making fine mortar: then add fourteen pounds of the bone ash in successive portions, mixing and beating them all together. The quicker and the more perfectly these materials are mixed and beaten together, and the sooner the cement thus formed is used, the better it will be. This I call the water cement coarse grained, which is to be applied in building, pointing, plastering, stuccoing, or other work, as mortar and stucco now are; with this difference chiefly, that as this cement is shorter than mortar or common stucco, and dries sooner, it ought to be worked expeditiously in all cases; and in stuccoing it ought to be laid on by sliding the trowel upwards on it; that the materials used along with this cement in building, or the

ground on which it is to be laid in stuccoing, ought to be well wetted with the cementing liquor, in the instant of laying on the cement, and that the cementing liquor is to be used when it is necessary to moisten the cement, or when a liquid is required to facilitate the floating of the cement. When such cement is required to be of a finer texture, take ninety-eight pounds of the fine sand, wet it with the cementing liquor, and mix it with the purified lime and the bone ash in the quantities and in the manner above described; with this difference only, that fifteen pounds of lime, or thereabouts, are to be used instead of fourteen pounds, if the greater part of the sand be as fine as Lynn sand. This I call water cement fine grained. It is to be used in giving the last coating, or the finish, to any work intended to imitate the finer grained stones or stucco. But it may be applied to all the uses of the water cement coarse grained, and in the same manner. When for any of the foregoing purposes of pointing, building, &c., such a cement is required much cheaper and coarser grained, then much coarser clean sand than the foregoing coarse sand, or well washed fine rubble, is to be provided. Of this coarse sand or rubble take fifty-six pounds, of the foregoing coarse sand twenty-eight pounds, and of the fine sand fourteen pounds; and after mixing these, and wetting them with the cementing liquor in the foregoing manner, add fourteen pounds or somewhat less of the purified lime, and then fourteen pounds or somewhat less of the bone ash, mixing them together as above. When my cement is required to be white, white sand, white lime, and the whitest bone ash are to be chosen. Gray sand, and gray bone ash formed of half burnt bones, are to be chosen to make the cement gray; and any other color of the cement is obtained either by choosing colored sand, or by the admixture of the necessary quantity of colored tale in powder, or of colored vitreous or metallie powders, or other durable coloring ingredients commonly used in paint. To the end that such a water cement as I have described may be made as useful as it is possible in all circumstances; and that no person may imagine that my claim and right under these letters patent may be eluded by divers variations, which may be made in the foregoing process without producing any notable defect in the cement; and to the end that the principles of this art, as well as the art itself of making my cement, may be gathered from this specification and perpetuated to the public; I shall add the following observations: This my water cement, whether the coarse or fine grained, is applicable in forming artificial stone, by making alternate layers of the cement and of flint, hard stone, or brick, in moulds of the figure of the intended stone, and by exposing the masses so formed to the open air to harden: but they must not be exposed to rain till they are as hard as Portland stone. When such cement is required for water fences, two-thirds of the prescribed quantity of bone ashes are to be omitted; and in the place thereof an equal measure of powdered terras is to be used; and, if the sand employed be not of the coarsest sort, more terras must be added, so that the terras shall be by weight one-sixth part

of the weight of the sand. When such a cement is required of the finest grain, or in a fluid form, so that it may be applied with a brush, flint powder, or the powder of any quartose or hard earthy substance, may be used in the place of sand; but in a quantity smaller, as the flint or other powder is finer; so that the flint-powder, or other such powder, shall not be more than six times the weight of the lime, nor less than four times its weight. The greater the quantity of lime within these limits, the more will the cement be liable to crack by quick drying, and vice versâ. Where such sand as I prefer cannot be conveniently procured, or where the sand cannot be conveniently washed and sorted, that sand which most resembles the mixture of coarse and fine sand above prescribed may be used as I have directed, provided due attention is paid to the quantity of the lime, which is to be greater as the quantity is finer, and vice versâ. Sea sand well washed will answer. Where sand cannot be easily procured, any durable stony body, or baked earth grossly powdered, and sorted nearly to the sizes above prescribed for sand, may be used in the place of sand, measure for measure, but not weight for weight, unless such gross powder be as heavy specifically as sand. Sand may be cleansed from every softer, lighter, and less durable matter, and from that part of the sand which is too fine, by various methods, preferable, in certain circumstances, to that which I have described. Water may be found naturally free from fixable gas, selenite, or clay; such water may, without any notable inconvenience, be used in the place of the cementing liquor; and water approaching this state will not require so much lime as I have ordered to make the cementing liquor; and a cementing liquor sufficiently useful may be made by various methods of mixing lime and water in the described proportions, or nearly so. When stone lime cannot be procured, chalk lime or shell lime, which best resembles stone lime, in the characters above written of lime, may be used in the manner described, except that fourteen pounds and a half of chalk lime will be required in the place of fourteen pounds of stone lime. The proportion of lime which I have prescribed above may be increased without inconvenience, when the cement or stucco is to be applied where it is not liable to dry quickly; and in the contrary circumstance this proportion may be diminished; and the defect of lime in quantity or quality may be very advantageously supplied by causing a considerable quantity of the cementing liquor to soak into the work, in successive portions, and at distant intervals of time, so that the calcareous matter of the cementing liquor, and the matter attracted from the open air, may fill and strengthen the work. The powder of almost every well dried or burnt animal substance may be used instead of bone ash; and several earthy powders, especially the micaceous and the metallic; and the elixated ashes of divers vegetables whose earth will not burn to lime; and the ashes of mineral fuel, which are of the calcareous kind, but will not burn to lime, will answer the ends of bone ash in some degree. The quantity of bone ash

described may be lessened without injuring the cement, in those circumstances especially which admit the quantity of lime to be lessened, and in those wherein the cement is not liable to dry quickly. And the art of remedying the defects of lime may be advantageously practised to supply the deficiency of bone ash, especially in building, and in making artificial stone with this cement.

In the Transactions of the Society for the Encouragement of Arts, Commerce, &c., for 1811, we find the following, invented by H. B. Way, esq., of Bridport, strongly recommended, and apparently not without just reason: one part chalk lime, and three-parts fine sand collected on the sea-shore, near Bridport Harbour, the whole mixed up to a proper consistence with strong lime-water. Both the lime and sand should be finely sifted; and, when used as stucco, the first coat to be laid on half the thickness of a crown-piece; let it remain two days, then with a painter's brush wash it over with strong lime-water, and lay on the second coat of the same thickness. The cost of this is indeed very low; it is thus calculated by Mr. Way as his own expense:—

	<i>s. d.</i>
One sack and a quarter of lime,	3 1½
Two men and one boy, two days each,	
fetching and mixing up materials, and	
laying on; men 2s. 3d. per day, boy	
10d. per day, and one pint of ale each	
per day, 12d.	11 10½
	15 0

The space of wall covered with these materials amounted to twenty-five square yards; which is not more than 7½*d.* per yard. It was the outside wall of the inventor's house which was covered with this stucco, in a situation greatly exposed to the spray of the sea and bad weather; yet he adds, though writing five years after its application, that by means of this stucco his house is perfectly free from damp, and the plaster still remains compact and durable.

It is highly probable that the above stucco may, for many years to come, answer very well for the situation in which it has been employed; but, where the cement is required to be harder, or is wanted to resist water, it should be combined with a portion of some metallic oxide, as iron or lead, which give it a firmness equal to that of freestone: and hence the advantage of employing tarras or puzzolane in the composition of stuccoes or mortars for this purpose; this singular material being nothing more than a kind of ferruginous clay, or clay combined and intermixed with iron oxide, baked and calcined by the force of volcanic fire, and hence reduced to the form of a light, porous, friable mineral. It is usually obtained from the neighbourhood of Puteoli, and is thrown forth from the craters of Vesuvius. The only preparation it undergoes is that of pounding and sifting, by which it is comminuted to a coarse powder, after which it is beaten up into a due degree of consistency with a certain portion of lime, sometimes with and sometimes without sand. This kind of cement is of considerable antiquity: it was commonly em-

ployed by the Romans along the skirts of the bay of Baïæ, the most fashionable watering-place of this celebrated people, during their most luxurious era, in constructing the walls of their summer villas, which were often erected immediately on the shore. It was employed by Mr. Smeaton in building the Eddystone light-house, in the proportion of equal parts of puzzolane, and slaked Aberthaw lime, and is well known to have answered his fullest expectation. For works less exposed, however, as locks and basons for canals, the proportion of puzzolane may be diminished; and the cement employed on such occasions, and with great success, is the following: slaked Aberthaw lime two bushels, puzzolane one bushel, clean sand three bushels; the whole being beaten well together with the proper quantity of water so as to yield 4.67 cubic feet of stucco. It is in consequence of the property we have just ascribed to metallic oxides, of giving solidification to stuccoes, that the scales detached by hammering red-hot iron, and which are to be easily procured at the forges and blacksmiths' shops, are found so advantageous in compositions of this kind. Mr. Smeaton found by repeated experiments that these pounded and sifted, and incorporated with lime, produce a cement equal to puzzolane combined with lime in the same proportion. This material, he perceived also, renders common mortar capable of setting under water. Roasted iron-ore was found to answer the same purpose.

Coincidentally with these facts Mr. Kirwan observes that Zimmerman mixed one part filings of iron, and three parts sand, and sprinkled, or rather covered them with water, and let them stand six months, at the end of which period he found the vessel burnt by the expansion of the oxygenated iron, and the sand so firmly compacted that the mass thus formed could not be broken but by a chisel and hammer.—Henckel, *Origine des Pierres*, p. 405 in note. And that this induration may and does take place at great depths in the sea is evidently proved by the observations of Kinman (*Mem. Stockh. 1780*, related by Gadd), that an iron anchor long deposited in the sea had hardened into stone all the sand, clay, and shells which surrounded it, to a pretty considerable distance; and is further confirmed by a similar observation of Mr. Edward King, *Phil. Trans. 1779*, p. 35, that a violent storm having laid bare part of the wreck of a man of war, that had been stranded thirty-three years before, several masses, consisting of iron, ropes, and balls, were found covered over with a hard substance, which, upon examination, appeared to be sand concreted and hardened into a kind of stone; that which concreted round the rope retained the impression of that part of the ring to which the rope was fastened, in the same manner as the impressions of extraneous fossils are often found in various strata. Also round the iron handle of a brass cannon, that remained in the sea a much longer time, a much harder incrustation of sand was found, enclosing cockles, mussels, limpets, oysters, &c., all so firmly fixed, and converted into a substance so hard, that it required as much force to break them as to break the substance of any hard rock.'—*Geol. Essays*

A very valuable and curious preservation stucco was invented about fifty years ago by Mr. Bachalier of Paris, which was capable of being used in a very liquid state, so as not to injure the finest and most delicate sculpture, which, indeed, it was the direct object of this composition to protect. In this the metallic oxide seems to have been lead, and one of the principal ingredients the caseous part of cheese, so frequently used in our own country as an ingredient in cement for uniting broken pieces of glass and china. This stucco-composition of Mr. Bachalier has of late years been esteemed of so much value in France that a committee of the first French chemists, Berthollet, Chaptal, Vauquelin, Le Briton, and Gayton-Merveau, have been appointed by the Imperial Institute to examine into its component parts, of whose report we shall offer the following abridgment:—'It was in 1755 that Mr. Bachalier, struck with the speedy alteration of the stones employed in the principal buildings at Paris, and the inconveniencies of the process employed from time to time to renew their surfaces, proposed to the superintendent of the royal buildings to try a preservative stucco. Accordingly three pillars in the court of the Louvre were coated with this stucco for half their length, two facing the south, the other the west. These were still remarkable in July last for the uniformity of their tint, strongly distinguished from the dull gray and earthy aspect of the contiguous parts: but, as the alterations made in completing the Louvre would necessarily destroy every trace of this experiment, the Institute appointed a committee to enquire concerning it before it should be too late. In company with Mr. Fontaine, architect of the Louvre, the gentlemen above-mentioned examined the pillars, and found that the stucco applied formed a coat too thin to injure the finishing of the most delicate sculpture; that it retained a uniform color even in the parts exposed to the action of the wind, rain, and sun; that rubbing it with the hand made no impression on it; and that, if one of the three pillars exhibited a reddish yellow tint, there could be no doubt, from its appearance in other respects, that this was owing to some coloring matter added intentionally. It could not be found on enquiry that Mr. Bachalier had consigned his process to writing, and the following was the best account his son could give of it from memory. 'Its basis consists of the sifted powder of oyster-shells, previously washed and calcined to whiteness, mixed with the butyraceous and caseous part of milk. My father used the common cheese known by the name of *fromage à la pie* (skimmed milk cheese). He first separated all the whey part by pressure, and then left it some time exposed to the air to dissolve or soften. In this state he mixed with it a quantity of calcined oyster-shells in fine powder. When this mixture was brayed on a stone, the cheese softened, and formed a very smooth and whitish liquid paste. To make the stucco he diluted this with a solution of alum in water; the quantity of water being proportioned according to the thickness of the coat intended to be applied.'

'Mr. Bachalier could say nothing of the proportions of the ingredients; he only added that

his father having thought of employing this composition undiluted to cover leaves of paper, from which writing was easily effaced by a wet sponge, he observed that the oyster-shell powder was taken at random, and added to the cheese till it had acquired the consistency of a paste capable of being spread on paper. The committee having obtained from Mr. Bachalier a few leaves of paper covered with thin paste, found, from the very deep black immediately given it by the hydrosulphuret of potash, that it contained a considerable quantity of oxide of lead, the presence of which there was no reason to suspect in the preservative stucco, so that they could not be considered as the same. It remained therefore to analyse the stucco, which was done by Mr. Vauquelin; though, as a very small quantity only could be obtained by scraping the pillars, it did not admit of repeated trials. The results of his analysis gave

Carbonate of lime	63
Sulphate of lime	7.73
Carbonate of lead	6
Oxide of iron, about	4
Silex	2
Water	20
Organic matter, an indeterminate quantity.	

102.73

The surplus of 2.73 Mr. Vauquelin ascribes either to the matter not having been dried to the same degree, or to the escape of a little carbonic acid during the calcination. The presence of animal matter was sought for, but not a particle could be separated. The smell it emitted during calcination no way resembled that of animal matters; on the contrary it had the pungent sharpness of vegetable substances. On being exposed to the action of heat in a retort, however, a clear and almost colorless liquid came over, from which potash expelled a very evident ammoniacal vapor. This indicates that some animal substance entered into the composition, but that in time it was decomposed, and left only an ammoniacal salt. The brownish color it acquired in the fire also proves that some animal matter still remained in it, though altered in its nature, since it neither emitted the smell proper to such substances, nor yielded any perceptible quantity of oil. Lastly, this matter yielded no appreciable quantity of alumine, so that it may be presumed no alum was employed in the composition.

Mr. Bachalier having some of the paper that had been prepared by his father, the coating of this was analysed, and the result indicated that

Quicklime	56.66
Calcined gypsum	23.34
Ceruse or carbonate of lead	20

had entered into its composition.

On these proportions more dependence can be placed than on the former, since it was impossible to detach the plaster from the pillars without some of the substance of the stone itself. That the caseous part of the milk is the proper vehicle for the powders we learn from the positive testimony of Mr. Bachalier, the son; and its utility is confirmed by the experiments of Mr.

D'Arcet published some years ago. Of the efficacy of Mr. Bachalier's composition there can be no doubt, as we have irrefragable and still existing testimony of it; nor would it be difficult to estimate this beforehand, when we consider the causes that produce the gradual decay of the finest buildings in this capital, and the means of guarding against them. Hard and fine grained calcareous stone, susceptible of a greater or less degree of polish, is not liable to this alteration. It is therefore owing to the nature of the stone commonly employed, which is of a loose and unequal texture, filled with cavities, and found by analysis to contain ten or twelve per cent. of silex, and frequently three or four of oxide of iron. The difference of the stones from the quarries near Paris is evident from the tables of Mr. Rondelet, in his Treatise on the Art of Building; where we see, for example, that what is called the grignard of Passy is of the specific gravity of 2.462, and supports a weight of 6750 kil.; while the lambourde of St. Germain has only 1.560 specific gravity and is crushed by a weight of 921 kil. The prices of these two kinds of stone differ too in the proportion of twenty-six to ten.

It is not at all strange that the little spider called by Linnæus *senoculata*, the cellar spider of Geoffroy, should find on the surface of this stone a convenient situation to shelter itself, deposit its eggs, and spread the nets in which it awaits its prey. Its web extends circularly round the cavity that serves as its den, forming round spots of three or four centimes (an inch or an inch and a half) radius. It is not thirty years since the hotel des monnoies was built, and I have counted no fewer than sixty-eight of these dark gray spots on one of the pillars of the vestibule. Similar ones are found not only on the stone, but on the coatings of plaster, and on the walls covered with common stucco. It is particularly in the joints and angles that the insect begins to fix itself. I have seen several on walls, the stucco of which had been coated afresh within less than seven years. These spots at length form a continued coat, retaining the sloughs of these insects, the remains of those on which they feed, and the dust raised by the wind, so that lichens soon take root in them. If it be asked, how is this to be prevented? the answer is easy. By a composition that resists water, will adhere to the stone so as not to scale off, has a sufficient degree of consistency to stop the pores accurately, is liquid enough to be spread as a wash, and uniformly to ice over, as it were, all the saliant and indented parts without thickening the angles or blunting the edges, and lastly which gives to the assemblage of coarse grains the smooth surface of polishable stones, in which it appears these insects cannot nestle. And this we think may be expected from Mr. Bachalier's stucco. Meantime I must observe, that, in the present state of our chemical knowledge, other means of fulfilling these conditions may be pointed out. We know, for instance, that phosphate of lime is one of the most fixed combinations: it would be sufficient, therefore, to wash over the stone with phosphoric acid more or less diluted, or with phosphate of lime, lead, magnesia, &c., held in solution by an

excess of their acid, to give it a sort of covering that would render it as unalterable as the stone of Logozan in Estramadura. It is equally known that sulphate of barytes resists all agents in the humid way; and we might certainly coat the stone with this earthy salt, by first impregnating it with a solution of sulphate of iron, zinc, magnesia, alumine, &c., and immediately washing it over with barytes water. The insolubility of oxalates and tartrates of lime, and the adhesion they contract by deposition even on polished substances, suggest processes for washes not less solid, as the acids added to these salts to render them temporarily soluble, saturating themselves with their base from the substance of the stone itself, would not fail to connect together all the grains, fill up their intervals, and completely close the pores. Trials made with a view to ascertain the justice of this reasoning have confirmed the expectation of a successful result; since on the most porous stones they have produced a surface on which the eye could see no appearance of coating, but which, being rubbed with wet black cloth till the cloth showed signs of wear, was not in the least soiled by it. Preparations of this kind, however, would be much more expensive than Bachalier's stucco, so that their use must be restricted to the preservation of sculpture of extreme delicacy.

For farther satisfaction trials have been made with different kinds of stone, and stucco made in imitation of Bachalier's. These have given rise to the following observations. 1. All the compositions in which alum water was employed soiled the fingers, and were washed off by water. 2. The cheese that acquires the greatest consistency with dry substances is that which is almost entirely deprived of the butyraceous and wheyey parts. M. D'Arcet, in the paper already quoted, had remarked that these were more detrimental than useful, that painting with milk would not resist water, and that the cheese called fromage à la pie might be used after it had grown dry, though less advantageously than when fresh made and well drained. 3. A mixture of this cheese with lime simply forms a paste that adheres but slightly even to coarse grained stone, and not at all to paper. 4. Calcined gypsum, which in a small dose facilitates the union of the lime and cheese, renders the paste hard and clotty if it be used in too large proportion. 5. It had appeared that whitening, which is used in paper hangings, might be admitted into the preparation: but it was found that if this earthy substance, which in a process described by M. D'Arcet is carried to twenty times the weight of the lime, may be used with success for inside work, it would make too thick a coat, and would not adhere so strongly to the stone. 6. The addition of a very little ochre, or red oxide of iron, to this preparation, will give it such a tint as may be wished, without altering its properties. The proportion of cheese must depend in some measure on the state in which it is, and cannot be determined precisely but by the condition of making a soft paste. A fourth of the weight of the solid matters appears to be a sufficient quantity of cheese fresh from the press.

The quantity of lime to be used at once being

determined on, it is to be slaked in as little water as possible, but enough to make it pass through a sieve not very fine, in order to separate the parts that will not slake. This is to be triturated with the cheese to the consistence of a soft, smooth, and coherent paste. To this are to be added the calcined gypsum and the white lead, which must not be adulterated with chalk, and by farther grinding on the stone with a little water the whole is to be reduced to a pap, rather thick than fluid. Lastly, it is to be diluted with common water the moment of using it, which is to be done with a painter's or varnisher's brush.

Dr. Shaw informs us in his *Travels* (p. 286), that the cement or mortar used in Barbary, which is apparently of the same consistence and composition with those of the ancients, is made in the following manner: they take two parts of wood-ashes, three of lime, and one of fine sand, which, after being well sifted and mixed together, they beat for three days and nights incessantly with wooden mallets, sprinkling them alternately and at proper times with a little oil and water, till they become of a due consistence. This composition, he adds, is chiefly used in their arches, cisterns, and terraces; but the pipes of their aqueducts are joined, by beating tow and lime together with oil only, without any mixture of water. Both these compositions quickly assume the hardness of stone, and suffer no water to pervade them: and will, therefore, answer the purpose of: tucco.

STUCK. The *pret.* and *part. pass.* of **STICK**, which see: also, as a noun substantive, a thrust.

I had a pass with rapier, scabbard and all; and he gives me the *stuck* in with such a mortal motion, that it is inevitable. *Shakspeare. Twelfth Night.*

What more infamous brands have records *stuck* upon any, than those who used the best parts for the worst ends? *Deceit of Piety.*

The partners of their crime will learn obedience, When they look up and see their fellow-traitors *Stuck* on a fork, and black'ning in the sun. *Addison.*

STUD, n. s. & v. a. Sax. *studu*; Goth. *stud*. A post or stake; nail or knob: hence a stand for horses; and a collection of horses.—Junius. To furnish with, or adorn with studs.

Thy horses shall be trapped,
Their harness *studded* all with gold and pearl.

Shakspeare.

A belt of straw, and ivy buds,
With coral clasps, and amber studs. *Raleigh.*

Handles were to add,
For which he now was making studs.

Chapman's Iliad.

Crystal and myrrhine cups, embossed with gems
And studs of pearl. *Milton's Paradise Regained.*

In the studs of Ireland, where care is taken, we see horses bred of excellent shape, vigour, and size. *Temple.*

A silver *studded* ax, alike bestowed.
Dryden's Æneid.

STUDDING SAILS, certain light sails extended, in moderate and steady breezes, beyond the skirts of the principal sails, where they appear as wings upon the yard-arms.

STUDLY (John), an English poet, who flourished in the reign of queen Elizabeth. He was educated at Westminster, and afterwards

studied at Trinity College, Cambridge. He translated several of Seneca's tragedies; but was killed at the siege of Breda, where he had a command under prince Maurice, in 1587.

STUDY, *n. s., v. n., &* Fr. *estude*; Latin
 STU'DENT, *n. s.* [*v. a.*] *studium*. Application
 STUD'IED, *adj.* of mind to learning;
 STU'DIER, *n. s.* attention; meditation;
 STU'DIOUS, *adj.* attention; subject of at-
 STU'DIOUSLY, *adv.* tention; apartment
 appropriated to literary employment: to think
 with close application; endeavour: apply the
 mind to: a student and studier signify one
 who closely applies to study: studied and studious,
 given to books; learned; attentive to; care-
 ful (taking of): the adverb corresponding.

Study to be quiet, and do your own business.

I Thess. iv. 11.

Get me a taper in my *study*, Lucius.

Shakspeare. Julius Cæsar.

Keep a gamester from dice, and a good student
 from his book. *Id. Merry Wives of Windsor.*

What can happen

To me above this wretchedness? All your *studies*
 Make me a curse like this? *Id. Henry VIII.*

He hath *studied* her will, and translated her out of
 honesty into English. *Id. Merry Wives.*

He died

As one that had been *studied* in his death,
 To throw away the dearest thing he owed,
 As 'twere a careless trifle. *Shakspeare.*

I'm well *studied* for a liberal thanks
 Which I do owe you. *Id. Antony and Cleopatra.*

You could, for a need, *study* a speech of some
 dozen lines, which I would set down. *Id. Hamlet.*

The king of Castile, a little confused, and in a
study, said, That can I not do with my honour.

Bacon's Henry VII.

It will be fit that some man, reasonably *studied* in
 the law, go as chancellor. *Bacon.*

Studies serve for delight in privateness and retir-
 ing, for ornament in discourse, and for ability in the
 judgment and disposition of business. *Id. Essays.*

Let all *studies* and libraries be towards the east.

Wotton.

Without *study* this art is not attained, nor fit to be
 attained. *Holyday.*

Some servants of the king visited the lodgings of
 the accused members, and sealed up their *studies* and
 trunks. *Clarendon.*

Nothing lovelier can be found

In woman, than to *study* household good. *Milton.*

Just men they seemed, and all their *study* bent
 To worship God aright, and know his works. *Id.*

Let my due feet never fail

To walk the *studious* cloister's pale. *Id.*
 Divines must become *studious* of pious and vene-
 rable antiquity. *White.*

During the whole time of his abode in the univer-
 sity, Hammond generally spent thirteen hours of the
 day in *study*. *Fell.*

STUFF, *n. s., v. a., &* Fr. *estoffe*; Dan.,
 STUFF'ING, *n. s.* [*v. n.*] Belg., and Teut. *stoff*.
 Any matter or body; materials; furniture; es-
 sences; that which fills any thing; a medicine:
 to stuff is to thrust into; to fill to repletion;
 cause to swell out: as a verb neuter, to feed
 gluttonously: stuffing is that by which a thing is
 filled.

Let Phidias have rude and obstinate *stuff* to carve:
 though his art do that it should, his work will lack

that beauty which otherwise in fitter matter it might
 have had. *Hooker.*

She went for parsley to *stuff* a rabbit. *Shakspeare.*
 These gloves the count sent me; they are an ex-
 cellent perfume.

—I am *stuffed*, cousin, I cannot smell. *Id.*
 I will be the man that shall make you great.—I

cannot perceive how, unless you give me your doubt,
 let, and *stuff* me out with straw. *Id. Henry IV.*

Thy verse swells with *stuff* so fine and smooth,
 That thou art even natural in thine art. *Id. Timon.*

Such *stuff* as madmen
 Tongue and brain not. *Shakspeare.*

When we've *stuffed*
 These pipes, and these conveyances of blood,
 With wine and feeding, we have suppler souls. *Id.*

I did compound for her
 A certain *stuff*, which being ta'en would seize
 The present power of life. *Id. Cymbeline.*

Grief fills the room up of my absent child,
 Lies in his bed, walks up and down with me,
Stuffs out his vacant garments with his form.

Put roses into a glass with a narrow mouth, *stuff-*
ing them close together, but without bruising, and
 they retain smell and colour fresh a year.

Bacon's Natural History.
 The workman on his *stuff* his skill doth shew,
 And yet the *stuff* gives not the man his skill. *Davies.*

Each thing beheld did yeeld
 Our admiration: shelves with cheeses heapt;
 Sheds *stuff* with lambs and goats, distinctly kept.

He took away locks, and gave away the king's
stuff. *Chapman.*

It is not usual among the best patterns to *stuff* the
 report of particular lives with matter of public record. *Wotton.*

Groaning waggons loaded high
 With *stuff*. *Cowley's Davideis.*

Those accusations are *stuffed* with odious generals,
 that the proofs seldom make good. *Clarendon.*

Of brick, and of that *stuff*, they cast to build
 A city and tower. *Milton.*

Rome was a farrago out of the neighbouring na-
 tions; and Greece, though one monarchy under
 Alexander, yet the people, that were the *stuffing* and
 materials thereof, existed before. *Hale.*

Degrading prose explains his meaning ill,
 And shews the *stuff*, and not the workman's skill. *Roscommon*

Please not thyself the flattering crowd to hear;
 'Tis fulsome *stuff* to feed thy itching ear. *Dryden's Persius.*

Officious Baucis lays
 Two cushions, *stuffed* with straw, the seat to raise. *Id.*

What have we more to do than to *stuff* our guts
 with these figs? *L'Estrange.*

Pierce an hole near the inner edge, because the
 triangle hath there most substance of *stuff*. *Moxon's Mechanical Exercises.*

Arrach leaves are very good in pottage and *stuf-*
fings. *Mortimer.*

This crook drew hazel-boughs adown,
 And *stuffed* her apron wide with nuts so brown. *Gay.*

For thee I dim these eyes, and *stuff* this head
 With all such reading as was never read. *Pope.*

To-morrow will be time enough
 To hear such mortifying *stuff*. *Swift.*

STUHL-WEISSENBURG, a county of
 West Hungary, between the counties of Vesz-

prim and Pest, from which last it is separated by the Danube. Its territorial extent is 1600 square miles. Except in the north, where it has a few hills, it is in general level and has several lakes and marshes. Besides the Danube, flowing along its eastern boundary, it is watered by the Sarvitz, formed into a canal for a considerable part of its course. The principal products are wheat, wine, and tobacco. Population 120,000.

STUHL-WEISENBURG, or SZEPES-FJARVAR, a town of the south-west of Hungary, the capital of a palatinate, and a bishop's see, was built by king Stephen in the eleventh century, and was, during five centuries, the place where the kings of Hungary were crowned and interred. It was called on that account Alba Regalis; three large moles or causeways proceeded from it; and between these were churches, houses, and gardens, the whole forming extensive suburbs. The removal of the court, and the misfortunes occasioned by repeated sieges, have greatly altered it; though it still contains several respectable buildings. It was formerly traversed by several canals, but these having been neglected are choked up, and the waters have formed marshes. At present it has about 13,000 inhabitants, with a gymnasium and barracks for soldiers; its fortifications were demolished in 1702. The inhabitants are either Catholics, or of the Greek church. Here are some woollen manufactures, and in the neighbourhood a saltpetre work. Thirty-six miles south-west of Buda.

STUKELY (Dr. William), a celebrated antiquarian, descended from an ancient family in Lincolnshire, was born in Holbeach in 1687, and educated in Bennet College, Cambridge. While an under-graduate, he indulged a propensity to drawing; but made physic his principal study, and first began to practise at Boston. In 1717 he removed to London, where, on the recommendation of Dr. Mead, he was soon after elected F. R. S. He was one of the first who revived that of the Antiquarians in 1718, and was their secretary for many years during his residence in town. In 1729 he took holy orders by the encouragement of archbishop Wake; and was soon after presented by lord chancellor King with the living of All Saints in Stamford. In 1741 he became one of the founders of the Egyptian Society, which brought him acquainted with the benevolent duke of Montague, one of the members; who prevailed on him to leave Stamford, and presented him to the living of St. George the Martyr, Queen Square. He died of the palsy, in 1765. His Dissertation on the Spleen was well received; as was also his *Itinerarium Curiosum*, the first fruit of his juvenile excursions. His great learning, and profound researches into the remains of antiquity, enabled him to publish many elaborate and curious works: his friends called him the arch-druid of his age. His discourses, entitled *Palæographia Sacra*, on the vegetable creation, show him a botanist, philosopher, and divine.

STUM, *n. s. & v. a.* Swed. *stum*, supposed to be contracted from Lat. *mustum*. Wine fermented; must; new or newly fermented wine:

to stum is to renew wine by fresh fermentation.

Let our wines without mixture or *stum* be all fine, Or call up the master, and break his dull noddle.

Ben Jonson.

Drink every letter on 't in *stum*, And make it brisk champagne become. *Hudibras*.

An unctuous clammy vapour, that arises from the *stum* of grapes when they lie mashed in the vat, puts out a light when dipped into it. *Addison on Italy*.

Vapid wines are put upon the lees of noble wines to give them spirit, and we *stum* our wines to renew their spirits. *Floyer*.

STUM, in the wine trade, denotes the unfermented juice of the grape after it has been several times racked off and separated from its sediment. The casks are for this purpose well matched or fumigated with brimstone every time, to prevent the liquor from fermenting, as it would otherwise readily do, and become wine. See *MUST*.

STUMBLE, *v. n., v. a., &* This word *JU-STUMBLER, n. s.* [*n. s.*] This word derives from *STUMBLINGBLOCK*, stump, and says *STUMBLINGSTONE*. } the original meaning is to strike, or trip, against a stump. I rather think it comes from tumble.—Johnson. See *TUMBLE*. To trip in walking; slip; err; strike against or upon by chance: to make to boggle: a blunder or failure: the noun substantive and compounds corresponding.

The way of the wicked is as darkness; they know not at what they *stumble*. *Proverbs* iv. 19.

He that loveth his brother abideth in the light, and there is none occasion of *stumbling* in him.

1 John ii. 10.

We preach Christ crucified, unto the Jews a *stumblingblock*, and unto the Greeks foolishness.

1 Corinthians i. 23.

What man art thou, that thus bescreened in night, So *stumblest* on my counsel?

Shakspeare. *Romeo and Juliet*

As we paced along Upon the giddy footing of the hatches, Methought that Gloster *stumbled*; and in falling Struck me, that sought to stay him, overboard.

Shakspeare.

Be sweet to all: is thy complexion sour? Then keep such company, make them thy ally; Get a sharp wife, a servant that will lower:

A *stumbler stumbles* least in rugged way. *Herbert*.

Such terms amused them all, And *stumbled* many. *Milton's Paradise Lost*.

If one illiterate man was *stumbled*, 'twas likely others of his form would be so too. *Fell*.

One *stumble* is enough to deface the character of an honourable life. *L'Estrange*.

One thing more *stumbles* me in the very foundation of this hypothesis. *Locke*.

STUMP, *n. s.* } Swed. and Dan. *stumpe*; } *STUMPY, adj.* } Blg. *stompe*. The part of any solid body remaining after the rest is taken away. See *STUB*. The adjective corresponds.

He struck so strongly, that the knotty sting Of his huge tail he quite in sunder cleft; Five joints thereof he hewed, and but the stump him left. *Spenser*.

Your colt's tooth is not cast yet.—Not while I have a *stump*. *Shakspeare*.

He through the bushes scrambles;

A *stump* doth trip him in his pace,

Down comes poor Hob upon his face

Amongst the briers and brambles.

Drayton.

Y

Who, 'cause they 're wasted to the stumps,
Are represented best by rumps. *Hudibras.*
Against a *stump* his tusks the monster grinds,
And in the sharpened edge new vigour finds.

Dryden.
A poor ass, now wore out to the stumps, fell down
under his load. *L' Estrange.*

A tongue might have some resemblance to the
stump of a feather. *Grew's Musæum.*

They burn the stubble, which, being so *stumpy*,
they seldom plow in. *Mortimer.*

A coach-horse snap off the end of his finger, and
I dressed the *stump* with common digestive.

Wiseman's Surgery.
Worn to the *stump* in the service of the maids, 'tis
thrown out of doors, or condemned to kindle a fire.
Swift.

STUN, v. a. Sax. *ŕtunan*, of *ŕertun*, noise,
Fr. *etonner*. To confound or dizzy with noise;
or with a blow.

An universal hubbub wild
Of *stunning* sounds, and voices all confused,
Assaults his ear. *Milton.*

Still shall I hear, and never quit the score,
Stunned with hoarse Codrus' Theseid o'er and o'er.
Dryden.

One hung a pole-ax at his saddle-bow,
And one a heavy mace to *stun* the foe. *Id.*

Too strong a noise *stuns* the ear, and one too
weak does not act upon the organ. *Cheyne.*

The Britons, once a savage kind,
Descendants of the barbarous Huns,
With limbs robust, and voice that *stuns*,
You taught to modulate their tongues,
And speak without the help of lungs. *Swift.*

STUNG. The *pret.* and *part. pass.* of sting.

To both these sisters have I sworn my love:
Each jealous of the other, as the *stung*
Are of the adder. *Shakspeare. King Lear.*

With envy *stung*, they view each other's deeds;
The fragrant work with diligence proceeds.
Dryden's Æneid.

STUNT, v. a. Isl. *stunta*. To hinder from
growth.

Though this usage *stunted* the girl in her growth,
it gave her a hardy constitution; she had life and
spirit. *Arbuthnot.*

The tree
Grew scrubby, dried a-top, and *stunted*;
And the next parson stubbed and burnt it. *Swift.*

STUPE, n. s. Lat. *stupa*. Cloth or flax
dipped in warm medicaments, and applied to a
hurt or sore.

A fomentation was by some pretender to surgery
applied with coarse woollen *stupes*, one of which was
bound upon his leg. *Wiseman's Surgery.*

STUPEFACTION, n. s. } Fr. *stupefaction*;
STUPEFACTIVE, adj. } Lat. *stupefactus*;
Insensibility; dulness; stupidity; sluggishness
of mind: causing such a state of mind; narcotic.

It is a gentle fomentation, and hath a very little
mixture of some *stupefactive*.

Bacon's Natural History.
All resistance of the dictates of conscience brings
a hardness and *stupefaction* upon it. *South.*

She sent to every child
From impudence, or *stupefaction* mild;
And straight succeeded, leaving shame no room,
Cibberian forehead, or Cimmerian gloom. *Pope.*

STUPENDOUS, adj. Lat. *stupendus*. Won-
derful; amazing; astonishing.

All those *stupendous* acts deservedly are the sub-
ject of a history excellently written in Latin by a
learned prelate. *Clarendon.*

Great joy was at their meeting, and at sight
Of that *stupendous* bridge his joy increased. *Milton.*
Portents and prodigies their souls amazed;
But most when this *stupendous* pile was raised.
Dryden.

Mortals, fly this cursed detested race;
A hundred of the same *stupendous* size,
A hundred Cyclops, live among the hills.

Addison.
STU'PID, adj. } Fr. *stupid*; Lat. *stupidus*.
STU'PIDITY, n. s. } Dull; wanting sensibility
STU'PIDLY, adv. } or apprehension; heavy;
sluggish of understanding: the noun substantive
and adjective corresponding.

That space the evil one abstracted stood
From his own evil, and for the time remained
Stupidly good. *Milton's Paradise Lost.*

O that men should be so *stupid* grown
As to forsake the living God! *Milton.*
Men, boys, and women, *stupid* with surprise,
Where'er she passes fix their wond'ring eyes.
Dryden.

Shadwel alone, of all my sons, is he
Who stands confirmed in full *stupidity*. *Id.*
On the shield there were engraven maps of coun-
tries, which Ajax could not comprehend, but looked
on as *stupidly* as his fellow-beast the lion. *Id.*

With wild surprise
A moment *stupid*, motionless, he stood. *Thomson.*

STUPIDITY. The Greek word *μωροτης* cor-
responds most with our English word stupidity
or foolishness, when used to express that state
of mind in which the intellects are defective.
The immediate causes are said to be, a deficiency
of vital heat, or a defect in the brain. Stupid
children sometimes become sprightly youths;
but, if stupidity continues to the age of puberty,
it is hardly ever removed. If stupidity follows
upon a violent passion, an injury done to the
head, or other evident cause, and if it continues
long, it becomes incurable. But the stupidity
which consists in a loss of memory, and succeeds
a lethargy spontaneously, ceases when the lethargy
is cured.

STU'PIFY, v. a. Lat. *stupefacio*. To make
stupid; deprive of sensibility; to dull.

Those
Will *stupify* and dull the sense a while.
Shakspeare. Cymbeline.

It is not malleable; but yet is not fluent, but *stu-
pified*. *Bacon.*

Pounce it into the quicksilver, and so proceed to
the *stupifying*. *Id.*

Consider whether that method, used to quiet some
consciences, does not *stupefy* more. *Decay of Piety.*

Envy, like a cold poison, benumbs and *stupefies*;
and, conscious of its own impotence, folds its arms
in despair. *Collier.*

STU'POR, n. s. Fr. *stupeur*; Lat. *stupor*.
Suspension or diminution of sensibility.

A pungent pain in the region of the kidneys, a
stupor or dull pain in the thigh, and colick, are
symptoms of an inflammation of the kidneys.
Arbuthnot on Diet.

STUPRATION, n. s. Lat. *stupratio*, from
stupro. Rape; violation.

Stupration must not be drawn into practice.
L'rownc.

STURBRIDGE, a post-town of Worcester county, Massachusetts, eighteen miles south-west of Worcester, and fifty-eight south-west of Boston. It is watered by the Quinebaug, and the turnpike from Worcester to Hartford passes through the town.

STURDY, *adj.* Fr. *estourdi*. Hardy; stout; brutal; stiff; obstinate. It is always used with some disagreeable idea of coarseness or rudeness.

The ill-apparell'd knight now had gotten the reputation of some *sturdy* lout, he had so well defended himself. *Sidney.*

Then withdraw

From Cambridge, thy old nurse; and, as the rest,
Here toughly chew and *sturdily* digest
'The' immense vast volumes of our common law.

Donne.

He was not of any delicate contexture, his limbs rather *sturdy* than dainty. *Wotton.*

Sturdiest oaks

Bowed their stiff necks, loaden with stormy blasts,
Or torn up sheer. *Milton's Paradise Regained.*

This must be done, and I would fain see
Mortal so *sturdy* as to gainsay. *Hudibras.*

Awed by that house, accustomed to command,
The *sturdy* kerns in due subjection stand,
Nor bear the reins in any foreign hand. *Dryden.*

A *sturdy* hardened sinner shall advance to the utmost pitch of impiety with less reluctance than he took the first steps, whilst his conscience was yet vigilant and tender. *Atterbury.*

STURDY, a disease in sheep of much importance. There are two varieties of it, stated by Dr. Duncan, jun., in his useful paper on it, in the third volume of the Transactions of the Highland Society of Scotland; the appearances in each of which are as follow:—When a sheep is attacked with the first of these varieties of the sturdy, it ceases, it is said, to improve, becomes dull, is apt to loiter behind, and separates from the flock. It does not walk straight forward, but often deflects on one side, or dozes round in a circle. The eyes glare steadily in its head, and seem enlarged, from the pupil being round instead of oval, which in healthy sheep is always the case in the day time. Its vision is impaired, and it does not see any object which approaches until it be very near, when it starts away, and runs furiously without any aim. When caught, it is remarkably stupid on being again liberated. In dry weather, it follows eagerly to that quarter from which the wind blows. It has a great reluctance at passing water, as burns or brooks, and cannot easily get through them, but mostly frequents places where it can hear the sound of water. Some time after these appearances have presented themselves, in the course of perhaps about three weeks, there appears and is found, on examining the head, by pressing on it with the thumbs, a remarkable degree of softness at one part of it, where the skull seems to be wanting. But in a few instances no softness is to be discovered in any period of the disease, but in either case, if not relieved by a proper operation, the animal loses the power of standing, and dies perfectly emaciated. The continuance of this sort or variety of the disease extends or lasts from two months to a year, as the circumstances of the particular case may be. The second or

latter of these varieties is, however, much more rapid in its progress, in which, in addition to some of the above appearances, a great degree of stupor comes on in a few days, which is followed by total blindness, and no softness is ever to be found in any part of the skull or bones of the head.

The appearances on opening the head, in the first of the above varieties, are an oval or round bag, which is found lying between the brain and the skull, quite unconnected with any of the surrounding parts, generally situated between or beneath the horns. These bags vary much in size, being sometimes no larger than a plum, while at others they are as big as a goose's egg. They are filled with a clear fluid like water, sometimes intermixed with a thin crust, when it is of a glutinous or slimy nature. Within, or in the skins of these bags, are seen, according to some, many little white bodies, nits, or the ova of insects. These are thus described by Mr. W. Hog, which, though in some measure hypothetical, display an accuracy of observation. He is induced to believe, from two or three recent cases and observations, that the dissolution of the brain, &c., is occasioned by numbers of animalculæ, which have been noticed to be swimming loosely in the liquor. They resemble ants' eggs, both in shape and color, but are somewhat shorter. However, as all the animals upon which he made the observation had been dead for some time, so these puny inhabitants of the brain were also dead; but if they had been living and organised animals, which he has no doubt they were, there would be multitudes of so diminutive a size, as to be quite imperceptible to the naked eye; and he is fully convinced that if the disease was minutely observed in all its stages by microscopical examination, whatever its beginning was, its progress would be, by the activity of these animalculæ, increasing both in number and size. In proportion as the disease advances, the bag increases in size, and by its pressure causes the brain to decrease, while the skull immediately over the bag becomes soft and disappears, so that nothing intervenes between it and the integuments of the head. Sometimes, but only in those cases where no attempt has been made to cure or remove it, there are many small bags, unconnected with each other, distributed through the brain or cerebral parts.

In the second sort or variety of the disease, the water is not contained in a bag, but within the substance of the brain, in certain cavities termed its ventricles, and sometimes in the hinder parts, where it joins with the spinal marrow, in which case it is thought to be quite incurable. Hard substances or excrescences growing out from the inside of the skull, and blows upon the head, occasionally produce all the appearances of real sturdy; but in these cases no water is to be found in the parts. The cause of the appearances in this disease is therefore unquestionably pressure on the brain, whether it arise from accidental contusion; from a bony excrescence, as in false sturdy; or from a collection of water, as in the legitimate varieties of it, as seen above. What, however, gives rise to these collections of water, is not by any means

so well ascertained. Inflammation of the brain probably precedes its effusion in the latter variety of the disease; but the generation of the hydatids, or water-bags, in the former sort or variety, is not at all understood. The disease is not contagious; neither is it peculiar to any soil. It generally affects sheep of the hog kind in the beginning months of the spring and summer, and is commonly ascribed to exposure to tempestuous weather, without sufficient shelter.

In regard to the cure of the disease, as the natural termination of it is invariably fatal, unless those rare recoveries which are sometimes the consequence of accidental blows on the head, that probably rupture the bags, be excepted; and more especially as the mutton in this disease is good, the sooner an attempt is made to relieve the animal by the proper operation, the better; for want of which relief, although it is extremely simple, and not unfrequently successful, thousands of sheep are suffered to perish through carelessness or ignorance. The cure in these cases may be attempted in three different ways, as by tapping, trepanning, and wiring. Where the bag is seated any where in the crown of the head, some suppose that the most ready and the gentlest method is to tap it in the place where the skull is soft, and to let the water run out. This is most commonly performed by means of an awl, or large corking pin, though an instrument with a small tube in it, termed a trocar in surgery, might be easily contrived and formed, which would drain it off in a more complete manner. By this operation, if the instrument be not pushed too far, the animal is nothing the worse, it is said, whether it recover or not. But, what is very remarkable, this plan is not, it is said, successful on all farms alike, of which many instances are known. An old shepherd has often been heard to remark that, in the course of thirty years' experience, not one sheep out of twenty which he had tapped on his own farm had died, while it was very rare that he could cure any on some of the neighbouring ones. He constantly performs it with a corking pin. Others assert that, in their neighbourhoods, more sheep have been cured by this operation than by any other, in performing which the sheep is advised to be laid on its back, and the pin to be inserted in an oblique manner; if water follow, the cure is said to be certain; but, even though it should not follow, provided the bag be pricked into, it is often successful in removing the disease. In the mode of cure by means of trepanning and extracting the bag or cyst, the description of which is accurately given below, there are several circumstances to be carefully attended to.

The animal being properly secured, and the head placed in the most convenient position, the part to be cut being uppermost, the skin is to be divided by an incision an inch and a half in length, crossed by another of the same length at right angles to it. The skull, which is quite soft, is then to be cautiously divided in the same manner, until the bag with the fluid in it appear clear at the bottom of the incision, which it commonly does. The soft skull is now to be turned back, or a bit cut out of it, so as to

render the bag completely evident. It should then be taken hold of by a pair of blunt forceps, and be gently moved backwards and forwards, to loosen it from its connexions, which are generally very slender. This may also be done by means of a crow's quill, or any blunt pointed instrument, carried frequently round it. The nose of the animal is now to be held, so as to restrain its breath, which may force the bag from its situation. The operator is to continue moving and pulling it, stopping the breathing of the sheep at intervals, until it is quite extracted. The skin after this is to be laid neatly down again, and a cloth spread with tar placed and tied over the wound above the dry lint, which is folded and laid on it, to prevent either cold in the spring, or flies in the summer, from injuring it. This is to be allowed to remain for two days, when the dressings may be changed, and a bit of cloth spread with hog's lard, fresh butter, tar, or some other ointment, applied on the wound. The dressings should be changed every second day for ten days or a fortnight, after which time, in ordinary cases, it will require no more attention, being generally healed up. The skull grows over it in about a month, and then becomes of its usual hardness; and the animal is equally healthy, as if no disease had previously existed. It is said that the senses return after the operation in a few hours, and that the next day the sheep seems to be quite relieved.

When, in consequence of rashness or inattention, the bag containing the fluid has been ruptured, which sometimes happens, it is very difficult, and in many cases impossible, to extract the sac. The best practice, in this situation of things, is, it is said, to place the animal in such a position as that all the fluid may run out and be discharged; washing the wound with spirits, and trying to extract, if possible, the remains of the sac, then dressing it with a mixture of tar and basilicon, or either separately, then turn the animal, which has now lost its stupid appearance, into a good pasture. The damps and cold of nights should be avoided, as they tend to produce inflammation, which very soon destroys the animal. In this case, the admission of the external air, and the irritating dressings, cause the sides of the sac to adhere: this, however, is not always the case, it is said, as after a week or two the appearances of the disease have been known to return, after the alleviation which the operation constantly produced. When this happens, it is almost impossible to extract the bladder or bag entire, on account of the inflammation, from the cutting, causing strong adhesion. In this case the bag may be opened, and a little spirits of port wine injected by means of a syringe, which has been known, in more than one case, to prevent a return of the symptoms. This operation should not, where possible, be performed in hot or very warm weather, as maggots are extremely apt to breed in the wound. In frost, too, inflammation is liable to be produced, which may also at that time render it improper. In these cases, the sheep should be fattened for the butcher as soon as possible.

The operation of wiring is described in this manner by Mr. Hog. In case the skull should feel soft in the forehead, then the operation must be performed by thrusting a stiff sharpened wire up each nostril, until it stop against the upper part of the skull. If this mode of cure were not well authenticated, by daily experience and observation, it might, it is said, appear a very severe and dangerous operation or practice, as the wire goes quite through the brain in two different places; yet a far greater number of sheep are cured in this way than by any other. The above person has cured many both ways, he says, and killed a part too; but those which he killed were generally with the wire, because, if the other fail of producing the desired effect, the wire is constantly applied to as a last resource; and many have been seen cured by it which were apparently past all means of recovery. By some of these means, properly made use of, this disease will be found to be mostly capable of being removed.

STURGEON, *n. s.* Lat. *sturio*, *tursio*. A sea-fish.

It is part of the scutellated bone of a *sturgeon*, being flat, of a porous or cellular constitution on one side, the cells being worn down and smooth on the other.

Woodward.

STURGEON, STURIO. See ACCIPENSER. The sturgeon is supposed to be the *ὐγκος* of Dorion, as quoted by Athenæus, who says, its mouth is always open, and that it conceals itself in the hot months. Hence it must be of a cold nature; which is confirmed by the description given of the European species, by Mr. Forster, in his Essay on the Volga. He says, they are scarcely ever found in that river in spring or summer, but abound in vast numbers in autumn and winter, when they crowd up the river, from the sea, and are taken in great numbers. The ancients were also acquainted with the *huso*, another species, which affords ichthyocola, or isinglass.

STURMIUS (James), a learned German, born at Strasburg in 1489. He rendered the most important services to his country, by contributing greatly to the reformation of religion at Strasburg; to the erection of a college there, and to his friend Sleidan's History of the Reformation in Germany. See SLEIDAN. He also served his country essentially as an ambassador to different foreign courts, and as a deputy to the diets of the empire. This learned reformer died at Strasburg, October 30th, 1553.

STURMIUS (John), a learned philologer and rhetorician, born at Sleidan near Cologne in 1507; in the same town, and within a year of the celebrated J. Sleidan, along with whom he was educated. He afterwards studied with the sons of count de Manderscheid, whose receiver his father was: and next at Liege in the college of St. Jerome, and then went to Louvain in 1524; where he spent five years, three in learning and two in teaching. He set up a printing press with Rudger Rescius, professor of the Greek tongue, and printed several Greek authors. He went to Paris in 1529, where he was highly esteemed, and read public lectures on the Greek and Latin writers, and on logic. He married,

and kept a great number of boarders; but, as he inclined to the new opinions, he was more than once in danger; and therefore he removed to Strasburg in 1537, to a place offered him by the magistrates. In 1538 he opened a school, which became famous, and was by Maximilian II. made a university in 1566. He was well skilled in literature, wrote Latin with great purity, and was a good teacher. He was often entrusted with deputations in Germany and foreign countries, and discharged these employments with great honor. He showed extreme charity to the refugees on account of religion: he not only assisted them by his advice and recommendations, but he even impoverished himself for them. He died in 1589, in his eighty-second year, after he had been for some time blind. He published many books; the principal of which are, 1. *Partitiones Dialecticæ*; 2. *De Educatione Principum*; 3. *De Nobilitate Anglicana*; 4. *Lingua Latinæ Resolvendæ Ratio*; 5. *Excellent Notes on Aristotle's and Hermogenes's Rhetoric*, &c.

STURMIUS (John), a native of Mechlin, and physician and professor of mathematics at Louvain, also wrote several learned works.

STURMIUS (John Christopher), another learned German, born at Hippolstein, in 1635. He became professor of philosophy and mathematics at Altdorf. He published a translation of Archimedes into German; A Complete Course of Mathematics; and several Philosophical Treatises. He died at Altdorf, in 1703.

STURNUS, the starling, a genus of birds belonging to the order of passeres. The beak is subulated, depressed, and somewhat blunt; the superior mandible is entire, and somewhat open at the edges; the nostrils are margined above; and the tongue is sharp and emarginated. There are fifteen species according to Dr. Latham; viz. 1. *S. Capensis*; 2. *carunculatus*; 3. *cellaris*; 4. *dauricus*; 5. *gallinaceus*; 6. *juncti*; 7. *loyca*; 8. *ludovicianus*; 9. *Mexicanus*; 10. *militaris*; 11. *moritanicus*; 12. *olivaceus*; 13. *sericeus*; 14. *viridis*; and,

15. *S. vulgaris*, the common starling, or stare, the only species that is indigenous. The weight of the male is about three ounces, that of the female rather less; the length of the male is about eight inches and three-quarters: the bill is brown or yellow, but in old birds generally yellow. The whole plumage is black, very resplendent, with changeable blue, purple, and copper: each feather marked with a pale yellow spot. The lesser coverts are edged with yellow, and slightly glossed with green. The quill feathers and tail dusky; the former edged with yellow on the exterior side; the last with dirty white. The legs of a reddish brown. They breed in hollow trees, eaves of houses, towers, ruins, cliffs, and often in high rocks over the sea, such as that of the Isle of Wight. The female lays four or five eggs, of a pale greenish ashy-color; and makes its nest of straw, small fibres of roots, and the like. In winter, stares assemble in vast flocks; they collect in myriads in the fens of Lincolnshire, and do great damage to the fen-men, by roosting on the reeds, and breaking them down by their weight; for reeds are the thatch of the country, and are laid up in harvest

with great care. These birds feed on worms and insects; and they will get into pigeon-houses for the sake of the eggs. Their flesh is so bitter as to be scarcely eatable. They follow oxen and other large cattle in the meadows, attracted by the insects which flutter round them. They live seven or eight years, or even longer, in the domestic state. The wild ones cannot be decoyed by the call, because they regard not the scream of the owl. A method has been discovered of taking entire families, by fixing to the walls and the trees where they lodge pots of earthenware of a convenient form, which the birds often prefer to place their nests in. Many are also caught by the gin and draw-net. In some parts of Italy it is common to employ tame weasels to drag them out of their nests. The stare can be taught to speak French, German, Latin, Greek, &c., and to pronounce phrases of some length. Its pliant throat accommodates itself to every inflection and every accent. It can readily articulate the letter R, and acquires a sort of warbling which is much superior to its native song. These birds are spread through an extensive range in the ancient continent. They are found in Sweden, Germany, France, Italy, the Isle of Malta, the Cape of Good Hope, and are every where nearly the same; whereas those American birds which have been called stares present a great diversity of appearance.

STUT, or STUTTER, *v. n.* } Teut. and
STUTTER, or STUTTERER, *n. s.* } Belg. *stotteren*. To speak with hesitation; stammer: one who stammers in his speech.

Divers *stut*: the cause is the refrigeration of the tongue, whereby it is less apt to move; and therefore naturals *stut*. *Bacon.*

Many *stutters* are very choleric, cholera inducing a dryness in the tongue. *Id. Natural History.*

STUTTGARD, the capital of the kingdom of Wirtemberg, stands on the river Nisselbach, in a valley, and is only two miles from the Neckar, over which there is a fine bridge. It is divided into four parts, the Town Proper, two suburbs adjacent to each other, and the separate suburb called Esslingen. The Town Proper is badly built, the streets being narrow, and the houses of wood. The suburbs, being less antique, are somewhat better, particularly that of Esslingen, in which are the royal palace, gymnasium, barracks, &c. The palace is a noble structure, and has an extensive park: its interior contains a good collection of paintings and statues; around are several public establishments, a spacious opera house, a theatre, museum, garden, and an academy for painting, sculpture, and architecture. The royal library is said to contain 100,000 volumes, among which is a unique collection of bibles. The gymnasium has an observatory, and a good collection of mathematical instruments. The town has also a public library; and though it can boast of no handsome streets, except King Street, adjoining the palace, it has several pleasant walks. Its public buildings are an old palace, now used for government offices, a mint, town-house, great church, and the royal stables. Stuttgart is surrounded by a wall and ditch, but is a place of

no strength; and though repeatedly entered by the armies on both sides, between the years 1796 and 1815, it escaped those calamities which pressed so severely on it in the wars of the sixteenth and seventeenth centuries. The manufactures are on a small scale; and consist of leather, hats, cotton, silk, plated goods, and snuff. The expenditure of the court and nobility forms the chief support of the town. Provisions are abundant and reasonable, the surrounding country being equally fertile and beautiful. Thirty-seven miles E. S. E. of Carlsruhe, and 116 W. N. W. of Munich.

STY, *n. s. & v. a.* Sax. *stige*; Swed. *stia*. A cabin to keep hogs in; any place of filthy character: to shut up in a sty.

Tell Richmond,
That in the *sty* of this most bloody boar
My son George Stanley is franked up in hold.
Shakspeare. Richard III.

Here you *sty* me
In this hard rock, while you do keep from me
The rest of the island. *Id. Tempest.*

They all their friends and native home forget,
To roll with pleasure in a sensual *sty*. *Milton.*

With what ease
Mightest thou expel this monster from his throne,
Now made a *sty*. *Id. Paradise Regained.*

May thy black pigs lie warm in little *sty*,
And have no thought to grieve them till they die!
King.

When her hogs had missed their way,
Th' untoward creatures to the *sty* I drove,
And whistled all the way. *Gay.*

STYGIAN, *adj.* Lat. *stygius*. Hellish; infernal; pertaining to Styx, one of the poetical rivers of hell.

At that so sudden blaze the *Stygian* throng
Bent their aspect. *Milton.*

STYGIAN LAKE, or RIVER. See STYX.

STYLE, *n. s. & v. a.* Lat. *stylus*. Manner of writing with regard to language; mode of speech; mode of painting; title; appellation; a graver: the stalk of a flower, see below: to style is, to term; call.

No *style* is held for base, where love well named
is. *Sidney.*

Happy
That can translate the stubbornness of fortune
Into so quiet and so sweet a *style*. *Shakspeare.*

Ford's a knave, and I will aggravate his *stile*;
thou shalt know him for knave and cuckold. *Id.*

The king gave them in his commission the *style*
and appellation which belonged to them.
Clarendon.

Fortune's gifts, my actions
May *stile* their own rewards. *Denham's Sophy.*

Placing two *stiles* or needles of the same steel,
touched with the same loadstone, when the one is
removed but half a span, the other would stand like
Hercules's pillars. *Browne.*

Their beauty I will rather leave to poets than
venture upon so tender and nice a subject with my
severer *style*. *More.*

O virgin! or what other name you bear
Above that *style*, O more than mortal fair!
Let not an humble suppliant sue in vain.

Dryden's Æneid
While his thoughts the lingering day beguile,
To gentle Arcite let us turn our *style*. *Dryden.*

Whoever backs his tenets with authorities, thinks

He ought to carry the cause, and is ready to *stile* it impudence in any one who shall stand out. *Locke.*

Style is the middle prominent part of the flower of a plant, which adheres to the fruit or seed: 'tis usually slender and long, whence it has its name.

Quincy.

Let some lord but own the happy lines,
How the wit brightens, how the *style* refines! *Pope.*

Propitious hear our prayer,

Whether the *style* of Titan please thee more,
Whose purple rays the Achæmenes adore.

Id. Statius.

Proper words in proper places make the true definition of a *style*.

Swift.

The great *stile* stands alone, and does not require, perhaps does not as well admit, any addition from inferior beauties. The ornamental *style* also possesses its own peculiar merit: however, though the union of the two may make a sort of composite *stile*, yet that *stile* is likely to be more imperfect than either of those which go to its composition.

Reynolds.

STYLE is a word of various significations, originally deduced from *stylos*, a kind of bodkin wherewith the ancients wrote on plates of lead, or on wax, &c., and which is still used to write on ivory leaves, and paper prepared for that purpose, &c.

STYLE, in language, is the peculiar manner in which a man expresses his conceptions. It is a picture of the ideas which rise in his mind, and of the order in which they are there produced. The qualities of a good style may be ranked under two heads; perspicuity and ornament. Perspicuity ought to be essentially connected with every kind of writing; and, to attain it, attention must be paid, first to single words and phrases, and then to the construction of sentences. With respect to words and phrases, it requires these three qualities; purity, propriety, and precision. With regard to sentences, it requires a clear arrangement of the words and unity in the sense; to which, if strength and harmony be added, the style will become ornamented. One of the most important directions to be observed, by him who wishes to form a good style, is to acquire clear and precise ideas on the subject concerning which he is to write or speak. To this must be added frequency of composition, and an acquaintance with the style of the best authors. A servile imitation, however, of any author is carefully to be avoided; for he who copies can hardly avoid copying faults as well as beauties. A style cannot be proper unless it be adapted to the subject, and likewise to the capacity of our hearers, if we are to speak in public. A simple, clear, and unadorned style, such as that of Swift, is fittest for intricate disquisition; a style elegant as Addison's, or impetuous like Johnson's, is most proper for fixing the attention on truths, which, though known, are much neglected. We must not be inattentive to the ornaments of style, if we wish that our labors should be read and admired: but he is a contemptible writer who looks not beyond the dress of language, who lays not the chief stress upon his matter, and who does not regard ornament as a secondary and inferior recommendation. For further observations on the different kinds of style, see **LANGUAGE, ORATORY, and SIMPLICITY.** The

earl of Buchan in his *Life of Fletcher*, while he celebrates the style of that great patriot, pays no compliment to the orators of the present age: 'Fletcher' says his lordship, 'was by far the most nervous and correct speaker in the parliament of Scotland; for he drew his style from the pure models of antiquity, and not from the grosser practical oratory of his contemporaries; so that his speeches and his language will bear a comparison with the best speeches of the reign of queen Anne, the Augustan age of Great Britain, far superior to the meretricious, inflated, metaphorical style of our modern orators.'

STYLE, in botany. See **BOTANY**, Index.

STYLE, in dialing, denotes the gnomon or cock of a dial raised on the plane thereof to project a shadow.

STYLE, in jurisprudence, the particular form or manner of proceeding in each court of jurisdiction, agreeable to the rules and orders established therein: thus we say the style of the court of Rome, of chancery, of parliament, of the privy-council, &c.

STYLE, in music, denotes a peculiar manner of singing, playing, or composing; being properly the manner that each person has of playing, singing, or teaching; which is very different, both in respect of different geniuses, of countries, nations, and of the different matters, places, times, subjects, passions, expressions, &c. Thus we say, the style of Palestrina, of Lully, of Corelli, of Handel, &c.; the style of the Italians, French, Spaniards, &c.

STYLE, **NEW**, in chronology, the Gregorian method of computation.

STYLE, **OLD**, the Julian method of computing time.

STYLEPHORUS CHORDATUS, a genus of fishes belonging to the order of apodes. This very curious genus was discovered by Dr. Shaw, who read a description of it before the Linnæan Society in 1788. The eyes are fixed on cylindrical pillars which lie close together. The rostrum, or narrow part which is terminated by the mouth, is connected to the back part of the head by a flexible leathery duplicature, which permits it either to be extended in such a manner that the mouth points directly upwards, or to fall back so as to be received into a sort of case, formed by the upper part of the head. There are three pairs of branchiæ situate under the throat. The pectoral fins are small; the dorsal fin runs from the head to within about an inch and a half of the tail; the caudal fin is short, and is furnished with five remarkable spines. The body is extremely long, and compressed very much, and gradually diminishes as it approaches the tail, which terminates in a process or string of an enormous length, and finishes in a very fine point. This string, or caudal process, seems to be strengthened throughout its whole length, or at least as far as the eye can trace it, by a sort of double fibre or internal part. The stylephorus chordatus is a native of the West Indian Sea. It was taken between the islands of Cuba and Martinico, near a small cluster of little islands about nine leagues from shore, and was seen swimming near the surface. The whole length of this uncommon animal, from the head to the

extremity of the caudal process, is about thirty-two inches, of which the process itself measures twenty-two.

STYLET, a small dangerous kind of poniard, which may be concealed in the hand, chiefly used in treacherous assassinations. The blade is usually triangular, and so small that the wound it makes is almost imperceptible. See STILETTO.

STYLITES, or STILITES, pillar saints, a kind of solitaries, who stood motionless upon the tops of pillars. They were totally suppressed in the twelfth century. The tops of these columns were only three feet in diameter, and were defended by a rail, that reached almost to the girdle, somewhat resembling a pulpit. There was no lying down in it. The faquirs, or devout people of the east, imitate this extraordinary and most absurd kind of life to this day.

STYLOCERALOIDES, STYLOGLOSSUS, STYLOHYOIDEUS, STYLOIDES, STYLOPHARYNGEUS, the names of different muscles in the human body. See ANATOMY.

STYLOSANTHES, in botany, a genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the thirty-second order, papilionaceæ. The calyx is tubulated, very long, having the corolla attached to it. The legumen or pod biarticulated and hooked. Of these there are two species, both natives of Jamaica, viz. 1. *S. procumbens*, the hedsysarum procumbens of Linnæus: a figure of which may be seen in Sloane's Natural History of Jamaica.

2. *S. viscosa*, the trifolium of Browne; a figure of which is also given by Sloane.

STYPTERIA, a name given by the Greeks to a species of ALUM. Under the article alum which the ingenious Dr. Thomson ranks as the thirteenth of the sulphates, in his System of Chemistry, vol. ii. p. 272, he has the following remarks on this substance: 'The *στυπτηρια* of the Greeks, and the alumen of the Romans, was a native substance, which appears to have been nearly related to green vitriol, or sulphate of iron; and which consequently was very different from what we at present denominate alum.' 'From the researches of professor Beckman, it appears that we owe the discovery of alum to the Asiatics; but at what period, or by what means the discovery was made is unknown.' 'The composition of alum has been but lately understood with accuracy. It has been long known that one of its ingredients is sulphuric acid; and the experiments of Geoffroy, Hellot, Pott, Margraff, and Macquier, prove incontestibly that alumina is another. But sulphuric acid and alumina are incapable of forming alum. Manufacturers knew that the addition of a quantity of potass, or of ammonia, or of some substance containing these alkalies, is almost always necessary; and it was proved that, in every case in which such additions are unnecessary, the earth from which the alum is obtained, contained already a quantity of potass. Various conjectures were made about the part which potass acts in this case; but Chaptal and Vauquelin appear to have been the first chemists who ascertained, by decisive experiments, that alum is a triple salt, composed of sulphuric acid, alumina, and potass, or ammonia, united together.

'As alum contains an excess of acid, it belongs to the class of super-sulphates.' See SUPERSULPHATE.

STYPTIC, *adj.* } Fr. *styptique*; Gr. *στυπτικος*. Often, though erroneously, written stiptick
STYPTICAL, }
STYPTICITY, *n. s.* } The same as astringent; but generally expressing the most efficacious sort of astringents: the power of staunching blood.

There is a poor sour *stiptick* salt diffused through the earth, which, passing a concoction in plants, becomes milder.

In an effusion of blood, having dossil ready dipt in the royal *stiptick*, we applied them.

Wiseman's Surgery.
Catharticks of mercurials precipitate the viscidities by their *stypticity*, and mix with all animal acids.

Floyer.
Fruits of trees and shrubs contain phlegm, oil, and an essential salt, by which they are sharp, sweet, sour, or *styptic*. *Arbutnot* on *Aliments*.

STYPTICS, in pharmacy, medicines which, by their astringency, stop hæmorrhages, &c. See MATERIA MEDICA.

STYRAX, the storax tree, in botany, a genus of plants belonging to the class of decandria, and to the order of monogynia; and in the natural system ranging under the eighteenth order, bicornes. There are four species, viz. 1. *S. benzoinum* is described by Dr. Dryander in the Philosophical Transactions for 1787, p. 308, &c. It has been characterised by oblong acuminate leaves, which are downy underneath, and nearly of the length of the racemi. The botanical character of this tree was mistaken by modern botanists, till Dr. Dryander ascertained it to be a styrax. Benzoin was long supposed to be the produce of a species of laurus. Linnæus detected this error: but he committed another; for he tells us that it is furnished by a shrub which, in the country where it grows, is called croton bezoe; and afterwards, in his Supplementum Plantarum, describes the same plant a second time under the name of terminalia benzoin. This tree, which is a native of Sumatra, is deemed in six years of sufficient age for affording the benzoin, or when its trunk acquires about seven or eight inches in diameter; the bark is then cut through longitudinally, or somewhat obliquely, at the origin of the principal lower branches, from which the drug exudes in a liquid state, and by exposure to the sun and air soon concretes, when it is scraped off from the bark with a knife or chisel. The quantity of benzoin which one tree affords never exceeds three pounds, nor are the trees found to sustain the effects of these annual incisions longer than ten or twelve years. The benzoin which issues first from the wounded bark is the purest, being soft, extremely fragrant, and very white; that which is less esteemed is of a brownish color, very hard, and mixed with various impurities, which it acquires during its long continuance upon the trees. Eschelskron distinguishes benzoin into three kinds, viz. camayan poeti, or white benjamin, which, upon being melted in a bladder by the heat of the sun, appears marked with red streaks or veins. Camayan bamatta is less white than the former, and often spotted with white circles called eyes, from the number of which its goodness is estimated: it likewise melts by the heat

of the sun. Camayan itam, or black benjamin, which requires to be melted in hot water from its preservation in bladders. In Arabia, Persia, and other parts of the east, the coarser kinds of benjamin are consumed for fumigating and perfuming the temples, and for destroying insects. The benzoin which we find here in the shops is in large brittle masses, composed partly of white, partly of yellowish or light brown, and often also of darker colored pieces: that which is clearest, and contains the most white matter, called by authors benzoe anygdaloides, is accounted the best. This resin has very little taste, impressing on the palate only a slight sweetness: its smell, especially when rubbed or heated, is extremely fragrant and agreeable. It totally dissolves in rectified spirit (the impurities excepted, which are generally in a very small quantity), into a deep yellowish red liquor, and in this state discovers a degree of warmth and pungency, as well as sweetness. It imparts, by digestion, to water also a considerable share of its fragrance, and a slight pungency: the filtered liquor, gently exhaled, leaves not a resinous or mucilaginous extract, but a crystalline matter, seemingly of a saline nature, amounting to one-tenth or one-eighth of the weight of the benzoin. Exposed to the fire in proper vessels, it yields a quantity of a white saline concrete, called stores benzoës, of an acidulous taste and grateful odor, soluble in rectified spirit, and in water by the assistance of heat. The principal use of this fragrant resin is in perfumes, and as a cosmetic; for which last purpose, a solution of it in spirit of wine is mixed with so much water as is sufficient to render it milky, as twenty times its quantity or more. It promises, however, to be applicable to other uses, and to approach in virtue, as in fragrance, to storax and balsam of Tolu. It is said to be of great service in disorders of the breast, for resolving obstructions of the pulmonary vessels, and promoting expectoration: in which intentions the flowers are sometimes given, from three or four grains to fifteen. The white powder, precipitated by water from solutions of the benzoin in spirit, has been employed by some as similar and superior to the flowers, but appears to be little other than the pure benzoin in substance; it is not the saline, but the resinous matter of the benzoin, that is most disposed to be precipitated from spirit by water. The flowers, snuffed up the nose, are said to be a powerful errhine.

2. *S. grandefolium*; 3. *S. levigatum*; these are mentioned by Aiton, in his *Hortus Kewensis*, or *Garden of Kew*.

4. *S. officinale*, the officinal storax, is the only species mentioned by Linnæus. It usually rises above twenty feet high; it sends off many strong branches, which are covered with a roughish bark of a gray color; the leaves are broad, elliptical, entire, somewhat pointed; on the upper surface smooth, and of a light green color; on the under surface covered with a whitish down; they are placed alternately, and stand upon short foot-stalks; the flowers are large, white, and disposed in clusters upon short peduncles, which terminate the branches; the corolla is monopetalous, funnel-shaped, divided at the limb into five

lance-shaped segments; the filaments are ten, placed in a regular circle, and seem to adhere towards the base; the antheræ are erect and oblong; the germen is oval, and supports a slender style, with a simple stigma: the fruit is a pulpy pericarpium, which contains one or two nuts of an oval compressed figure. The resinous drug called storax issues in a fluid state from incisions made in the trunk or branches of the tree. Two sorts of this resin have been commonly distinguished in the shops. 1. Storax in the tear is scarcely, if ever, found in separate tears, but in masses, sometimes composed of whitish and pale reddish-brown tears, and sometimes of a uniform reddish-yellow or brownish appearance; unctuous and soft like wax, and free from visible impurities. This is supposed to be the sort which the ancients received from Pamphylia in reeds or canes, and which was thence named calamita. 2. Common storax: in large masses, considerably lighter and less compact than the former, and having a large admixture of woody matter like saw-dust. This appears to be the kind intended by the London College, as they direct their styrax calamita to be purified, for medicinal use, by softening it with boiling water and pressing it out from the feces betwixt warm iron plates, a process which the first sort does not stand in need of. And indeed there is rarely any other than this impure storax to be met with in the shops. Storax, with some of the ancients, was a familiar remedy as a resolvent, and particularly used in catarrhal complaints, coughs, asthmas, menstrual obstructions, &c.; and from its affinity to the balsams it was also prescribed in ulcerations of the lungs, and other states of pulmonary consumptions. And our pharmacopœias formerly directed the pilulæ estyrace; but this odoriferous drug has now no place in any of the official compounds; and, though a medicine which might seem to promise some efficacy in nervous debilities, yet by modern practitioners it is almost totally disregarded. See LIQUIDAMBAR and STORAX.

STYRIA, a considerable province of the Austrian empire, situated between Austria Proper and Illyria, or extending from 45° 54' to 47° 50' N. lat. Its form would be nearly square, did it comprise Carinthia, a province situated to the south-west. Its extent is computed at 8500 square miles; its population, which, without being dense, is less thinly scattered than that of the northern part of Britain, is about 840,000. Its divisions are into Upper Styria towards the north, and Lower Styria towards the south. The former is subdivided into the circles of Judenburg and Bruck; the latter into those of Gratz, Marburg, and Cilly.

Upper Styria is mountainous, being in a great measure a continuation of a branch of the Alps, which, after extending eastward through Switzerland, Tyrol, and Salzburg, enter Styria at its western boundary, and continue their direction throughout its whole extent. This range rises in various parts to the height of 7000, 8000, and 9000 feet, presenting several points covered with perpetual snow. A number of ramifications extend into Lower Styria, but become gradually lower as they remove from the main chain, till they

present only small elevations, on the sides of which the vine is cultivated. The plains, however, even here, are not extensive, if we except that of Pettau, along the banks of the Drave.
